This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

LONDON ENCYCLOPÆDIA.

CÆRULESCENS, in entomology, a small species of cancer, abundant in the seas between the tropics. Also, a black species of cryptocephalus; with the striated elytræ cærulescens. Found in Barbary. Also, a species of cerambyx, inhabiting Germany. Also, a species of chrysomela, of a greenish blue color.

Cærulescens, in ornithology, a species of anas. This kind inhabits North America; the color is fuscous, beneath white; wing-coverts and posterior part of the back bluish. This is the anser sylvestris freti Hudsonis of Brisson; the blue-winged goose of Latham; l'oie des Esquimaux of Buffon. Also, a species of rallus; the blue-necked rail of Latham. A Cape of Good Hope bird.

CÆRULEUS, in entomology, a species of cimex, entirely blue, without any spots. Also, the name of a species of carabus, rhinomacer, cucajus, scarabæus, and cryptocephalus. All European insects, except the last, which is found in the tropics of Africa.

Cæruleus, in ornithology, a species of cuculus; the blue Madagascar cuckoo of Latham; and le taitson of Buffon. Also the name of a species of oriolus; the blue oriole of Latham; the Xanthornus cæruleus of Brisson; and the blue jay of Ray. Also a species of Ramphastos; the blue toucan of Latham. Found in South America.

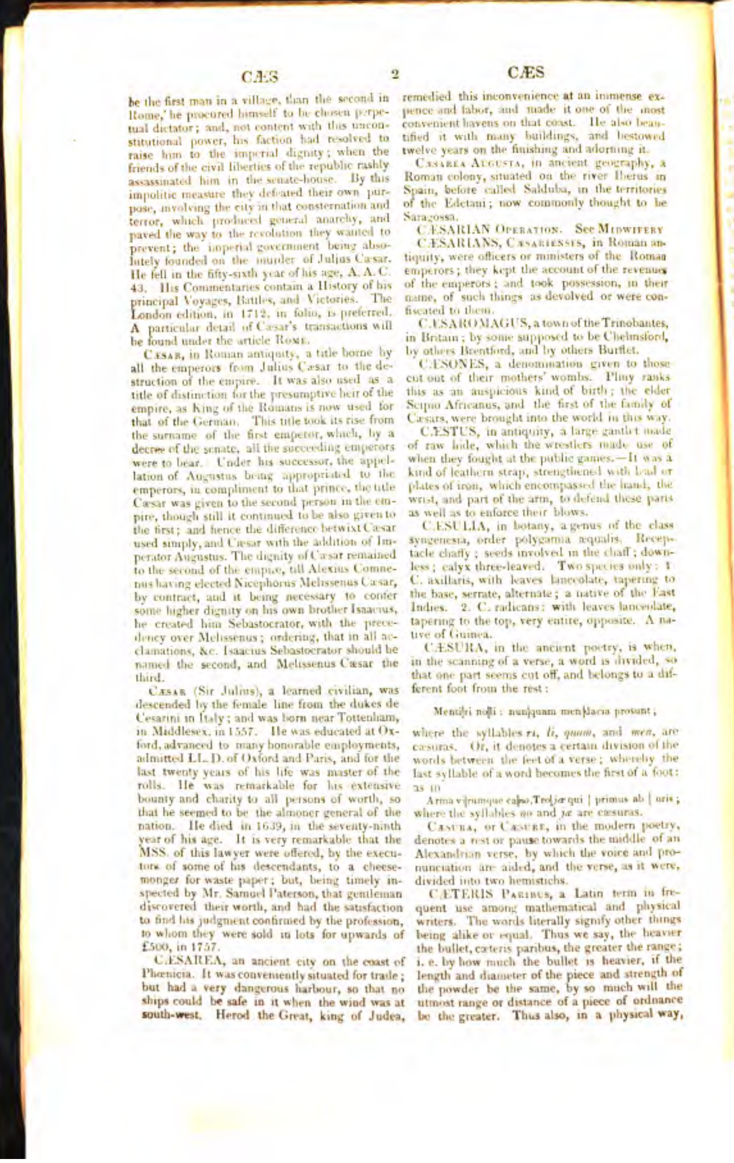
Cæruleus, in zoology, a species of coluber, the scales of which are white on one side and beneath.

CAERWYS, a parish and market town of Flint, five miles S.S.E. from St. Asaph, and 204 north-west from London. The word Caer signifies a city, and Gwys, a summons, the county assizes having been regularly held here, though now removed to Mould. In the middle of the town are four streets, in the centre stands a fine elm tree. At this place it was customary, in ancient times, for the princes of Wales to give a silver harp annually to the best bard or musician; but this custom has been discontinued ever since the reign of queen Elizabeth. The market on Tuesday is the best in the county.

CÆSALPINIA, Brasiletto, or Brasilwood, a genus of the monogynia order, and decandria class of plants; natural order thirty-third, lomentaceæ: cal. quinquefid, with the lowest segment larger in proportion. There are five petals, the lowest most beautiful It is a leguminous plant. There are nine species, the most remarkable of which are, C. Brasiliensis, commonly called brasiletto. It grows naturally in the warmest parts of America, from whence the wood is imported for the dyers who use it much. The demand has been so great, that none of the large trees are left in any of the British plantations; the largest remaining being not above two inches in thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnated; the lobes growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamina and yellow apices, growing in a pyramidal spike, at the end of a long slender stalk: the pods enclose several small round seeds. The color produced from this wood is greatly improved by solution of tin in aqua regia. 2. C. mimosa or mimosordes. Prickly leaflets, oblong, obtuse: stamens shorter than the corals, legumes woolly. A sensitive plant like the mimosa tribe, and a native of the East Indies.

CÆSALPINUS (Andrew), an eminent philosopher, physician, and botanist, was born at Arezzo. After having been many years professor at Pisa, he became physician to Pope Clement VIII. He was the author of Questiones Peripateticæ, a work, defending the philosophy of Aristotle against the doctrines of Galen, from which he appears to have approached very near to the theory of the circulation of the blood; having explained the use of the valves of the heart, and pointed out the course which these compelled the blood to take on both sides during the contraction and dilatation of that organ. He wrote also a botanical work De Plantis, and is justly esteemed the founder of Systematic Botany. His Hortus Siccus, consisting of 786 dried specimens of plants, pasted on 266 folio pages, was extant in 1740. He died at Rome in 1603.

CÆSAR (Caius Julius), the illustrious Roman general and historian, was of the family of the Julii, who pretended to be descended from Venus by Æneas. See Julius Cæsar. He was born at Rome on the 12th of the month Quintilis (afterwards from him called July) A. U. C. 653, and lost his father in 669. Being nephew to Marius, he was early proscribed by Sylla; who was with much entreaty prevailed on to save his life: but said to his friends when he consented, that 'he saw in that young man many Mariuses.' Cæsar, by his valor and eloquence, soon acquired the highest reputation in the field and in the senate. Beloved and respected by his fellow-citizens, he enjoyed successively every magisterial and military honor the republic could bestow, consistent with its free constitution. But at length having subdued Pompey, the great rival of his growing power, his boundless ambition effaced the glory of his former actions: for, pursuing his favorite maxim, 'that he had rather



be the first man in a village, than the second in Rome,' he procured himself to be chosen perpetual dictator; and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic rashly assassinated him in the senate-house. By this impolitic measure they defeated their own purpose, involving the city in that consternation and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent; the imperial government being absolutely founded on the murder of Julius Cæsar. He fell in the fifty-sixth year of his age, A. A. C. 43. His Commentaries contain a History of his principal Voyages, Battles, and Victories. The London edition, in 1712, in folio, is preferred. A particular detail of Cæsar's transactions will be found under the article Rome.

Cæsar, in Roman antiquity, a title borne by all the emperors from Julius Cæsar to the destruction of the empire. It was also used as a title of distinction for the presumptive heir of the empire, as King of the Romans is now used for that of the German. This title took its rise from the surname of the first emperor, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of Augustus being appropriated to the emperors, in compliment to that prince, the title Cæsar was given to the second person in the empire, though still it continued to be also given to the first; and hence the difference betwixt Cæsar used simply, and Cæsar with the addition of Imperator Augustus. The dignity of Cæsar remained to the second of the empire, till Alexius Comnenus having elected Nicephorus Melissenus Cæsar, by contract, and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator, with the precedency over Melissenus; ordering, that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus Cæsar the third.

Cæsar (Sir Julius), a learned civilian, was descended by the female line from the dukes de Cesarini in Italy; and was born near Tottenham, in Middlesex, in 1557. He was educated at Oxford, advanced to many honorable employments, admitted LL. D. of Oxford and Paris, and for the last twenty years of his life was master of the rolls. He was remarkable for his extensive bounty and charity to all persons of worth, so that he seemed to be the almoner general of the nation. He died in 1639, in the seventy-ninth year of his age. It is very remarkable that the MSS. of this lawyer were offered, by the executors of some of his descendants, to a cheesemonger for waste paper; but, being timely inspected by Mr. Samuel Paterson, that gentleman discovered their worth, and had the satisfaction to find his judgment confirmed by the profession, to whom they were sold in lots for upwards of £500, in 1757.

CÆSAREA, an ancient city on the coast of Phœnicia. It was conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great, king of Judea, remedied this inconvenience at an immense expence and labor, and made it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed twelve years on the finishing and adorning it.

Cæsarea Augusta, in ancient geography, a Roman colony, situated on the river Iberus in Spain, before called Salduba, in the territories of the Edetani; now commonly thought to be Saragossa.

CÆSARIAN Operation. See Midwifery

CÆSARIANS, Cæsarienses, in Roman antiquity, were officers or ministers of the Roman emperors; they kept the account of the revenues of the emperors; and took possession, in their name, of such things as devolved or were confiscated to them.

CÆSAROMAGUS, a town of the Trinobantes, in Britain; by some supposed to be Chelmsford, by others Brentford, and by others Burflet.

CÆSONES, a denomination given to those cut out of their mothers' wombs. Pliny ranks this as an auspicious kind of birth; the elder Scipio Africanus, and the first of the family of Cæsars, were brought into the world in this way.

CÆSTUS, in antiquity, a large gantlet made of raw hide, which the wrestlers made use of when they fought at the public games.—It was a kind of leathern strap, strengthened with lead or plates of iron, which encompassed the hand, the wrist, and part of the arm, to defend these parts as well as to enforce their blows.

CÆSULIA, in botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle chaffy; seeds involved in the chaff; downless; calyx three-leaved. Two species only: 1 C. axillaris, with leaves lanceolate, tapering to the base, serrate, alternate; a native of the East Indies. 2. C. radicans: with leaves lanceolate, tapering to the top, very entire, opposite. A native of Guinea.

CÆSURA, in the ancient poetry, is when, in the scanning of a verse, a word is divided, so that one part seems cut off, and belongs to a different foot from the rest:

Menti|ri no|li : nun|quam men|dacia prosunt ;

where the syllables *ri*, *li*, *quam*, and *men*, are cæsuras. Or, it denotes a certain division of the words between the feet of a verse; whereby the last syllable of a word becomes the first of a foot: as in

Arma vi|rumque ca|no, Tro|jæ qui | primus ab | oris ;

where the syllables *no* and *jæ* are cæsuras.

Cæsura, or Cæsure, in the modern poetry, denotes a rest or pause towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs.

CÆTERIS Paribus, a Latin term in frequent use among mathematical and physical writers. The words literally signify other things being alike or equal. Thus we say, the heavier the bullet, cæteris paribus, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way,

emedied this inconvenience at an immense e-
ence and labor, and made it one of the most
onvenient havens on that coast. He also beau-
ied it with many buildings, and bestowed
elve years on the finishing and adorning it.
CÆSAREA AUGUSTA, in ancient geography, a
oman colony, situated on the river Iberus in
ain, before called Salduba, in the territories
the Edetani; now commonly thought to be
agossa.

or distance of a piece of ordnance
Thus also, in a physical way,

---

we say, the velocity and quantity circulating in a given time through any section of an artery, will, cæteris paribus, be according to its diameter, and nearness to or distance from the heart.

CÆTOBRIX, in ancient geography, a town of Lusitania, near the mouth of the Tagus, on the east side; now extinct. It had its name from its fishery; and there still exist fish-ponds on the shore, made with plaster of Paris, which illustrate the name of the ruined city.

CÆYX, in mythology, a king of Thrace, who was metamorphosed into a halcyon.

CAFER, in entomology, an African species of cimex: color black, with a white band on the thorax; ferruginous wing-cases, with four white spots. Also a species of green scarabæus, with the margin of the thorax and elytræ spotted with white. Inhabiting the Cape of Good Hope.

CAFER, in ornithology, a species of merops, with gray plumage and a yellow spot near the anus, tail long. Native of Ethiopia. Also, a species of picus, brown above, beneath light green, dotted with black, the under part of the wings and tail vermilion colored. Found at the Cape of Good Hope.

CAFFA, or KAFFA, a city and port town of Russia in Europe, situated on the south-east part of Crim Tartary. It is the most considerable town in the country, and gives name to the straits mentioned below. It was anciently called Theodosia; a name which has been restored since the Russians have obtained this country. It is 150 miles north-east of Constantinople.

CAFFA, STRAITS OF, run from the Euxine or Black Sea, to the Palus Meotus, or Sea of Azoph.

CAFFACA, in natural history, a name given by the Turks and Tartars to a peculiar kind of earth, of a gray color, having a light cast of green in it. It is very soft and unctuous, and resembles our fullers' earth; but is more astringent, and adheres very firmly to the tongue; these people use this earth when they bathe.

CAFFEIN, the base of coffee. By adding muriate of tin to an infusion of unroasted coffee, M. Chenevix obtained a precipitate, which he washed and decomposed by sulphuretted hydrogen. The supernatant liquid contained a peculiar bitter principle, which occasioned a green precipitate in concentrated solutions of iron. When the liquor was evaporated to dryness, it was yellow and transparent like horn. It did not attract moisture from the air, but was soluble in water and alcohol. The solution had a pleasant bitter taste, and assumed with alkalies a garnet-red color. It is as delicate a test of iron as infusion of galls; yet gelatine occasions no precipitate with it.

CAFFER, Bos. See Bos.

CAFFER, in entomology, a Cape of Good Hope species of cerambyx; color brassy green, thorax spinous, wing-cases testaceous, and short antennæ.

CAFFILA, a company of merchants or travellers who join together, in order to go with more security through the dominions of the Grand Mogul, and other countries on the continent of the East Indies. The caffila differs from a caravan, at least in Persia; for the caffila belongs properly to some sovereign or some powerful company in Europe, whereas a caravan is a company of particular merchants, each trading upon his own account.

CAFFRA, in entomology, a species of apis, hirsute and black, with the posterior part of the thorax and anterior part of the abdomen yellow.

CAFFRA, in ornithology, a species of certhia; color fuscous, the breast and abdomen pale, and the middle feathers of the tail longest. This bird and the Caffra apis are both natives of Caffraria, whence their name.

CAFFRARIA, a country of Africa, extending across the southern part of the continent, and contained on the west between the twentieth and twenty-fifth degree of south latitude, and between the twenty-fourth and thirty-second degree of south latitude on the east. Some geographers have applied this name to the whole country lying south of Cape Negro and the River Del Spiritu Santo, and reaching toward the north, between Lower Guinea and Monomatapa, as high as the equator. But the appellation should be confined to that portion of country inhabited by the Caffres, from whom it takes its name; a people with whom we are closely connected by our colonial possessions at the Cape, and differing widely in appearance, disposition, and manners, both from the negroes as well as the Hottentots of this continent.

Of their country our knowledge is as yet defective, though it has been lately increased by the travels of Mr. Campbell and others. The Boos huanas, Barroloos, Damaras, Tambookies, and the inhabitants of Cafferland, who are particularly distinguished by the colonists of the Cape of Good Hope, by the name of Caffres, are the principal tribes of which we have any account: and it is to the latter of these that the descriptions of Paterson, Sparmann, Vaillant, and Barrow, refer.

Towards the east, this country is in many places extremely fertile. The mountains are covered with forests, and the plains with luxuriant herbage, refreshed and fertilised by innumerable streams. But towards the west it is a perfect desert. The inhabitants keep no cattle, and their whole subsistence depends upon the exchanging of copper rings and beads with the Booshuanas on the east, and the Namaqua Hottentots on the south. These rings they manufacture from copper ore, found in great abundance, in a chain of mountains extending from the Orange River to the tropic. On the banks of the Great Fish River, which is the boundary between the Cape colony and Cafferland, Mr. Barrow experienced a very remarkable variation in the temperature of the air, during the space of two days, and the climate generally is very variable, but they have little rain, except in summer, when it is accompanied by thunder and lightning.

Mr. Campbell has principally illustrated the towns of the interior, which we treat in their alphabetical places, and particularly Lekatoo, which was also visited in 1801 by commissioners from the Cape colonial government. See AFRICA.

The history and habits of the Caffres have become additionally interesting to this country since the tide of emigration has been directed eastward of our Cape colony, and their character has become, to numerous British settlers, that of the most important plunderers upon earth.

These tribes are supposed to be of Arabic origin. They call themselves Kaussis. Like the Hottentots, they are a singularly insulated race. We are persuaded from a diligent comparison of the best accounts, that, also, like the Hottentots, they are a greatly injured people, and have been goaded, by the bad usage of many generations, to the outrages they are still found to commit. The practice of the rite of circumcision alone seems to connect them with the history of the world. This they perform, like the Mahommedans, in the twelfth or thirteenth year, but connect with it no religious ceremony or notion, except that of respect to their ancestors. If they have any sort of religion besides, it is unaccompanied with any public rites. Their language is soft and harmonious, and differs much from that of the Hottentots, although the names of their mountains and rivers are evidently of Hottentot origin.

The dwellings of these people resemble beehives, constructed on a wooden frame, and plastered both within and without with a composition of clay and the dung of cattle. They are then neatly covered with a kind of matting.

Every Caffer bears arms, not as a profession, but as the exigence of his affairs seem to demand it. They are all both shepherds and warriors, as have been the greatest and the best of mankind; they evidently prefer the former mode of life, and there seems no just foundation for attributing to them a cruel or sanguinary disposition; their moderation towards the colonists, in a variety of instances, directly indicates the contrary. And of treachery they have not a shade in their character. 'Le Caffre,' says M. Vaillant, 'cherche toujours son ennemi face a face; il ne peut lancer sa bassagai, qu'il ne soit a decouvert; le Hottentot, au contraire, caché sous une roche, ou derriere un buisson, envoie la mort, sans s'exposer a la recevoir; l'un est le tigre perfide qui fond traitreusement sur la proie; l'autre est le lion genereux qui s'annonce, se montre, attaque, et perit, s'il n'est pas vainquer.' His principal weapons are the hassagai, or omkontoo, as he calls it, a sort of spear with an iron head of a foot long, fixed to a tapering shaft of about four feet in length; and the keerie. The former he throws with wonderful dexterity, seldom failing of his mark, at the distance of fifty or sixty paces. The keerie is used either in a close engagement or at a distance. It is a club of about two feet and a half long, and at one end nearly three inches in diameter. To these we may add a shield of an oval shape, made of the thickest part of a bullock's hide, which he carries to defend himself against the darts and arrows of his enemy. Unlike his neighbours, the Hottentots and Bosjesmans, he does not use poison on his weapons, and rarely attacks by surprise.

The Caffres are more attached to a pastoral than an agricultural life; though their soil, as far as it is known, and particularly to the east, offers great facilities for cultivation, and is so extremely fertile, that, with a very little labor, it might be made to produce the finest grain and fruits of the colony. So extremely negligent are they of these advantages, that a large species of water melon and millet are their principal culinary plants. They likewise cultivate some tobacco and hemp, both of which they use for smoking. They rarely kill any of the cattle for food, except to show hospitality to a stranger. Milk is their ordinary diet, which they always use in a curdled state; berries of various descriptions, and the seeds of plants, which the natives call plantains, are also eaten, and a few of the gramineous roots with which the woods and the banks of the rivers abound. Occasionally too, the palm-bread of the Bosjesmans is found amongst them. Their total ignorance of the use of ardent spirits, and fermented liquors, and their general temperance and activity, preserve them from the ravages of many disorders which abound amongst the other native tribes, to say nothing of the value of their independence. Their wealth consisting solely of their cattle they devote the principal part of their time to the management of them, which is conducted with great regularity; and even the affairs of the dairy are superintended wholly by the men. By a sharp whistling sound, made either artificially with a piece of bone or ivory, or by means of the hand applied to the mouth (as our English boys frequently make it), they contrive to inure their cattle to a sort of mechanical training. One signal of this kind disperses them in the morning to their pastures, another separates the cows from the herd to be milked, and a third collects them all for marching. Among their oxen many resemble the black cattle of the Highlands, others are as remarkable for their size, and are not unlike the Alderney cow. Some are used for riding, as they have no horses among them, and the horns of these they twist into a variety of fantastic shapes. The constructing their habitations, the breaking up of the ground and preparing it for the seed, and the gathering in of their harvest, fall to the lot of the women; who also manufacture a coarse earthenware for boiling their food, and very neat reed baskets, which serve as milk pails. The commerce of this people is divided between the Dutch farmers and their eastern neighbours, the Tambookies. To the former they bring their cattle in exchange for small pieces of copper and iron, glass beads, and other trifles; from the Tambookie nation they procure their wives.

Previous courtship is not considered necessary to marriage. When a man once selects the object of his wishes, nothing remains but to strike a bargain with the father; the amount of which is generally an ox or a couple of cows; and the damsel resigns herself to her fate, without emotion or surprise. The Tambookie wives, however, are thought rather a dear commodity; they are rarely obtained but by the chiefs; and, among the common people, this custom of purchasing wives renders polygamy, though allowable, not frequent, as they can seldom afford the price of more than one. Their marriages are celebrated with feasts and dancing, which not unfrequently last for weeks together. 'A Caffre woman,' Mr. Barrow says, 'is only serious when she dances; and at such times her eyes are constantly fixed on the ground, and her whole body seems to be thrown into convulsive motions.'

The government of the Caffres is monarchical, but administered by various subordinate chiefs, who are distinguished from the people at large by a brass chain suspended on the left side of the head, from a wreath of copper beads. The regal honor descends from father to son; in default of the latter to a nephew; and, in default of both, it becomes elective, an occasion, when it occurs, of considerable strife. Their rulers seem to have no control, however, over the lives or properties of those they govern. Their laws, apparently suggested by natural principles, are very few and simple. If the death of a fellow creature be the effect of accident, a fine is paid to the relatives of the deceased, but premeditated murder is visited with instant death. Of imprisonment for any crime they have no conception; restitution is the punishment inflicted for theft; and the same laws, in cases of their delinquency, are applied equally to the chiefs and to their subjects.

Mr. Barrow, in the course of his first expedition into Caffre-land, penetrated to the capital, which is not far east of the Fish River, and conducted a negociation with their king Gaika, of which he gives a very interesting account. Having waited for some time in conversation with the mother of this chief, about thirty-five, and his queen, a very pretty girl of fifteen, the king made his appearance on an ox in full gallop, attended by five or six of his people. Business commenced, with little ceremony, under the shade of a mimosa. Anticipating, with great promptitude and ease of manner, the general object of the visit, he began by observing, that none of the Caffres who had passed the frontier were to be considered as his subjects. 'He said they were chiefs as well as himself, and entirely independent of him; but that his ancestors had always held the first rank in the country, and their supremacy had been acknowledged by the colonists on all occasions; that all those Caffres and their chiefs who had a long time been desirous to enter under the protection of his family had been kindly received, and that those who chose rather to remain independent had been permitted to do so without being considered in the light of enemies.' He then entered as freely into the history of his family. 'He informed us,' continues Mr. B. 'that his father died and left him when very young, under the guardianship of Zembei, one of his first chiefs, and his own brother, who had acted as regent during his minority; but that having refused to resign to him his rights, on coming at years of discretion, his father's friends had showed themselves in his favor, and by their assistance he had obliged his uncle to fly; that this man had then joined Khootar, a powerful chief to the northward, and with their united power had made war upon him: that he had been victorious and had taken Zembei prisoner.' Instead of a cruel death, which we should have imagined the uncle now to have been exposed to, he was treated it seems with great lenity and respect, his wives and children were returned to him and he was only so far considered a captive as never to be suffered to leave the village in which the king resided.

They have some singular practices in the interment of their dead. The bodies of their children are deposited in ant-hills, which have been excavated by the ant-eater. On their chiefs only is bestowed the honor of a grave, which is generally dug very deep in the places where their oxen stand during the night; the rest of their dead are thrown promiscuously into a ditch, and left without covering to be devoured by the wolves, whom the Caffres never attempt to destroy, from a consideration of their services. With this apparent neglect of their bodies, a Caffre not only cherishes great respect for his deceased relatives, but to swear by their memory is to take the most sacred oath.

The Caffre women possess cheerful and animated countenances, are modest in their carriage, lively and curious, but not intruding; and, though of a color nearly approaching to black, their well-constructed features, their beautifully clean teeth, and their eyes dark and sparkling, combine to render many comparatively handsome. They have neither the thick lips nor the flat noses of African negroes. As the females of a nation but partially civilised, they are remarkable for a sprightly and active turn of mind, and in this respect are totally different from their neighbours the Hottentots. In point of general figure, however, the latter seem to have the advantage in their youth.

The men are tall, muscular and robust, of an open countenance, and manly graceful figure. Good nature and intelligence are depicted in their features, which never betray any signs of fear or suspicion. Their hair, which is short and curling, and their skin, which is nearly black, are rubbed over with a solution of red ochre; and though a few wear cloaks of skin, most of them go quite naked. The women wear cloaks that extend below the calf of the leg; and their head-dress, which is a leather cap, is adorned with beads, shells, and polished pieces of iron or copper.

CAFFRISTAN, or Kuttore, an extensive mountainous region of India, bounding Cabul to the north, and extending northward from the thirty-fifth degree of latitude to Cashmere. The general level of this country is considerably above those on each side of it. Kuttore is the general name of this tract; that of Caffristan signifies the land of infidels. It is classed as a dependency of Cashgar, by the people of Hindostan, but is little known to them. It seems to be governed by a number of petty chieftains, and has members worth the attention of the various enquirers of the neighbourhood.

CAGANUS, or Cacanus, an appellation anciently given by the Huns to their kings. The word appears also to have been formerly applied to the princes of Muscovy, now called czars. From the same also, probably, the Tartar title cham or kan, had its origin.

CAGAO, in natural history, the Indian name of a large bird which inhabits the mountains, and feeds on pistachio nuts, and other fruit which it swallows whole. It is very voracious, and is of the size of a hen, but has a longer neck.

CAGE, *v.* & *n.* Fr. *cage*; Ital. *gaggia*, *gabbia*; Belg. *kovi*; Lat. *cavea*; a place of confinement; a prison; a coop for birds; generally a place shut in and fastened.

Take any bird and put it in a *cage*,
And do all thin entente and thy corage,
To foster it tenderly with mete and drinke
Of all deintees that thou canst bethinke,
And keepe it all so clenely as thou may;
Although the *cage* of gold be never so gay,
Yet had this bird, by twenty thousand fold,
Lever in a forest that is wide and cold,
Gon eten worms, and swiche wretchednesse;
For ever this bird will don his besinesse
To escape out of this *cage* whan that he may:
His libertee the bird desireth, ay.
Chaucer's Canterbury Tales.

See whether a *cage* can please a bird? or whether a dog grow not fiercer with tying? *Sidney.*

He taught me how to know a man in love; in which *cage* of rushes, I am sure you are not a prisoner. *Shakspeare.*

He swoln, and pampered, with high fare,
Sits down, and snorts, *caged* in his basket chair.
Donne.

Have you not seen the nightingale
A prisoner like coopt in a *cage*;
How doth she chant her wonted tale
In that her narrow hermitage;
Even then her charming melody doth prove
That all her bars are trees, her *cage* a grove.
Old Song. Sir R. L'Estrange.

The bird in thrall, the more contented fyes,
Because the hawke so neere her she espyes,
And though the *cage* were open, more would feare
To venture out than to continue there;
So if thou couldst perceive what birds of prey
Are hovering round about thee every day,
To seize thy soule (when she abroad shall goe,
To take the freedome she desireth so),
Thou farre more fearfull, wouldst of them, become
Then thou art now of what thou flyest from.
George Withers.

Though slaves, like birds that sing not in a *cage*,
They lost their genius, and poetick rage;
Homers again and Pindars may be found,
And his great actions with their numbers crowned.
Waller.

And parrots, imitating human tongue,
And singing birds in silver *cages* hung;
And every fragrant flower, and odorous green,
Were sorted well, with lumps of amber laid between.
Dryden.

The reason why so few marriages are happy, is, because young ladies spend their time in making nets, not in making *cages*. *Swift.*

A man recurs to our fancy, by remembering his garment; a beast, bird, or fish, by the *cage*, or court-yard, or cistern, wherein it was kept.
Watts on the Mind.

The yelping cur her heels assaults;
The magpie blabs out all her faults;
Poll in the uproar, from her *cage*,
With this rebuke outscreamed her rage. *Gay.*

So settling on his *cage*, by play,
And chirp, and kiss, he seemed to say,
You must not live alone.
Nor would he quit that chosen stand,
Till I with slow and cautious hand,
Returned him to his own.
Cowper. The Faithful Bird.

You gave me last week a young linnet,
Shut up in a fine golden *cage*;
Yet how sad the poor thing was within it—
O how did it flutter and rage;
Then he moped and he pined,
That his wings were confined,
Till I opened the door of his den;
Then so merry was he,
Because he was free,
He came to his *cage* back again.
Garrick.

CAGES, CAVEÆ, in antiquity, were places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. These beasts were usually brought to Rome shut up in oaken or beechen cages, artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. The fiercer sort were pent in iron cages, lest wooden prisons should be broke through. The caveæ were a sort of iron cages different from dens, which were under ground and dark; whereas the caveæ being airy and light, the beasts rushed out of them with more alacrity and fierceness than if they had been pent under ground. Iron cages have been formerly used for the security or punishment of prisoners. Bajazet is said to have died in one when prisoner to Timour the Tartar, but the correctness of this idea is doubted, and seemingly on good grounds, by some historians. They were used in France by Louis XIV., and in England by Edward I., who confined the countess of Buchan in this manner, at the castle of Berwick-upon-Tweed.

CAGGAW, in botany, a name given by the people of Guinea, to a plant which they boil in water, and use the decoction to wash the mouth with, as a cure for the tooth-ache. Its leaves are smooth and shining, like those of the laurel, but they are thin, and bend like those of the bay.

CAGIT, in natural history, a name given by the people of the Philippine Islands, to a species of parrot, very common in their woods; it is of a middling size, and is all over of a fine green color.

CAGLIARI, the capital of the island of Sardinia, is seated on the declivity of a hill, has a university, and is an archbishop's see. The harbour, which is at the mouth of the river Mulargia, is excellent, and the town has a good trade; but it is a place of no strength, and small size. It was taken, with the whole island, by the English in 1708, who transferred it to the emperor Charles VI.; but it was retaken by the Spaniards in 1717, and about two years afterwards ceded to the duke of Savoy, in lieu of Sicily. The objects of traffic are salt, oil, and wine. Inhabitants about 30,000.

CAGLIARI (Paul), called also Paulo Veronese, an excellent painter, born at Verona, in 1532. Gabriel Cagliari, his father, was a sculptor, and Antonio Badile, his uncle, was his master in painting. He was esteemed the best of the Lombard painters, and styled, il pittor felice, the happy painter. There is scarcely a church in Venice where some of his performances are not to be seen. De Piles says, 'his picture of the marriage at Cana, is almost the triumph of

painting itself.' Philip II. of Spain, sent for him to paint the Escurial, and made him great offers; but Paul excused himself from leaving his own country, where his reputation was so well established, that most of the princes of Europe ordered their ambassadors to procure something of his hand at any rate. Titian used to say, he was the ornament of his profession. And Guido Reni being asked which of his predecessors he would choose to be, were it in his power, after Raphael and Corregio, named Paul Veronese. He died of a fever at Venice in 1588, and had a tomb and a statue of brass erected to his memory in the church of St. Sebastian.

CAHIRCONRIGH, a conical mountain of Ireland, in Kerry, Munster, more than 700 yards above the sea level, and forming a sort of peninsula between the bays of Castlemayn and Tralee.

CAHILLO, in ichthyology, a name given by some authors to the lupus marinus, or wolf fish.

CAHORS, a considerable walled town of France, in the department of the Lot, and ci-devant province of Querci. It is seated on a peninsula of the river, and built partly on a craggy rock. The principal street is narrow; and terminates in the market-place, in which is the town-house. The cathedral is a Gothic structure, and has a large square steeple. It has a university, and is forty-five miles north-west of Toulouse. It has a population of 11,728 inhabitants; and manufactures of woollen and fine linen, brandy, and oil. In the vicinity is raised the celebrated vin de grave. It had formerly a university, and is still a bishop's see.

CAHYS, a dry measure for corn, used in some parts of Spain, particularly at Seville and at Cadiz. It is near a bushel of our measure.

CAIA, in Roman antiquity, a common prænomen among the women, as Caius was among the men. Hence the custom of the bride saying, on being introduced into her husband's house, 'Ubi tu Caius, ego Caia,' i. e. 'Where you are master, I will be mistress.'

CAIA, in the Turkish military orders, an officer serving in the post of a deputy or steward, and acting for the body of janissaries.

CAJA, in entomology, the specific name of the garden tiger moth, a well-known species of phalæna. The anterior wings are whitish, with large fuscous spots: posterior ones red, with black spots.

CAJANA, a town of European Russia, in Finland, the capital of the district of Cajana Lehn. It stands on lake Ulea, on the borders of Lapland, where the Pytha forms a tremendous cataract. The inhabitants gain their living by tillage. It is seventy-two miles south-east of Uleaborg.

CAIANI, in ecclesiastical history, a sect of heretics, thus denominated from one Caianus of Alexandria, their leader, otherwise called Aphthartodocetæ.

CAJANIA, a province of Sweden, the same with East Bothnia. See BOTHNIA.

CAIAPHAS, high priest of the Jews, succeeded Simon, the son of Camith, about A. D. 16, or as Calmet thinks, in 25, and married the daughter of Annas, who was conjoined with him in the priestly office. His iniquitous conduct with regard to our Saviour, with his strong, though undesigned, expression of the necessity of one dying to save others, are recorded by the evangelists. About two years after our Saviour's death, Caiaphas and Pilate were both deposed by Vitellius, then governor of Syria, and afterwards emperor: whereupon Caiaphas, unable to bear this disgrace, killed himself, A. D. 35. See ANNAS.

CAIC, CAICA, or CAIQUE, in sea language, is used to denote the skiff or sloop belonging to a galley. The Cossacs give the same name to a small kind of bark used in the navigation of the Black Sea. It is equipped with forty or fifty soldiers; their employment is a kind of piracy.

CAICOS, a cluster of islands in the Atlantic, between St. Domingo and the Bahama islands, on the edge of one of the Bahama banks. North of this bank are four or five islands of considerable extent. The largest, called the Grand Caicos, is due north from St. Domingo, and about 400 miles from New Providence; about sixty miles long, and two or three broad. There are here several good anchorages, particularly that at St. George's Key, where there is a port of entry, and a small battery. The harbour admits vessels drawing fourteen feet water. But none of the settlements are very flourishing. Long. 72° W., lat. 21° N.

CAICUS, in entomology, a species of sphinx, inhabiting Surinam. Color of the wings fuscous: posterior pair rufous, streaked with black; abdomen cinerous, with black rings.

CAJEPUT OIL, the volatile oil obtained by distillation from the leaves of the cajeputa officinarum, the melaleuca leucadendron of Linnæus, frequent on the mountains of Amboyna, and other Molucca islands. It is prepared in great quantities, and sent to Holland in copper flasks. As it comes to us, it is of a green color, from the copper of the flasks; very limpid, lighter than water, of a strong smell resembling camphor, and a strong pungent taste, like that of cardamoms, and is often adulterated with other essential oils, colored with the resin of milfoil. It burns entirely away, without leaving any residuum. In medicine it is used as a general stimulant and antispasmodic. Hence it is recommended in flatulent colic, paralysis, chorea, hooping cough, and convulsive disorders in general. The dose is from one to six drops. It is also of considerable use externally applied for the relief of toothache, rheumatic pains, sprains, &c. Insects have a great aversion to this oil; the vapor of which appears to intoxicate and kill them. Cajeput oil is a perfect solvent of caoutchouc, from which solution a fine drying varnish may be made.

CAJETA, in ancient geography, a port and town of Latium, so called from Æneas's nurse; now called Gaeta.

CAJETAN (Cardinal), was born at Cajeta, in Naples, in 1469. His proper name was Thomas de Vio; but he adopted that of Cajetan from the place of his nativity. He defended the authority of the pope, which suffered greatly at the council of Nice, in a work entitled, Of the Power of the Pope; and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palermo, and in 1517 was made a cardinal by pope Leo X. The year after, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther; but Luther, under protection of Frederic, elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons in repairing to Augsburg, yet he rendered all his proceedings ineffectual. He died in 1534. He wrote Commentaries upon Aristotle's Philosophy, and upon Thomas Aquinas's Theology; and made a literal Translation of the Old and New Testament.

CAIFA, Caipha, or Haifa, a sea-port town of Palestine, on the south side of the bay of Acre. From a poor village this has sprung up on the ruins of an ancient city, at the foot of Mount Carmel. It is built without plan, and defended by walls on the land side, which were constructed by Daher, a late chief of Acre; he also established a custom-house here, at a time when the port of Acre was choked. It is now governed by an Arab; the inhabitants are Mahommedans and Greeks. In March, 1799, the Turks evacuated Caifa at the approach of the French general, Kleber, leaving abundant stores in the place. The French established a garrison here, and built ovens for the use of the army, which the British soon after made an unsuccessful attempt to destroy. Distant thirteen miles south-west of Acre.

CAI-FONG, or Kai-fong, a city of China, the capital of the province of Honan. It stands only two leagues from the Hoang-ho, or Yellow River, and is situated so low that the bed of the river is higher ground than the city, and, to guard against inundations, strong dykes or embankments have been constructed, which extend above ninety miles. When it was besieged by 100,000 rebels, in 1642, the commander of a body of forces sent for its relief, resolved to attempt drowning the enemy, by breaking down the embankment. His stratagem was successful; but, while the enemy was destroyed, the inundation overwhelmed also the city, and 300,000 of the inhabitants perished. At that time it was nine miles in circumference. It has been subsequently re-built, but in an inferior style. Its jurisdiction comprehends four cities of the second class, and thirty of the third. Distant 315 miles south-west of Pekin.

CAILLE (Nicholas Louis de la), an eminent mathematician and astronomer, was born at Rumigny, in the diocese of Rheims, in 1713. In 1729 he went to Paris, where he studied the classics, philosophy, and mathematics. Afterwards he studied divinity at the college of Lisieux, was ordained a deacon, and officiated in the church of the college of Mazarin several years; but he never entered into orders, apprehending that his astronomical studies might too much interfere with his religious duties. In 1739 he was conjoined with M. de Thury, son of M. Cassini, in verifying the meridian of the royal observatory, through the whole kingdom of France. In November, the same year, whilst he was engaged in the operations which this grand undertaking required, he was elected into the vacant mathematical chair, which the celebrated M. Varignon had so worthily filled. Here he began to deliver lectures about the end of 1740; and an observatory was erected for his use in the college, and furnished with the best instruments. In May 1741, he was admitted into the Royal Academy of Sciences, as an adjoint member for astronomy. Besides many excellent papers in their memoirs, he published Elements of Geography, Mechanics, Optics, and Astronomy. He carefully computed all the eclipses of the sun and moon that had happened since the Christian era, which were printed in a book published by two Benedictines, entitled L' Art de Verefier les Dates, &c., Paris, 1750, in 4to. Besides these, he compiled a volume of Astronomical Ephemerides, from 1745 to 1755; another from 1755 to 1765; a third from 1765 to 1775; an excellent work, entitled Astronomiæ Fundamenta Novissimis Solis et Stellarum Observationibus Stabilita; and the most correct solar tables that ever appeared. Having gone through a seven years series of astronomical observations in his own observatory, he formed a project of going to observe the southern stars at the Cape of Good Hope. This was highly approved of by the academy, and by the prime minister Comte d' Argenson, and readily agreed to by the states of Holland. At length, on the 21st of November, 1759, he sailed for the Cape, and arrived there on the 19th of April, 1751. Here he accomplished the measurement of a degree of latitude, and returned to Paris the 27th of September, 1754; and at his coming into port, he refused a bribe of 100,000 livres, offered by one that thirsted less after glory than gain, to be sharer in his immunity from custom-house searchers. After receiving the congratulatory visits of his more intimate friends and the astronomers, he drew up a reply to some strictures, which professor Euler had published relative to the meridian, and then he settled the results of the comparison of his own, with the observations of other astronomers, for the parallaxes. His fame was now established upon a firm basis, and he was unanimously elected a member of the Royal Society at London; of the institute of Bologna; of the Imperial Academy at Petersburgh; and of the royal academies of Berlin, Stockholm, and Gottingen. In 1760 he was attacked by a severe fit of the gout; which, however, did not interrupt his studies; for he then planned out a History of Astronomy, through all Ages, with a Comparison of the Ancient and Modern Observations, and the Construction and Use of the Instruments employed in making them. In order to pursue this task, in a suitable retirement, he obtained a grant of apartments in the royal palace of Vincennes; and whilst his astronomical apparatus was erecting there, he began printing his catalogue of the southern stars, and the third volume of his Ephemerides. The state of his health was, towards the end of 1763, greatly reduced. This induced him to settle his affairs; his MSS. he committed to the care and discretion of his esteemed friend M. Maraldi. It was at last determined that a vein should be opened: but this brought on an obstinate lethargy, of which he died, aged forty-nine.

CAILLOMA, a town of Peru, in the province of Collahuas, famous for the silver mines of its neighbourhood. The country around is barren, but the mountains are supposed to contain many untouched veins of precious metal. It is forty-six miles N. N. E. of Arequipa.

CAIMACAN, or **Caimacam**, in the Turkish affairs, a dignity in the Ottoman empire, answering to lieutenant or rather deputy, among us. There are usually two caimacans; one resides at Constantinople, as governor thereof; the other attends the grand vizier in quality of his lieutenant, secretary of state, and first minister of his council, and gives audience to ambassadors Sometimes there is a third caimacan, who attends the sultan; whom he acquaints with any public disturbances, and receives his orders concerning them.

CAIMAN, the American name of a crocodile.

CAIN, the eldest son of Adam and Eve, and the first man born into this world. He is generally styled the first murderer; but, although it is certain that he killed his brother Abel, it appears by no means equally certain that he intended it. Death, except that of the beasts sacrificed by Abel, was then hardly known; and the extent of suffering which the human body could bear, without inducing death, was totally unknown. It seems, therefore, probable, that Cain had killed his brother in a fit of passion, when he intended nothing more than a severe drubbing. This seems further confirmed by the punishment inflicted on him by the Searcher of hearts; which was only banishment, a punishment often inflicted since for manslaughter. He is the first builder on record. Philo pretends that he built seven cities.—*Alsted. Chron.* p. 257.

CAINAN, or **Kenan**, the son of Enoch, great-grandson of Adam, and the fourth of the Antediluvian patriarchs, was born A. M. 325: begat Mahalaleel in 395, and died in 1235, aged 910. There was another Cainan, the son of Arphaxad, and father of Salah; mentioned only in the Septuagint, Gen. x. 24., and xi. 12; and in Luke, iii. 36: of this name no notice is taken in the Hebrew text, the Samaritan, or the Vulgate.

CAINIANS, or **Cainites**, a sect of heretics in the second century, so called on account of their great respect for Cain, and Judas, and others of the same class, who, according to them, had a mighty knowledge of all things. Dr. Lardner, however, disputes the credibility of the relations, of Epiphanius and Irenæus, concerning this people.

CAJOLE', *v.* }
Cajol'er, }
Cajol'ery, *n.* } Fr. *cajoler;* Goth. *goela*, *gagoela*, to entice. See to Gull. It describes a purpose, and that of the worst kind, deception; to cajole is to entrap by flattery, coaxing and wheedling.

> The one affronts him, while the other *cajoles* and pities him: takes up his quarrel, shakes his head at it, clasps his hand upon his breast, and then protests and protests. *L'Estrange.*

> Thought he, 'tis no mean part of civil
> State prudence, to *cajole* the devil. *Hudibras.*

> A plan to rob the house was laid,
> The thief with love seduced the maid;
> *Cajoled* the cur, and stroked his head,
> And bought his secresy with bread.
>
> *Gay.*

> If the king were present, Cleon, there would be no need of my answering to what you have just proposed. He would himself reprove you for endeavouring to *cajole* him into an imitation of foreign absurdities, and for bringing enmity upon him, by such unmanly flattery. As he is absent, I take upon me to tell you, in his name, that no praise is lasting but what is rational.
>
> *Q. Curtius.* Trans.

CAIQUE. See Caic.

CA Ira, French, the name, or rather chorus of a political French song, very popular all over France, in the beginning of the revolution. The words literally signify, it will do, or it will go on, and are said to have been used almost proverbially by the late Dr. Franklin, concerning the American revolution; from which circumstance they were adopted as the chorus of the French revolution song. Songs, however, as well as states, are subject to revolutions. This song and the Marseilloise hymn, another popular French song, were both prohibited from being sung in public by the French directory, soon after the revolution in September 1797, they being considered as rallying signs of the party in opposition.

CAIRNS, or **Carnes**, the vulgar name of those heaps of stones which are to be seen in many places of Britain, particularly Scotland and Wales. They are composed of stones of all dimensions, thrown together in a conical form, a flat stone crowning the apex. Various causes have been assigned by the learned for these heaps of stones. They have supposed them to have been, in times of inauguration, the places where the chieftain elect stood to show himself to best advantage to the people; or the place from whence judgment was pronounced; or to have been erected on the road side in honor of Mercury; or to have been formed in memory of some solemn compact, particularly where accompanied by standing pillars of stones; or for the celebration of certain religious ceremonies. Such might have been the reasons, in some instances, where the evidences of stone chests and urns are wanting: but these are so generally found that they seem to determine the most usual purpose of the piles in question to have been for sepulchral monuments. Even this destination might render them suitable to other purposes, particularly religious, to which by their nature they might be supposed to give additional solemnity According to Toland, fires were kindled on the tops of flat stones, at certain times of the year, particularly on the eves of the first of May and the first of November, for the purpose of sacrificing; at which time all the people having extinguished their domestic fires, rekindled them from the sacred fires of the cairns. In general, therefore, these accumulations appear to have been designed for the sepulchral protection of heroes and great men. The stone chests, the repository of the urns and ashes, are lodged in the earth: sometimes only one, sometimes more, are found thus deposited; and Mr. Pennant mentions an instance of seventeen being discovered under the same pile. Cairns are of different sizes, some of them very large. Mr. Pennant describes one in the island of Arran 114 feet over, and of vast height. They may justly be supposed to have been proportioned in size to the rank of the person, or to his popularity: the people of a whole district assembled to show their respect to the deceased; and, by an active honoring of his memory, soon accumulated heaps equal to those that astonish us at this time. But these honors were not merely those of the day; as long as the memory of the deceased endured not a passenger went by without adding a stone to the heap; they supposed it would be an honor to the dead, and acceptable to his manes. To this moment there is a proverbial expression among the Highlanders, allusive to the old practice: a suppliant will tell his patron, 'Curri mi doch er do charne,' 'I will add a stone to your cairn;' meaning, when you are no more, I will do all possible honor to your memory. Cairns are to be found in all parts of our islands, in Cornwall, Wales, and all parts of north Britain; they were in use among the northern nations; Dahlberg, in his 323d plate, has given the figure of one. In Wales they are called carneddau: but the proverb taken from them there, is not of the complimental kind: 'Karn ar dy hen,' or, 'A cairn on your head,' is a token of imprecation.

CAIRO, or GRAND CAIRO, (Victorious), sometimes called the queen of cities, stands upon the east bank of the Nile, a little above the Delta, or plain of Lower Egypt. Founded, according to the oriental writers, in the sixteenth century, it received its present name from Moaz, the first caliph, in memory of his conquest of Egypt. Here he erected a splendid palace; but two centuries elapsed before Cairo could be considered as anything but the famed residence of a military sovereign. In the Crusades the neighbouring capital of Egypt, Fostat, was reduced to ashes, to disappoint the Christians of their booty; and the inhabitants sought an asylum in Cairo, which from that period became the capital of this country. It was greatly enlarged, adorned, and fortified, by the emperor Saladin, and was in the height of its prosperity about the commencement of the fifteenth century. As a central emporium for the trade of Europe and Asia, and closely connected with Alexandria, it was a first rate commercial city, and respectable also for men of science and learning. But the conquest of Egypt by the Turks, and the discovery of a passage to India by the Cape of Good Hope, diverted this flourishing trade, and all the intercourse of Europe with the east into a different channel, and caused a decline from which it has never arisen. But Cairo is still described as a large city, equal in extent to Paris. It is of a crescent form, more than nine miles in circumference; and seen from the Nile, from which it is about a mile distant, it presents a most magnificent scene, in which the citadel towering above innumerable other lofty edifices, and countless minarets, all springing as it were out of a grove of the richest foliage, are the most conspicuous objects. On a nearer approach the streets are found to be crooked, narrow, and unpaved; and from the crowds of men and animals, pressing along through dust and filth, are any thing but agreeable. The houses are chiefly of wood, or unburnt bricks dried in the sun, and consist only of a single story. Some, however, are constructed of a soft stone. The houses are crowded into groupes, with large intervening spaces, all of which, as well as the courts and gardens within the walls, are covered with water by the welcome inundation of the Nile. The terraced roofs of the houses are described by Sonnini as covered with innumerable turtle doves, crows, kites, and vultures, which are never disturbed by the inhabitants, and consequently exhibit a degree of tameness and familiarity which appears surprising to an European. In the interior the better houses have a large hall, rising the whole height of the house, and covered with a small dome. Every thing here is arranged with a view to coolness; the floor is inlaid with marble and colored earthenware, and fountains spring up into marble basins. Mats and mattresses cover the floor, over which is spread a rich carpet, on which they sit cross-legged. Around the wall is a sort of sofa with cushions, to support the back and elbows; and above, at the height of seven or eight feet, a range of shelves adorned with porcelain. The walls are either chequered with sentences from the Koran, or with painted foliage and flowers. The windows have neither glass nor moving sashes, but open lattice work, which frequently costs more than our glazing; and into which a dim light enters from the inner courts, pleasingly qualified by their verdure. The widest street in Cairo is one which traverses the whole length of the city, but would be regarded only as a lane in Europe. The others are so narrow, that a slight covering is frequently thrown over them, to exclude the sun's rays. Most of the streets, or at least every district, has a gate which is shut as soon as it is dark. A canal supplied by the Nile, called the Calisch, and which is from fifteen to twenty feet broad, runs through the city. Its mouth, when the waters of the river begin to increase, is closed by a mound of earth, which is not removed till they have risen to a certain height. The opening then takes place, and a magnificent festival is celebrated on the occasion. The bashaw places himself in a tent, which stands by the side of the canal; nuts, melons, and some small coins, are thrown in, and a discharge of fire-works takes place. From the river to the city the canal is only an ill kept ditch, without any lining, or even any regular boundary. The Arabs indeed assert, that it is paved with marble, but if so, it is entirely concealed beneath the mud. Along the line of it, in the city, there are a number of large squares, from a quarter to three quarters of a mile round, into which its water is conducted. During the season of inundation, these of course bear the appearance of lakes, and, being bordered by the finest houses in Cairo, present a scene of great beauty, especially when covered with pleasure boats and barges, and enlivened by music and fire works. When the inundation subsides the lake becomes a marsh, and a repository of mud, from which the most offensive vapors exhale. The whole, however, is quickly dried up by the intense heat of the sun, and it is then soon covered by luxuriant vegetation. It now often becomes a theatre for those exhibitions which form the delight of the inhabitants; and in which

elight of the inhabitants; and in which

jugglers, tumblers, mountebanks, and dancing girls, display in succession their various feats. The citadel, which stands on a rocky eminence, is three miles in circumference, and affords one of the most splendid views in Egypt. It includes the palace of the paçha, the barracks of the janissaries, and some remains of antiquity; among which is Joseph's well, dug to the depth of 276 feet through the solid rock. The diameter of the well varies at different depths, and, where it is contracted, stages are formed for oxen to drive a wheel for raising the water. A huge pile of building within the citadel is called Joseph's palace, the great hall of which has been much admired.

Among the other public buildings of this city, the reservoirs for water, and the baths, are worth notice; the warehouses as well as the market places, are spacious and commodious; but the mosques, of which more than 300 are erected within the walls, form, with their numerous and lofty minarets, the chief ornament of the place. The Jews have a synagogue here, and the Greeks, and other sects of Christians, places of worship.

A caravan arrives at Cairo from Abyssinia, loaded with the rich productions of the interior of Africa, and, being joined by another from the western part of Africa, it proceeds towards Arabia. This perilous journey is undertaken partly for religious, and partly for commercial purposes. Having performed the prescribed ceremonies at the holy city, and exchanged their merchandise for the commodities of the east, the immense body of travellers, amounting, it is said, sometimes to 100,000, return from Mecca by the same route. Its manufactures are linen cloth, silk stuffs, sugar, sal-ammoniac, salt-petre, and coarse gunpowder; glass lamps, and several kinds of leather. The mode of hatching chickens by means of artificial heat, which has been long known in Egypt, is still practised here. Cairo also contains a book-market, where a prodigious number of beautiful manuscripts are exposed for sale. Here Dr. Clarke purchased for seven pounds a complete copy of the Arabian Nights, having many tales which have not been translated into the European languages; but it was unfortunately lost. Many of the Mamelukes collect large and expensive libraries. The police here is well managed, and a general quiet results. The principal occasions on which it is disturbed, are those of marriage and circumcision. The bride, a few days before the ceremony, walks in procession to the bath, where she remains till the nuptials, when a second procession takes place. On these occasions, all the magnificence which a family is able to display is ostentatiously paraded. The bride, preceded by a band of music, walks below a magnificent canopy, surrounded and followed by numerous attendants. Every article of finery which can be collected is carried by the attendants, a small portion being assigned to each. The processions for the other purpose are also splendid, and attended by numerous horsemen and bands of music.

The population of Cairo is variously stated, from the extreme amounts of 250,000, 300,000, to 700,000, souls; it is composed of people of all countries and religions. Among those of oriental origin, and who have it in their power to indulge in them, the luxurious manners and customs of the east prevail. Sailing on the Nile is one great amusement of all classes in Cairo, and vessels of a light construction are elegantly fitted up for this purpose. Boulac, about a mile to the west of Cairo, on the right bank of the river, is its principal port. It suffered severely from the French, who plundered and burned it to the ground.

About a mile distant, higher up the river, stands Fostat, or Old Cairo, as it is sometimes called, formerly the capital of Egypt, and still a populous place. The great canal, which formed a communication between the Nile and the Red sea, passes off from the river near this place, and proceeds towards Cairo, where it divides the city as we have already mentioned. This place is inhabited in a great measure by Copts, who have twelve churches, and, among others, one of peculiar sanctity, which they report to have been the residence of the Virgin Mary, when she was compelled to fly into Egypt. Their churches generally consist of a nave and two aisles, with galleries supported by pillars, and adorned in front with columns that support the roof. The part containing the altar is separated by a partition that is finely adorned with carving, and inlaid with ivory and tortoise-shell. The patriarch of the Coptic church is established at Old Cairo. A street is called by his name, in which is the church of St. Macarius, where he is elected and enthroned. The Jews have also an ancient synagogue here. Dr. Pococke saw two ancient manuscripts of the law, and a manuscript of the Bible amongst them, pretended to have been written by Ezra. To the north-east there is an ancient mosque, called Amrah, said to contain nearly 400 pillars, collected from various more ancient edifices. In Old Cairo are granaries, which are honored with the name of Joseph; they are square courts, surrounded with walls fifteen or twenty feet high, and without any roof. The grain is only covered with matting, which ill protects it from birds, for whose depredations an allowance is said to be made to the keepers The aqueduct, a rustic edifice, by which water is conveyed to the castle of New Cairo, is a superior work; it is a hexagon building, each side being eighty or ninety feet in length, and about as many in height; on the outside there is an easy ascent for oxen, who turn the Persian wheels by which the water is raised to the top. The whole is supported by arches from ten to fifteen feet wide, of which Pococke counted 289, but Sonnini 350. Opposite to it is the mouth of the canal before mentioned. On an island in the middle of the river (Rhoda), is the celebrated Mikias Nilometer, or measurer of the Nile, the purpose of which is to ascertain the rising of the river during the annual inundation. It is composed of a noble marble pillar, surmounted by a Corinthian capital, which rises from the centre of a basin having a communication with the Nile, and, being graduated, indicates the increase in the height of that important stream. A splendid dome supported by columns, surmounts the pillar. This building is said to be 1000 years old.

CAIRO, a small town of Italy, in Piedmont, in tne Duchy of Montferrat, between Acqui and Finale, on the road to Savona. Here is a considerable carrying trade, and here was fought on 21st September, 1794, a bloody battle between the French and the Austro-Sardinians, in which the latter were defeated. In 1796 the town was taken by the French. It stands on the river Bormida; twelve miles E.N.E. of Ceva, eighteen south of Acqui, and twenth-five E.N.E. of Mondovi. Population 4000.

CAIRO is also the name of a post-township of the United States, in Greene County, New York.

CAISSON, in military affairs, a wooden frame or chest, made square, the side planks about two inches thick: it may be made to contain loaded shells. Caissons are buried under ground, at the depth of five or six feet, under some work the enemy intends to possess himself of; and when he becomes master of it, fire is put to the train, which inflames the shells and blows up the assailants. Sometimes a quantity of loose powder is put into the chest on which the shells are placed, sufficient to put them in motion, and raise them above ground; at the same time that the blast of powder sets fire to the fuze in the shells, which must be calculated to burn from 1 to 2½ seconds. Also a kind of flat-bottomed boat in which brick or stone work is built, then sunk to the bottom for forming the foundations. Some of the caissons which were used by Labelye, for the erection of Westminster-bridge, contained above 150 load of fir timber. They are also used in dock-yards to raise ships,—the water being let in so as to allow the caisson to be brought under the bottom of the vessel, it is then pumped out, and the buoyancy of the large caisson raises the vessel. The ship's sides and bottom tending to fall outwards, by their own weight, and the sides and bottom of the caisson tending to be forced inwards, by the external pressure of the water, it is obvious, that by placing props or shoars between, both will be supported, while the ship will ride with all her stores on board, and masts standing nearly as easy as when in water.

CAITAIA, in zoology, the name of an American monkey, remarkable for its smell, having somewhat of a scent of musk; its hair is long and of a whitish-yellow color; its head is round; its forehead depressed, and very small; its nose small and flatted, and its tail arched. It is easily tamed, but very clamorous and quarrelsome.

CAITHNESS, otherwise called the county of Wick, is the most northern county of Scotland. It is bounded on the east by the ocean, and by Strathnaver and Sutherland on the south and south-west; from these it is divided by the mountain Orde, and a continued ridge of hills as far as Knockfin, and thence by the whole course of the river Hallowdale. On the north it is washed by the Pentland frith, which divides it from the Orkneys. It extends thirty-five miles from north to south, and about twenty from east to west. The coast is rocky, and remarkable for a number of bays and promontories. Of these, the principal are Sandside-head, to the west, pointing to the opening of Pentland-frith; Orcas, now Holborn-head and Dunnet-Head, both pointing northward to the frith. Scribister-bay, on the north-west, is a good harbour, where ships may ride securely. Rice-bay, on the east side, extends three miles in breadth; but is of dangerous access, on account of some sunk rocks at the entrance. At the bottom of this bay appear the ruins of two strong castles. the seat of the earl of Caithness, called Castle Sinclair, and Gernego, joined to each other by a draw-bridge. Duncan's-bay, otherwise called Dunsby-head, is the north-east point of Caithness, and the most extreme promontory in Britain. At this place the breadth of the frith does not exceed twelve miles. It is the ordinary ferry to the Orkneys. Here is likewise Clythness pointing east and Noshead pointing north-east. The sea in this place is very impetuous, being in continual agitation from violent counter-tides, currents, and vortices. The only island belonging to this county is that of Stroma, in the Pentland frith, two miles from the main land. The county of Chithness, though chiefly mountainous, flattens towards the sea-coast, where the ground is arable, and produces good harvests of oats and barley, sufficient for the natives, and yielding a surplus for exportation. Caithness is well watered with small rivers, brooks, lakes, and fountains, and affords a few woods of birch, but is in general bare of trees; and even those the inhabitants plant are stunted in their growth. Lead is found at Dunnet, copper at Old Urk, and iron ore at several places; but these advantages are not improved. The air of Caithness is temperate, though in the latitude of 58°, where the longest day in summer lasts eighteen hours; and when the sun sets he makes so small an arch of a circle below the horizon, that the people enjoy twilight until he rises again. The fuel used by the inhabitants of Caithness consists of peat and turf, which the ground yields in great plenty. The forests of Moravins and Berridale afford abundance of red deer and roe-bucks: the country is well stored with hares, rabbits, growse, heathcocks, plover, and all sorts of game; besides a peculiar species of birds called snow-fleets; which are about the size of a sparrow, exceedingly delicious, and come hither in large flights about the middle of February, and depart in April. The hills are covered with sheep and black cattle, which are so numerous that a fat cow has been sold for 4s. sterling. The rocks along the coasts are frequented by eagles, hawks, and all kinds of sea-fowl, whose eggs and young are taken in vast quantities by the natives. The rivers and lakes abound with trout, salmon, and eels; and the sea affords a very advantageous fishery. Various obelisks and ancient monuments appear in this district, and several Romish chapels are still standing. Caithness is well peopled with a race of hardy inhabitants, who employ themselves chiefly in fishing and breeding sheep and black cattle, and are remarkably industrious. This county sends out in some years about 20,000 head of black cattle, but in bad seasons the farmers kill and salt vast numbers for sale. Great numbers of swine are also reared. They are short, high-backed, long-bristled, sharp, slender, and long-nosed; have long erect ears, and a most ferocious look. Vast

sel, formed of the shell of a gourd, emptied and dried, serving to put divers kinds of goods in, as pitch, resin, and the like. The Indians, both of the North and South Sea, put the pearls they have fished in calabashes, and the negroes on the coast of Africa do the same with their gold-dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans. The same vessels likewise serve to hold liquors, and answer as cups, and bottles, for soldiers and pilgrims.

CALABOZO, a town in the province of Venezuela, South America, founded in the early part of the last century by a commercial company of Guipuscoa. It is situated between the Guarico to the west, and the Orituco to the east; but nearer the former than the latter. The streets and houses have an agreeable aspect, and it has a neat church. The fine pasturage of the adjacent country rears numerous herds of cattle. The town is subject to occasional inundations from the mighty streams adjacent, and the climate is very hot, though tempered by the north-east breezes. There are five dependent villages or missions, containing altogether 98,000 head of cattle. The town itself has about 6000 inhabitants, and is 156 miles south of Caraccas.

CALABRIA, a country of Italy, in the kingdom of Naples, which was almost entirely desolated by the earthquakes of 1783. The reiterated shocks extended from Cape Spartivento to Amantea, above the gulf of St. Eufemia, and also affected that part of Sicily which lies opposite to the southern extremity of Italy. Those of the 5th and 7th of February and the 28th of March were the most violent, and completed the destruction of every building throughout the above-mentioned space. Not one stone was left upon another, south of the narrow isthmus of Squillace; and a very large proportion of the inhabitants were killed by the falling of their houses, near 40,000 lives being lost. Some were dug out alive, after remaining a surprising length of time buried among the rubbish. Messina became a mass of ruins; its beautiful palazzata was thrown in upon the town, and its quay cracked into ditches full of water; Reggio was almost destroyed; Tropea greatly damaged; and every other place in the province levelled to the ground. Before and during the concussion the clouds gathered, and then hung immovable and heavy over the earth. At Palmi the atmosphere had so fiery an aspect, that many people thought part of the town was burning. It was afterwards remembered, that an unusual heat had affected the skins of several persons just before the shock; the rivers assumed a muddy ash-colored tinge, and a sulphureous smell was almost general. A frigate passing between Calabria and Lipari felt so severe a shock, that the steersman was thrown from the helm, and the cannons were raised up to their carriages, while all around the sea exhaled a strong smell of brimstone. Stupendous alterations were occasioned in the face of the country; rivers choked up by the falling in of the hills, were converted into lakes, which if not speedily drained by some convulsion, or opened by human labor, would have stagnated and filled the air with pestilential vapors, and destroyed the remnants of population. Whole acres of ground, with houses and trees upon them, were broken off from the plains, and washed many furlongs down the deep hollows which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an upright or an inclining position. In short, every species of phenomenon, incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this ruined country. Their Sicilian majesties, with the utmost expedition, despatched vessels loaded with every thing that could be thought of on the occasion for the relief and accommodation of the distressed Calabrians; a general officer went from Naples with engineers and troops to direct the operations of the persons employed in clearing away and rebuilding the houses, and to defend the property of all the sufferers. The king ordered this officer to take all the money the royal treasures could supply or borrow; for, rather than it should be wanting on this pressing call, he was determined to part with his plate, nay, the very furniture of his palace. A messenger sent off from a town near Reggio on the 8th of February, travelled four days without shelter, and without being able to procure a morsel of bread. To add to all their other sufferings, the Calabrians found themselves and the miserable wreck of their fortunes exposed to the depredations of robbers and pirates; and to this accumulated distress succeeded a most inclement season, which obstructed every effort made to alleviate it; almost daily earthquakes kept the inhabitants in continual dread, not of being destroyed by the fall of houses, for none were left, but of being swallowed up by the splitting of the earth, or buried in the waves by some sudden inundation. See Earthquake. Calabria is divided into Ulterior and Citerior.

Calabria Citerior, or Citra, i. e. Hither Calabria, is one of the twelve provinces of Naples; and is bounded on the south by Calabria Ulterior, on the north by Basilicata, and on the west and east by the sea. Cosenza is the capital.

Calabria Ulterior, or Ultra, i. e. Farther Calabria, is washed by the Mediterranean Sea on the east, south, and west, and bounded by Calabria Citra on the north. Reggio is the capital.

CALACINE, or Callachene, in ancient geography, an extensive district of Assyria, north-east of the Tigris, and south of the Gordian mountains of Armenia.

CALADE, in the menage, the sloping declivity of a menage ground, upon which we ride down a horse several times, putting him to a short gallop, with his fore hams in the air, to learn him to ply or bend his haunches, and form his stop upon the aids of the calves of the legs, the stay of the bridle, and the caveson seasonably given.

LAGUALÆ Radix, in the materia medica,

the root so called is knotty, and somewhat like that of the polypody tribe. It has been exhibited internally at Rome, with success, in dropsy; and it is said to be efficacious in pleurisy, contusions, and abscesses.

CALAHORRA, an episcopal town of Spain, in Old Castile, seated on a fertile soil, on the side of a hill which extends to the banks of the river Ebro. It is sixty-miles north-west of Saragossa.

CALAIS, a sea-port town of France, the chief town of a district in the department of the Pas de Calais, the seat of a prefecture of police, and of a tribunal of commerce. It is situated on marshy ground, which, by means of sluices, may be overflowed at pleasure, and is nearly surrounded by a moat and a wall, which is used as a public promenade. Calais is defended by a citadel on the north-west side, near the sea, nearly as large as the town. Fort Nieulay, an oblong square, was built in 1680, is supported by piles, and connected with this citadel by a mole. The harbour is not large, and is much obstructed with sand, even common merchantmen can only come in at high water. It consists of a large quay, terminated by two long wooden piers. A century ago it is said to have been capable of admitting vessels of 300 or 400 tons, but it has now only three fathoms at high water. Proposals have repeatedly been made to improve and deepen the harbour; but these have not as yet been listened to, though the expense would probably not exceed 1,500,000 livres. The country around is well cultivated, particularly between Calais and Gravelines, and houses environed with wood, rich meadows, and corn-fields, everywhere appear. The town is a parallelogram, having its long side towards the sea. The streets are wide and regular, well paved, and tolerably clean; and the houses are well built. The public buildings worth notice are the arsenal, built by Cardinal Richelieu, the churches and monasteries, a tolerably good theatre, and the hotel at the Lion D' Argent, which in fact is itself a small town. The principal manufactures are stockings and soap; and it possesses a very considerable coasting trade. It is also the great mart for the salt and gin of Holland; and the fishing of cod, herrings, and mackerel, is carried on to a great extent. Two fairs are held annually here; one on the 10th January, which continues for ten days; and another on the 11th July, for nine days; the principal articles of traffic are cattle, jewellery goods, iron and copper ware. This trade is much facilitated by the canals which communicate with Gravelines, Ardres, St. Omer, Dunkirk, and several other places in the north of France. Regular packet-boats, in the time of peace, sail twice a week or oftener, with the mail between Calais and Dover. The inhabitants derive a considerable part of their support from the intercourse with England.

In the twelfth century, the town was nothing more than a village belonging to the counts of Boulogne, but was afterwards so well fortified, that Edward III. in 1346, after the battle of Cressy, could only reduce it by famine. It continued in the possession of England till 1558, when it was taken by surprise by the duke of Guise. By the subsequent treaty of Chateau-Cambresis, it was stipulated that the French should retain it for eight years, at the expiration of which, queen Elizabeth sent troops to demand it; but the surrender was evaded on the ground that the English had violated the treaty by the bombardment of Havre-de-Grace. In 1596 it was taken by assault by the Spaniards, but restored to France at the peace of Vervins. It was bombarded in 1694 by the English, under Sir Cloudesly Shovel, but without much damage. Louis XVIII. landed here from his long exile on the 24th of April, 1814: a monument is erected on the spot to commemorate the event. Near the town also is a monument on the spot where Blanchard descended. Calais was not the scene of a single execution, it is said, during the French revolution. It is twenty miles north-east of Boulogne, twenty-five south-west of Dunkirk, fifty-five north of Abbeville, 170 north of Paris, and seventeen and a half south-east of Dover. Population 8500.

Calais (St.), is a small town of France, in the department of the Sarthe. Population 3646.

Calais is also the name of a township of the United States, in Caledonia county, Vermont, 105 miles north-east of Bennington.

Calais, in fabulous history, the twin brother of Zethes. They were said to have been the sons of Boreas and Orythyia, and to have had wings. They went on the voyage to Colchis with the Argonauts, delivered Phineus from the harpies, and were slain by Hercules.

Calais, Straits of, a department of France, bounded on the east by the department of the North; on the south by that of the Somme; on the west by the British Channel, and on the north by the straits of Dover. It is formed partly out of the ci-devant province of Artois, and partly from that of Picardy. Calais, St. Omer, Bethune, Hesdin, Arras, and Bapaume are its chief towns.

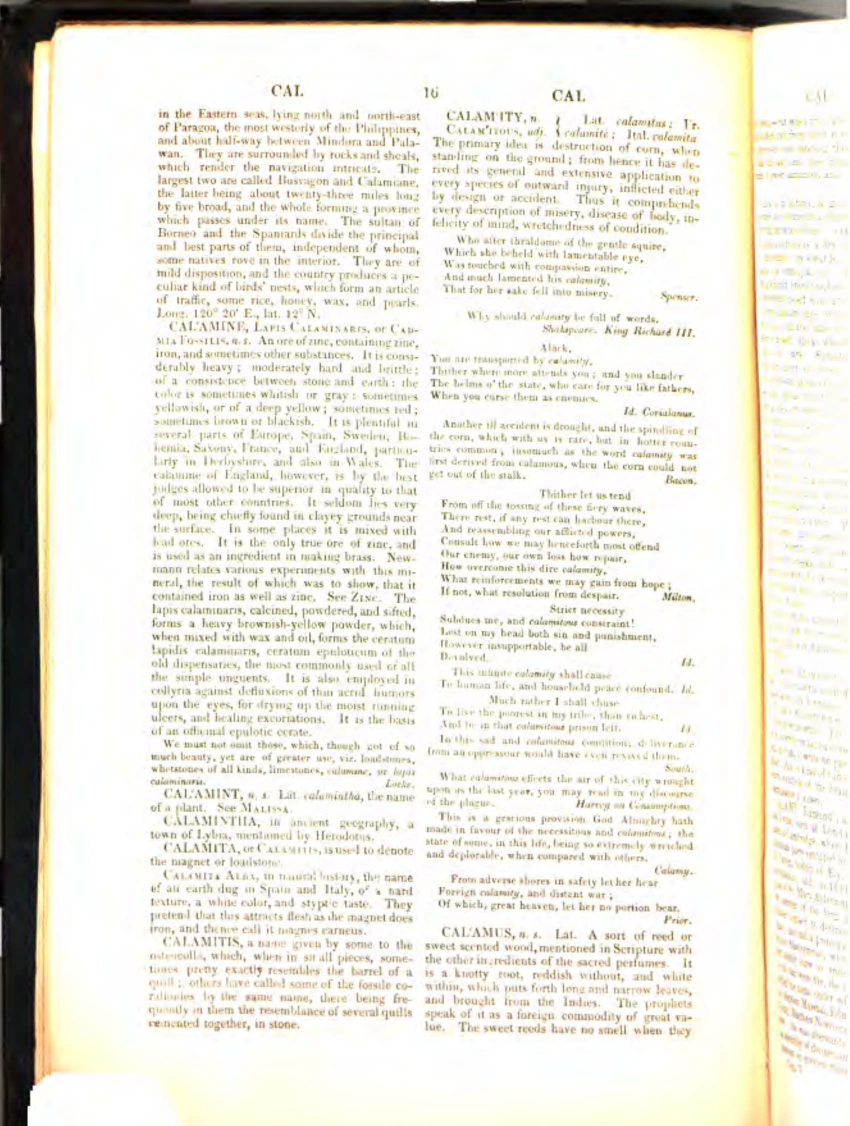
CALAMAN'CO. Lat. *caula monicha*, a sort of woollen stuff, so called from being used by monks. In the middle ages Dr. Johnson says it signified a hat. It is manufactured in England, Brabant, and Flanders, particularly at Lisle, Tournay, Antwerp, and a few other towns. It has a fine gloss; and is chequered in the warp, whence the cheques appear only on the right side. Some calamancoes are quite plain, others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

> He was of a bulk and stature larger than ordinary, had a red coat, flung open to shew a *calamanco* waistcoat.
> *Tatler.*

CALAMATA, or Calameta, a considerable town of European Turkey, in the Morea, and province of Belvedera. It was taken by the Venetians in 1685; but the Turks retook it with all the Morea. It stands on the river Spinarza, eight miles from the sea, on the site of the ancient Sparta.

CALAMBA, or Calambac, in commerce, a kind of wood brought from China, usually sold under the denomination of agallochum, or aloes-wood.

CALAMIANES, a group of twelve islands



in the Eastern seas, lying north and north-east of Paragoa, the most westerly of the Philippines, and about half-way between Mindora and Palawan. They are surrounded by rocks and shoals, which render the navigation intricate. The largest two are called Bussagon and Calamiane, the latter being about twenty-three miles long by five broad, and the whole forming a province which passes under its name. The sultan of Borneo and the Spaniards divide the principal and best parts of them, independent of whom, some natives rove in the interior. They are of mild disposition, and the country produces a peculiar kind of birds' nests, which form an article of traffic, some rice, honey, wax, and pearls. Long. 120° 20' E., lat. 12° N.

CAL'AMINE, Lapis Calaminaris, or Cadmia Fossilis, *n. s.* An ore of zinc, containing zinc, iron, and sometimes other substances. It is considerably heavy; moderately hard and brittle; of a consistence between stone and earth: the color is sometimes whitish or gray: sometimes yellowish, or of a deep yellow; sometimes red; sometimes brown or blackish. It is plentiful in several parts of Europe, Spain, Sweden, Bohemia, Saxony, France, and England, particularly in Derbyshire, and also in Wales. The calamine of England, however, is by the best judges allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds near the surface. In some places it is mixed with lead ores. It is the only true ore of zinc, and is used as an ingredient in making brass. Newmann relates various experiments with this mineral, the result of which was to show, that it contained iron as well as zinc. See Zinc. The lapis calaminaris, calcined, powdered, and sifted, forms a heavy brownish-yellow powder, which, when mixed with wax and oil, forms the ceratum lapidis calaminaris, ceratum epuloticum of the old dispensaries, the most commonly used of all the simple unguents. It is also employed in collyria against defluxions of thin acrid humors upon the eyes, for drying up the moist running ulcers, and healing excoriations. It is the basis of an officinal epulotic cerate.

We must not omit those, which, though not of so much beauty, yet are of greater use, viz. loadstones, whetstones of all kinds, limestones, *calamine, or lapis calaminaris.* *Locke.*

CAL'AMINT, *n. s.* Lat. *calamintha*, the name of a plant. See Malissa.

CALAMINTHA, in ancient geography, a town of Lybia, mentioned by Herodotus.

CALAMITA, or Calamitis, is used to denote the magnet or loadstone.

Calamita Alba, in natural history, the name of an earth dug in Spain and Italy, of a hard texture, a white color, and styptic taste. They pretend that this attracts flesh as the magnet does iron, and thence call it magnes carneus.

CALAMITIS, a name given by some to the osteocolla, which, when in small pieces, sometimes pretty exactly resembles the barrel of a quill; others have called some of the fossile coralloides by the same name, there being frequently in them the resemblance of several quills cemented together, in stone.

CALAM'ITY, *n.* } Lat. *calamitas*; Fr.
Calam'itous, *adj.* } *calamité*; Ital. *calamita*.
The primary idea is destruction of corn, when standing on the ground; from hence it has derived its general and extensive application to every species of outward injury, inflicted either by design or accident. Thus it comprehends every description of misery, disease of body, infelicity of mind, wretchedness of condition.

> Who after thraldome of the gentle squire,
> Which she beheld with lamentable eye,
> Was touched with compassion entire,
> And much lamented his *calamity*,
> That for her sake fell into misery. *Spenser.*
>
> Why should *calamity* be full of words.
> *Shakspeare. King Richard III.*
>
> Alack,
> You are transported by *calamity*.
> Thither where more attends you; and you slander
> The helms o' the state, who care for you like fathers,
> When you curse them as enemies.
> *Id. Coriolanus.*

Another ill accident is drought, and the spindling of the corn, which with us is rare, but in hotter countries common; insomuch as the word *calamity* was first derived from calamous, when the corn could not get out of the stalk. *Bacon.*

> Thither let us tend
> From off the tossing of these fiery waves,
> There rest, if any rest can harbour there,
> And reassembling our afflicted powers,
> Consult how we may henceforth most offend
> Our enemy, our own loss how repair,
> How overcome this dire *calamity*,
> What reinforcements we may gain from hope;
> If not, what resolution from despair. *Milton.*
>
> Strict necessity
> Subdues me, and *calamitous* constraint!
> Lest on my head both sin and punishment,
> However insupportable, be all
> Devolved. *Id.*
>
> This infinite *calamity* shall cause
> To human life, and household peace confound. *Id.*
>
> Much rather I shall chuse
> To live the poorest in my tribe, than richest,
> And be in that *calamitous* prison left. *Id.*

In this sad and *calamitous* condition, deliverance from an oppressour would have even revived them. *South.*

What *calamitous* effects the air of this city wrought upon us the last year, you may read in my discourse of the plague. *Harvey on Consumptions.*

This is a gracious provision God Almighty hath made in favour of the necessitous and *calamitous*; the state of some, in this life, being so extremely wretched and deplorable, when compared with others. *Calamy.*

> From adverse shores in safety let her hear
> Foreign *calamity*, and distant war;
> Of which, great heaven, let her no portion bear.
> *Prior.*

CAL'AMUS, *n. s.* Lat. A sort of reed or sweet scented wood, mentioned in Scripture with the other ingredients of the sacred perfumes. It is a knotty root, reddish without, and white within, which puts forth long and narrow leaves, and brought from the Indies. The prophets speak of it as a foreign commodity of great value. The sweet reeds have no smell when they are green,—but when they are dry only. Their form differs not from other reeds, and their smell is perceived upon entering the marshes.

Take thou also unto thee principal spices of pure myrrh, of sweet cinnamon, and of sweet *calamus*.
Exodus, xxx. 23.

Calamus, in botany, a genus of the monogynia order, and hexandria class of plants: natural order fifth, tripetaloideæ: cal. is hexaphyllous: cor. none, the fruit is a dry monospermous berry, imbricated backwards. There are nine species, the principal one is, C. rotang. The stem is without branches, has a crown at top, and is everywhere beset with straight spines. This is the true Indian cane, which is not visible on the outside; but the bark being taken off discovers the smooth stick, which has no marks of spine on the bark. Sumatra is said to be the place where most of these sticks grow. Such are to be chosen as are of proper growth between two joints, suitable to the fashionable length of canes as they are worn; but such are scarce. The calamus rotang is one of the plants from which the drug called dragon's blood is obtained. The petrocarpus draco and dracæna draco, also afford this resin. It is generally much adulterated, and varies in goodness and purity. The best kind is of a dark red color, which, when powdered, changes to crimson: it is soluble in alcohol, but not in water. It readily melts and catches flame: has no smell, but discovers some degree of warmth and pungency to the taste. The ancient Greeks were acquainted with the astringent power of this drug, in which character it was formerly much employed in hæmorrhages and alvine fluxes.

Calamus, in the ancient poets, denotes a simple kind of pipe, the musical instrument of the shepherds, usually made either of an oaten stalk or a reed.

Calamus, Aromaticus, or sweet-scented flag, in the materia medica, a species of flag called acorus by Linnæus.

Calamus Scriptorius, in antiquity, a reed or rush to write with. The ancients made use of styles to write on tables covered with wax, and of reed, or rush, to write on parchment, or Egyptian paper. Also, a kind of canal at the bottom of the fourth ventricle of the brain, so called from its resemblance to a pen.

CALAMY (Edmund), an eminent presbyterian divine, born at London in 1600, and educated at Cambridge, where his attachment to the Arminian party excluded him from a fellowship. Dr. Felton, bishop of Ely, however, made him his chaplain; and, in 1639, he was chosen minister of St. Mary Aldermary, in London. Upon the opening of the long parliament, he distinguished himself in defence of the Presbyterian cause; and had a principal hand in writing the famous Smectymnus, which he says, gave the first deadly blow to episcopacy. The authors of this tract were five, the initials of those names formed the name under which it was published, viz. Stephen Marshal, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurstow. He was afterwards an active member in the assembly of divines, and used his utmost endeavours to prevent those violences committed after the king was brought from the Isle of Wight. In Cromwell's time he lived privately, but was assiduous in promoting the king's return; for which he was afterwards offered a bishopric, but refused it. He was ejected for nonconformity in 1662; and died of grief at the sight of the great fire of London in 1666.

Calamy (Edmund), grandson of the preceding, by his eldest son Mr. Edmund Calamy, who was ejected out of the living of Moxton in Essex on St. Bartholomew's day, 1662. He was born in London, April 5th, 1671. After having learned the languages, and gone through a course of natural philosophy and logic, at a private academy in England, he studied philosophy and civil law, at the university of Utrecht, and attended the lectures of the learned Grævius. While he resided there, an offer of a professor's chair in the university of Edinburgh was made him by principal Carstairs, sent over on purpose to find a person properly qualified for the office. This he declined, and returned to England in 1691, bringing with him letters from Grævius to professors Pocock and Bernard, who obtained leave for him to prosecute his studies in the Bodleian library. He entered into an examination of the controversy between the conformists and the nonconformists; which determined him to join the latter; and coming to London, in 1692, he was chosen assistant to Mr. Matthew Sylvester, at Blackfriars; and in 1674 ordained at Mr. Annesly's meeting-house. In 1702 he was chosen one of the lecturers in Salter's-hall; and in 1703 succeeded Mr. Vincent Alsop in Westminster. He drew up the table of contents to Mr. Baxter's History of his Life and Times, which was sent to the press in 1696; and added to it an Index. He next composed an abridgment of it, with an Account of many other Ministers who were ejected after the Restoration; Their Apology containing the grounds of their nonconformity; and a Continuation of their History till 1691. This work was published in 1702. He afterward published a Defence of Nonconformity, in tracts in answer to Dr. Hoadley. In 1709 he made a tour to Scotland; and had the degree of D. D. conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713 he published a second edition of his Abridgement of Baxter's History, in which, among other additions, there is a continuation of the history through King William's reign, and Queen Anne's, down to the passing of the Occasional Bill; and in the close is subjoined the reformed liturgy, which was drawn up and presented to the bishops in 1661. In 1718 he wrote a Vindication of his grandfather and others, against certain reflections cast upon them by Mr. Echard in his History of England; and in 1728 appeared the Continuation of the Account of the Ministers, Lecturers, Masters, Fellows of Colleges, and Schoolmasters, who were ejected after the Restoration. He died June 3rd, 1732, greatly regretted both by the dissenters and members of the established church, with many of whom he lived in great intimacy. Besides the pieces already mentioned, he published many sermons. He was twice married and had thirteen children.

CALANDRE, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarabæus or beetle class; it has two antennæ formed of many round joints, and covered with a soft and short down; from the anterior part of the head there is thrust out a trunk, which is so formed at the end, that the creature easily makes way with it through the coat or skin that covers the grain, and gets at the meal or farina on which it feeds; the inside of the grain is also the place where the females deposit their eggs, that the young progeny may be born with provision about them. When the the female has pierced a grain of corn for this purpose, she deposites in it one egg, or at the utmost two, but she most frequently lays them single; these eggs hatch into small worms, which are usually found with their bodies rolled up in a spiral form, and after eating till they arrive at their full growth, they are changed into chrysales, and from these, in about a fortnight, comes out the perfect calandre. The female lays a considerable number of eggs; and the increase of these creatures would be very great; but while in the egg state, and even while in that of the worm, they are subject to be eaten by mites; these little vermin are always very plentiful in granaries, and they destroy the far greater number of the larger animals.

CALAPIA, in entomology, an American species of cancer, having a crenulated thorax, with the posterior angles dilated, hand-claws crested.

CALAS (John), an unfortunate protestant merchant at Toulouse, inhumanly butchered under form of law, to gratify the sanguinary impulse of ignorant Popish zeal. He had lived forty years at Toulouse. His wife was an Englishwoman of French extraction, and they had five sons; one of whom, Lewis, had turned Catholic, through the persuasion of a Catholic maid who had lived thirty years in the family. In October, 1761, the family consisted of Calas, his wife, Mark Antony their son, Peter their second son, and this maid. Anthony was educated for the bar, but, being of melancholy turn, was continually dwelling on passages from authors on the subject of suicide, and one night in that month hanged himself on a bar laid across two folding doors in their shop. The crowd collected by the confusion of the family on so shocking a discovery, took it into their heads, that he had been strangled by the family to prevent his changing his religion, and that this was a common practice among Protestants. The officers of justice adopted the popular tale, and were supplied by the mob with what they accepted as evidences of the fact. The fraternity of White Penitents got the body, buried it with great ceremony, and performed a solemn service for him as a martyr; the Franciscans did the same: and after these formalities no one doubted the guilt of the devoted heretical family. They were all condemned to the torture, to bring them to confession; they appealed to the parliament; who, as weak and wicked as the subordinate magistrates, sentenced the father to the torture, ordinary and extraordinary, to be broken alive upon the wheel, and then to be burned to ashes; which decree, to the disgrace of humanity, was actually carried into execution. Peter Calas, the other son, was banished for life; and the rest were acquitted. The distracted widow found some friends, and among the rest M. Voltaire, who laid her case before the council of state at Versailles, and the parliament at Toulouse were ordered to transmit the proceedings. These the king and council unanimously agreed to annul; the capitoul, or chief magistrate of Toulouse, was degraded and fined; old Calas was declared to have been innocent; and every imputation of guilt was removed from the family, who also received from the king and clergy considerable gratuities.

CA'LASH, *n. s.* From Fr. *caleche*. It is a light kind of carriage, with very low wheels, open on all sides for the conveniency of the air and prospect, or at most enclosed with light mantles of cloth to be opened and shut at pleasure.

> Daniel, a sprightly swain, that used to slash
> The vigorous steeds that drew his lord's *calash*. *King*.

> The ancients used *calashes*, the figures of several of them being to be seen on ancient monuments. They are very simple, light, and drove by the traveller himself. *Arbuthnot on Coins*.

CALASIO (Marius), a Franciscan professor of Hebrew at Rome. He published there, in 1621, a concordance of the Bible, which consisted of 4 vols. folio. This valuable work, is in fact a complete lexicon of the Hebrew, with its various dependent dialects; for besides the Hebrew words in the Bible, which are in the body of the book with the Latin version over against them, there are in the margin the differences between the septuagint version and the vulgate; so that at one view may be seen wherein the three texts agree, and wherein they differ. Moreover at the beginning of every article there is a kind of dictionary, which gives the signification of each Hebrew word; and affords an opportunity of comparing it with the Syriac, Arabic, and Chaldee. A valuable edition of this work was published in London, 1747, edited by the Rev. W. Romaine, assisted by Rowe Mores, and Lutzena a Portuguese Jew.

CALASIRIS or CALASSIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment: which last they pulled off when they entered the temples, being only allowed to appear there in linen.

CALATHUS, in antiquity, a kind of hand basket made of light wood or rushes; used by the women to gather flowers, but chiefly to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. The Calathus or work basket of Minerva is no less celebrated among the poets than her distaff. It was also the name of a cup for wine used in sacrifices.

CALATOR, from καλαω, to call, in antiquity, a crier, appointed to publish any thing aloud, or call the people together.

CALATRAVA, a city of Spain in New Castile on the river Guadiana, forty-five miles south of Toledo.

CALATRAVA, KNIGHTS OF, a military order in Spain instituted under Sancho III. king of Cas-

into execution. Peter Calas, the other son, w
banished for life; and the rest were acquitted.
The distracted widow found some friends, and
among the rest M. Voltaire, who laid her case
before the council of state at Versailles, and the
parliament at Toulouse were ordered to trans-
nit the proceedings. These the king and coun-
il unanimously agreed to annul; the capitoul,
r chief magistrate of Toulouse, was degraded
nd fined; old Calas was declared to have been
nocent; and every imputation of guilt was re-
oved from the family, who also received from
e king and clergy considerable gratuities.

AVA, a city of Spain in New Cas-
ver Guadiana, forty-five miles south

A, KNIGHTS of, a military order in
ted under Sancho III. king of Cas-

tile, upon the following occasion:—When that prince took the strong fort of Calatrava from the Moors of Andalusia, he gave it to the templars, who, not being able to defend it, returned it him again. Don Raymond, of the order of Cistercians, accompanied with several persons of quality, then made an offer to defend the place, which the king thereupon delivered to them, and instituted that order. It increased so much under the reign of Alphonsus, that the knights desired to have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of pope Innocent VIII. re-united the grandmastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof. Their rules and habits were at first those of the Cistercians, but their present habit is a mantle of white silk, tied with a cordon and tassels, and on the left arm the cross of the order is embroidered. Their cross is a cross fleury *gules* as in the annexed figure, and is worn at the stomach, pendants to a red ribbon. It is styled the gallant order of Calatrava.

CALAURIA, in ancient geography, an island of Greece in the Saronic bay, over against the port of Troezen, at the distance of forty stadia. Hither Demosthenes went twice into banishment; and here he died. Neptune was said to have accepted this island from Apollo in exchange for Delos. The city of this name stood on a high ridge nearly in the middle of the island, commanding an extensive view of the gulph and its coasts. Here was the temple of Neptune; the priestess of which was a virgin, who was dismissed when marriageable. The Macedonians, when they had reduced Greece, were afraid to violate the sanctuary, by forcing from it the fugitives, his suppliants. Antipater commanded his general to bring away the orators, who had offended him, alive; but Demosthenes could not be prevailed on to surrender. His monument remained in the second century, within the enclosure of the temple. The city of Calauria has been long abandoned. Traces of buildings, and of ancient walls, appear nearly level with the ground; and some stones, in their places, each with a seat and back, forming a little circle, once perhaps a bath. The temple, which was of the Doric order, and not large, as may be inferred from the fragments, is reduced to an inconsiderable heap of ruins. The island is now called Poro.

C. ALBUM, in entomology, an European species of curculio, particularly distinguished by having an incurvated line on the wing-cases at the base, also the specific name of the common butterfly, a well known species of the European papiliones. This insect has angulated wings of a fulvous color, spotted with black: the posterior wings marked beneath with a white curved line resembling the letter C, whence its name.

CALCANEUM, calx, the heel, calcar pterna, os calcis. The largest bone of the tarsus, which forms the heel. See ANATOMY.

CALCANTHUM, red vitriol. See VITRIOL.

CALCAR, in glass-making, a small oven, or reverberatory furnace, in which the first calcination of sand and salt of potashes is made for the turning them into what is called frit. This furnace is made in the fashion of an oven ten feet long, seven broad in the widest part, and two deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it at the mouth by bricks nine inches wide. Into this trench they put sea coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the surface of which the smoke flies, and goes out at the mouth of the calcar; the coals burn on iron grates, and the ashes fall through.

CALCAR (John de), a celebrated painter, was the disciple of Titian, and perfected himself by studying Raphael. Among other pieces he drew a nativity, representing the angels around the infant Jesus; and so ordered the disposition of his picture, that the light all proceeds from the child. He died at Naples, in 1546, in the flower of his age. He designed the anatomical figures of Vesalius, the portraits of the painters of Vasari.

CALCAR, in conchology, a species of Turbo, of which Chemnitz gives several distinct varieties from India, the South Seas, and the Mediterranean. Also a species of nautilus, found in the Adriatic, and described by Plancus among his miscroscopic shells.

CALCAR, in entomology, a small German species of curculio, of a black color, with single toothed thighs and testaceous antennæ and feet.

CALCARATA, in entomology, a small species of buprestis, with bidentated striated wing-cases, shanks of the middle legs toothed: body copper-colored: found on German trees.

CALCARATUS, a species of cerambyx, color violaceous-black, thighs rufous, the posterior ones dentated. Also a species of cimex, color fuscous, abdomen sanguineous above, the posterior thighs six-toothed. Both these inhabit Europe.

CALCAREOUS, in mineralogy, the third order of the class earths, according to Gmelin's system, consisting principally of carbonate of lime.

CALCAREOUS SPAR, crystallised carbonate of lime. It occurs crystallised in more than 600 different forms, all having for their primitive form an obtuse rhomboid. It occurs also in massive and imitative shapes.

The colors of calc-spar are gray, yellow, red and green, lustre vitreous: fracture foliated, with a threefold cleavage, translucent. It is less hard than fluor spar, and is easily broken; specific gravity, 2·7, 43·6, carbonic acid, and 56·4 lime. It effervesces powerfully with acids, and some varieties are phosphorescent on hot coals. It is found in veins in all rocks, from granite to alluvial strata. The rarest and most beautiful crystals are found in Derbyshire.

CALCA'RIOUS. Lat. *calx, calcis;* lime; *lapis coctus*, from χαλιξ, denoting a stone or fragments of stones, from which cement or mortar is made.—*Vossius.* Scheidius on the other hand, by mutations of κλαω, *frango*, obtains κλαξ, whence καλξ.

On the east side, in the most broken part of the

precipices, is a stratum of bones of all sizes, belonging to various animals and fowls, enchased in an incrustation of a reddish *calcareous* rock. *Swinburne.*

CALCEARIUM, in antiquity, a largess bestowed on Roman soldiers for buying shoes. In monasteries, calcearium denoted the daily service of cleaning the shoes of the religious.

CALCEATED, *adj.* Lat. *calceatus*; shod; fitted with shoes.

CALCEDON. See CHALCEDON.

CALCEDONIANS, a denomination given by Coptic writers to the Melchites, on account of their adherence to the council of Calcedon.

CALCEDONIUS, *n. s.* Lat. the calcedony. A kind of precious stone. See CHALCEDONY.

Calcedonius is of the agate kind, and of a misty grey, clouded with blue, or with purple.

Woodward on Fossils.

CALCEOLARIA, from calceolus, a slipper, Slipper-wort; a genus of plants, class, diandria; order, monogynia: CAL. one-leaved perianth: COR. monopetalous: STAM. two filaments, incumbent anthers: PIST. a roundish germ: with very short style; and blunt stigma: PER. capsule subconic; seeds numerous. Nine species; almost all natives of Peru; generally with yellow clustering flowers, some of which are beautiful and well worth cultivating.

CALCHAS, in fabulous history, a famous diviner, who followed the Greek army to Troy. He foretold that the siege would last ten years; and that the fleet, which was detained in the port of Aulis by contrary winds, would not sail till Agamemnon's daughter had been sacrificed to Diana. He had received the power of divination from Apollo. Calchas was informed, that as soon as he found a man more skilled than himself in divination, he must perish; and this happened near Colophon, after the Trojan war. He was unable to tell how many figs were in the branches of a certain fig-tree; and when Mopsus mentioned the exact number, Calchas died through grief.

CALCHOPHONOS LAPIS, among the ancients, a name given to a stone of a black color, and considerable hardness, which, when cut into thin plates, and struck against by any other hard body, gave a sound like that of brass: it seems to have been one of the hard black marbles.

CALCIFRAGUS, stone-breaking, an appellation given by some to the scolopendrium, by others to pimpernel, on account of their lithrontriptic quality.

CALCIMURITE, in mineralogy, a species of earth, or stone, of the consistency of clay, found near Thonville. Its color is blue or olive green, and it contains magnesia, mixed with a considerable portion of calcareous earth, and some iron. The olive green colored, contains no argil. The blue is used by potters.

CALCINATION. The fixed residences of such matters as have undergone combustion, says Dr. Ure, are called cinders in common language, and calces, or now more commonly oxides, by chemists; and the operation, when considered with regard to these residues, is termed *calcination*. In this general way it has likewise been applied to bodies, not really combustible, but only deprived of some of their principles by heat. Thus we hear of the calcination of chalk, to convert it into lime, by driving off its carbonic acid and water; of gypsum or plaster stone, of alum, of borax, and other saline bodies, by which they are deprived of their water of crystallisation; of bones, which lose their volatile parts by this treatment; and of various other bodies. See CHEMISTRY. For the ancient definition, see the next article.

CALCINE', *v.*
CALX', *n.*
CAL'CINATE, *v.*
CALCINA'TION,
CAL'CINABLE.

See CALCARIOUS. To reduce to a calx. Calcination is thus described by Junius, as quoted by Dr. Johnson:—Such a management of bodies by fire as renders them reducible to powder; wherefore it is called chemical pulverisation. This is the next degree of the power of fire beyond that of fusion; for when fusion is longer continued, not only the more subtile particles of the body itself fly off, but the particles of fire likewise insinuate themselves in such multitudes, and are so blended through its whole substance, that the fluidity, first caused by the fire, can no longer subsist. From this union arises a third kind of body, which, being very porous and brittle, is easily reduced to powder; for, the fire having penetrated everywhere into the pores of the body, the particles are both hindered from mutual contact, and divided into minute atoms.

Our lampes brenning bothe night and day,
To bring about our craft, if that we may;
Our furneis eke of *calcination*,
And of waters albification.
Unslekked lime and gleire of an ey.

Chaucer's Canterbury Tales.

Gold, that is more dense than lead, resists peremptorily all the dividing power of fire; and will not be reduced into a *calx*, or lime, by such operations as reduce lead into it. *Digby.*

Divers residences of bodies are thrown away, as soon as the distillation or *calcination* of the body that yieldeth them is ended. *Boyle.*

This may be effected, but not without *calcination*, or reducing it by art into a subtile powder.

Browne's Vulgar Errours.

Fiery disputes that union have *calcined*,
Almost as many minds as men we find. *Denham.*

This chrystal is a pellucid fissile stone, clear as water, and without colour, enduring a red heat, without losing its transparency, and, in a very strong heat, *calcining* with fusion. *Newton's Opticks.*

The solids seem to be earth, bound together with some oil; for if a bone be *calcined*, so as the least force will crumble it, being immersed in oil, it will grow firm again. *Arbuthnot on Aliments.*

In hardening, by baking without melting, the heat hath three degrees; first, it indurateth, then maketh fragile, and lastly it doth *calcinate*.

Bacon's Nat. Hist.

'The earth that drinketh in the rain that cometh oft upon it,' is but a faint emblem of a *calcined* mind.

Expos. N. T. Heb. vi.

CALCIS LIQUOR, solution of lime formerly called aqua calcis. Take one pound of lime, and boiling water, three gallons; pour the water on the lime, let it stand for some time, and then pour it into stopped glass bottles together with the lime that remains. It is exhibited internally in cardialgia, spasms, diarrhœa, in doses of two and three ounces, &c.; and in proportionate doses in convulsions of children arising from acidity or

Nother his collect ne his expans yeres,
Nother his rote, ne his other geres,
As ben his centris, and his argumentes,
For his equations in every thing;
And by his eighte speres in his werking,
He knew ful wel how fer Alnath was shove
Fro the hed of thilke fix Aries above,
That in the ninthe spere considered is;
Ful sotilly he calculed all this.

Chaucer. Frankeleines Tale.

The general calculation, which was made after the last perambulation, exceeded eight millions.

Howel's Vocal Forest.

Cypher, that great friend to calculation, or rather which changeth computation into easy computation.

Holder on Time.

But if you would consider the true cause
Why all these fires, why all these gliding ghosts,
Why birds and beasts, from quality and kind,
Why old men, fools, and children calculate;
Why all these things change, from their ordinance,
Their natures and preformed faculties,
To monstrous quality; why you shall find,
That heaven hath infused them with these spirits,
To make them instruments of fear and warning,
Unto some monstrous state.

Shakespeare.

If they then [illegible] calculate, yet so they do not.

Hooker.

Being different from calculations of the ancients, their observations confirm not ours.

Brown's Vulgar Errours.

The whole body of the clergy and their families, make near 100,000 souls, that is about an eightieth part of the nation. And reckoning the population of England and Wales at eight millions of people, every clergyman would have a congregation of four hundred and forty-four persons to attend on, in the same way of instruction.

Simpson's Plea for Religion.

CALCULOSE, *adj.* } From Lat. *calculus.*
CALCULOUS. } Stony; gritty.

The calculous salt of some well regulated spirit[illegible] stones, and thus, perhaps, the stones, or concretions in the kidney or bladder, may be generated.

Brown's Vulgar Errours.

I have found, by opening the kidneys of a calculous person, that the stone is formed sooner than I have suspected.

Sharp.

CALCULUS, in antiquity, a little stone, or pebble, was used in making computations, in [illegible] suffrages, playing at tables, and the like. In after times, pieces of ivory, and counters of silver, gold, &c. were used in lieu of pebbles, still retaining the old name. The Roman judges ordinarily gave their opinions by calculi, which were white for absolution and black for condemnation. Hence calculus albus, in our old writers, denotes a favourable vote, or sentence, or a person to be absolved and acquitted; a [illegible] to some day of great good fortune; [illegible] the contrary. This custom is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unfortunate by black, pebbles put every night into an urn. Besides the difference of color, there were some calculi also which had characters engraven on them, as those which were in use in taking the suffrages in assemblies and at assemblies of the people. These calculi were made of thin wood, polished, and covered over with wax. Their form is still seen in some medals of the Cassian family; and the manner of casting them into the urns, in the medals of the Licinian family. These calculi were marked with the letters A for absolvo, i. e. I acquit; C for condemno, I condemn; N L, non liquet, i. e. it is not clear, must be further examined and additional information given. Calculi lusorii were the chess-men, or little balls, which were employed in the game of chess, which the poets allude to, both as to their matter, their color, and their use. They were made either of ivory, of old, silver, or glass.

Calculus, in chemistry, this word, physiologically and medically applied, designates those concretions of a morbid kind which are found in the viscera and cavities of animal bodies, as the kidneys and urinary bladder, the liver, gall-bladder, and ducts; and occasionally in the intestinal canal; to these last, however, the term concretion, rather than calculus, is more usually applied, and under that word we shall notice them, confining our account in the present article to urinary and biliary calculi.

Of urinary calculi.—These are found at different times in the kidneys, the ureters, the urinary bladder, the urethra, and the prostate gland. They are for the most part made up of those materials, disproportionately combined, which always exist in other proportions in the urine itself. To this law, however, there are occasional exceptions. One of the principal ingredients in urine, as will be seen by turning to the articles Chemistry and Urine, is uric acid, and accordingly we find the largest proportion of the concretions now to be noticed to contain uric acid as a master principle; indeed Majendie, who has published a small treatise especially on the subject of urinary calculi, seems to think that, neither in a pathological nor practical point of view, is it of much importance to take cognizance of any other; in this opinion he is however manifestly erroneous; for although the uric acid calculus is, as above intimated, of by far the most frequent occurrence, we very often meet with others which are exceedingly different in chemical composition, and for the counteraction of which a different medicinal process is demanded. See Medicine. It ought always to be recollected that there are very few instances in which the substances that give the character to calculi are found singly. When we talk of uric acid calculus, and especially of the other concretions, we mean merely that the name by which they are designated expresses the predominance of the principle.

Urinary calculi may be classed under the several following heads.

1. Uric or lithic acid calculi, which are formed mainly of uric acid.
2. Urate of ammonia calculi.
3. Ammoniaco-magnesian phosphate, or, as they are called, triple calculi.
4. Calculi of phosphate of lime.
5. Calculi of oxalate of lime (mulberry calculusi).
6. Calculi of the carbonate of lime.
7. Calculi of cystic oxide.

Uric acid calculus.—This, as above stated, is much more frequent in its occurrence than any other. Some have averaged their number at about half of the whole number of concretions that are found. Calculi of this kind are of various sizes, from that of a common nut to that of a large egg. They more resemble the common hard compact stones that are found in the roads, than do the other calculi; their shape is for the most part oval; they have an internal central nucleus from which rays proceed. Their color is for the most part of a yellowish brown or fawn.

When treated with the blow-pipe this calculus blackens and gives out an ammoniacal odor. It is soluble in pure alkalies.

The red sand so commonly voided in gravelly complaints consists almost entirely of uric acid.

The urate of ammonia calculus is in its pure state by no means common, but this composition is often found in cases where the uric acid is in excess, and in this way a mixed calculus is formed. This calculus is of a clayish color, and it is more earthy in its fracture than the uric acid concretion; it is also much more soluble in water, and a distinguishing property of it, from the mere uric acid calculus, is its solubility in the alkaline sub-carbonates, while the latter requires the alkali to be pure to dissolve it.

The ammoniaco-magnesian phosphate is scarcely ever found unmixed; its most usual combination is with the species next to be described, viz. the phosphate of lime, and the union constitutes the *fusible calculus* of Wollaston, so named because it is susceptible of being melted or fused into a vitreous matter by the blow-pipe.

The ammoniaco-magnesian phosphate is white, or of a pale gray; its texture is much softer than that of the uric acid calculus. This species frequently attains a very large size. When voided in the form of gravel it is white.

This calculus is soluble in acids, and not in pure alkalies.

The phosphate of lime calculus is of a pale brown or gray color, and smooth on its external surface. It is made up of laminæ that are easily separated. This, like the triple calculus, is easily soluble in the mineral acids, especially the muriatic. It requires an intense and long continued heat from the blow-pipe to fuse it. The calculi that are found in the prostate gland are of this species.

Oxalate of lime, or mulberry calculus, is much darker in its color than the other varieties. Its external surface is marked by projecting tubercles giving with its color something of a mulberry appearance. Sometimes it is smooth and paler externally; in this case it is also in smaller masses, and has been compared to a hemp-seed. This kind of calculus (the mulberry) is exceedingly hard.

Muriatic and nitric acids, if concentrated and heated, dissolve this species of calculus; but it is necessary for easy solution that the concretion be first powdered. Pure alkalies do not act upon it, but the alkaline carbonates, when digested with it, separate the oxalic acid from it which is replaced by the carbonic acid.

The carbonate of lime calculus is exceedingly rare Mr. Brande tells us that among several

r. Brande tells us that among several

---

hundred calculi from the human bladder, which he examined, he never met with a single instance of it.

Cystic oxide calculus is so named from its being composed of a peculiar animal substance which has the chemical habitudes of an oxide, and from Dr. Wollaston, the discoverer of it, having at first supposed it to be confined to the bladder: this calculus more nearly resembles the ammoniaco-magnesian phosphate in its external appearance than any other, but it is more compact and less laminated.

This calculus is soluble both in acids and alkalies. The acetic, tartaric, and citric acids do not however act upon it freely, neither does alcohol, nor water, nor the carbonate of ammonia.

A xanthic oxide calculus, and a *fibrinous calculus*, have been described by Dr. Marcet as differing from every other known species. The first is of a reddish color, not so readily soluble in acids as in alkalies; its solution in nitric acid when evaporated giving a yellow color (whence the name); it is considerably more soluble in water than uric acid calculus, and less easily soluble in acids than the cystic oxide. The other calculus seemed similar in its properties to fibrine, and hence Dr. Marcet proposed that, in the event of other instances of the same kind being found, the name fibrinous should be given to it

The following is an outline of the classification proposed by Fourcroy and Vauquelen after the analysis of more than 600 of these concretions. We copy the table from the last edition of Dr. Henry's Elements of Chemistry.

Genus I.—*Calculi composed chiefly of one ingredient.*

Species 1. Calculus of uric acid.
2. Calculus of urate of ammmonia.
3. Calculus of carbonate of lime.
4. Calculus of oxalate of lime.

Genus II.—*Calculi composed of two ingredients.*

Species 1. Calculus of uric acid and earthy phosphates in distinct layers.
2. Calculus of uric acid and earthy phosphates intimately mixed.
3. Calculus of urate of ammonia and the phosphates in layers.
4. Calculus of the same ingredients intimately mixed.
5. Calculus of earthy phosphates mixed, or else in fine layers.
6. Calculus of oxalate of lime and uric acid in distinct layers.
7. Calculus of oxalate of lime and earthy phosphates in layers.

Genus III.—*Calculi composed of three or four ingredients.*

Species 1, Calculus of uric acid or urate of ammonia, earthy phosphates, and oxalate of lime.
2. Calculus of uric acid, urate of ammonia, earthy phosphates and silex.

The urinary concretions found in the bladders of inferior animals contain no uric acid; they consist mainly of carbonate and phosphate of lime cemented by animal matter.

For an account of the symptoms which gravelly concretions produce, and for the dietetic and medicinal management of gravel and stone, see the articles Medicine and Surgery.

Calculi, Biliary, called gall-stones. Fourcroy described one species of these as consisting chiefly of adipocire; but Chevreul has given the name of *cholesterine* to the crystalline matter of biliary concretions, because it does not, like true adipocire, produce a soap with alkalies.

Cholesterine is described as a peculiar animal principle, insoluble in water, and nearly so in cold alcohol: but soluble in nitric acid. It is fusible at 280°, and if rapidly heated to about 400 it evaporates in dense smoke.

Some biliary calculi appear to be mere inspissations of bile, being soluble however in alcohol and water; and these inspissations are often found mixed in various degrees and proportions with the cholesterenic species, thus constituting concretions of intermediate characters.

The biliary calculi of the ox seem to consist almost entirely of the yellow matter of bile in a concrete state; this is used as a pigment. For further information on biliary concretions, see the article Medicine.

Calculus Differentialis is a method of differencing quantities, or of finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity; or, it is the arithmetic of the infinitely small differences of variable quantities. The foundation of this calculus is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal. Thus, in astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term, infinitesimal, therefore, is merely relative, and involves a relation to another quantity; and does not denote any real ens, or being. Now infinitesimals are called differentials, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them moments; considering them as the momentary increments of quantities, e. g. of a line generated by the flux of a point, or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lay claim to the discovery. There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals; the one as moments, the other as differences. Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter d: thus the differential of x is called dx; and that of y, dy; now dx is a

positive quantity, if x continually increase; negative, if it decrease. The English, with Sir Isaac Newton, instead of dx write $\dot{x}$ (with a dot over it); for dy, $\dot{y}$, &c. which foreigners object against, on account of that confusion of points which they imagine arises when differentials are again differenced; besides that the printers are more apt to overlook a point than a letter. The rules for differencing quantities are the very same as those for finding their fluxions. See FLUXIONS.

CALCULUS EXPONENTIALIS is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions. By exponential quantity, is here understood a power, whose exponent is variable; e. g. x^x. a^x. x^y. where the exponent x does not denote the same in all the points of a curve, but in some stands for two, in others for three, in others for five, &c. To difference an exponential quantity is the same problem as to find its fluxion. See FLUXIONS.

CALCULUS INTEGRALIS, or SUMMATORIUS, is a method of integrating, or summing up moments, or differential quantities; i. e. from a differential quantity given, to find the quantity from whose differencing the differential results. The integral calculus, therefore, is the inverse of the differential one: and is similar to the inverse method of fluxions, the rules of which also apply to the calculus integralis. See FLUXIONS.

CALCULUS LITERALIS, or LITERAL CALCULUS, is the same with specious arithmetic, or algebra, so called from its using the letters of the alphabet; in contradistinction to numeral arithmetic, which uses figures. See ALGEBRA.

CALCULUS MINERVÆ, among the ancient lawyers, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Æschylus and Euripides; at whose trial, before the Areopagites, for the murder of his mother, the votes being divided for and against him, Minerva interposed, and gave the casting calculus or vote, on his behalf.

CALCULUS OF PARTIAL DIFFERENCES, is an improvement on the integral calculus suggested by M. D'Alembert. It applies successfully to some of the most difficult problems, such as those relating to vibrating cords, the propagation of sound, the equilibrium and motion of fluids, tautochrones in resisting media, &c.

When we have a function, z, of two variable quantities, x and y, or of a greater number, we know that by differencing first with respect to x, and then with respect to y, we have the differential $dz = p\,dx + q\,dy$, p and q being co-efficients that affect dx and dy respectively. Thus the complete differential of z is $p\,dx + q\,dy$; where $p\,dx$ and $q\,dy$ are the differentials to which are given the name of partial.

It is usual to denote these co-efficients of dx and dy, in this manner $\frac{dz}{dx}$, $\frac{dz}{dy}$; signifying what happens with regard to the function z, by making it first vary as x and dividing by dx, and then causing it to vary as y and dividing by dy; so that the complete value of dz is represented by $\frac{dz}{dx}dx + \frac{dz}{dy}$: and it is under this form that equations of partial differences commonly present themselves. Thus every equation between z, x, y, $\frac{dz}{dx}$, $\frac{dz}{dy}$, and, if we please, between one or several constant quantities, will be an equation of partial differences: such is, for example, the equation, $a\frac{dz}{dx} + b\frac{dz}{dy} - xy = o$; which signifies, that, in order to the solution of the problem producing this equation, we must find a function of x and y, such that the co-efficient of the differential dx multiplied by a, plus that of dy multiplied by b, shall be $= xy$. This is one of the simplest of this kind of equations, and is called an equation of partial differences of the first order. One of the second order, is of the form $\frac{d^2z}{dx^2} + \frac{d^2z}{axdy} + P = o$: and $\frac{d^3z}{dx^3} + \frac{d^3z}{dy^3} + P = o$, is one of the third order.

To give an idea of the nature and resolution of equations of partial differences, let us take one of the most simple, such as $\frac{dz}{dy} = P$, where P is any function whatever of x, y, and constant quantities. It is required, therefore, to find a function z of x and y, which, differentiated according to y and divided by dy, shall be equal to the given function P. In order to this, multiplying all by dy, we shall have $\frac{dz}{dy}dy = P\,dy$; whence it follows that $P\,dy$ is only a part of the differential of z, namely that which is found by making it vary as y: thus the integral of $\frac{dz}{dy}dy$, which is z (since the preceding expression resulted from the differentiation), making it only vary as y will be equal to S. $P\,dy$ plus, a function which can only be in terms of x, and which, similar to the constant quantity added to every integral to render it complete, can only be determined by the conditions of the problem. Representing indefinitely this function of x by F (x), we shall have $z =$ S. $P\,dy + F(x)$. So likewise, if we had $\frac{dz}{dx} = P$, we should find Z $=$ S. $P\,dx + F(y)$.

We present an example: Let the equation be $\frac{dz}{dy} = axy + y^3$; we shall have evidently S. $P\,dy = \frac{axy^2}{2} + \frac{y^4}{4}$; for in this expression we have only y variable. Thus z will be $= \frac{axy^2}{2} + \frac{y^4}{4} + b + F(x)$. Differencing this equation regarding y only as variable, we shall have $\frac{dz}{dy}dy = (axy + y^3)\,dy = P\,dy$; for F (x), ought not by the nature of the question to give any differential, x being reputed constant with regard to y.

We have, in this example, supposed z to be a function of only two variables, y and x; but it might have been a function of three variables,

ıt the complete value of $d z$ is represented by
$\frac{z}{x} d x + \frac{d z}{d y}$: and it is under this form that
ıations of partial differences commonly present
mselves. Thus every equation between $z, x, y,$
$\frac{z}{x}, \frac{d z}{d y}$, and, if we please, between one or
eral constant quantities, will be an equation
artial differences: such is, for example, the
ation, $a \frac{d z}{d x} + b \frac{d z}{d y} - x y = o$; which sig-
es, that, in order to the solution of the problem
lucing this equation, we must find a function
and y, such that the co-efficient of the dif-
ıtial $d x$ multiplied by a, plus that of $d y$
iplied by b, shall be $= x y$. This is one of
simplest of this kind of equations, and is
d an equation of partial differences of the
order. One of the second order, is of the form
$+ \frac{d^2 z}{a x d y} + P = o$: and $\frac{d^3 z}{d x^3} + \frac{d^3 z}{d y^3}$
$= o$, is one of the third order.
give an idea of the nature and resolution
uations of partial differences, let us take one
most simple, such as $\frac{d z}{d y} = P$, where P
function whatever of x, y, and constant
ıties. It is required, therefore, to find a
on z of x and y, which, differentiated ac-
ıg to y and divided by $d y$, shall be equal to
ven function P. In order to this, multi-
all by $d y$, we shall have $\frac{d z}{d y} d y = P d y$;
e it follows that $P d y$ is only a part of the
ntial of z, namely that which is found by
g it vary as y: thus the integral of $\frac{d z}{d y} d y$,
is z (since the preceding expression re-
from the differentiation), making it only
y will be equal to S. $P d y$ plus, a func-
ıich can only be in terms of x, and which,
to the constant quantity added to every
l to render it complete, can only be de-
ed by the conditions of the problem.
enting indefinitely this function of x by F
shall have $z = $ S. $P d y + F(x)$. So
, if we had $\frac{d z}{d x} = P$, we should find Z
$d x + F(y)$.
present an example: Let the equation be
$x y + y^3$; we shall have evidently S. $P d y =$
$\frac{y^4}{4}$; for in this expression we have only
le. Thus z will be $= \frac{a x y^2}{2} + \frac{y^4}{4} + b$
). Differencing this equation regarding y
ariable, we shall have $\frac{d z}{d y} d y = (a x y + y^3)$
$d y$; for F (x), ought not by the nature
uestion to give any differential, x being
constant with regard to y.
ve, in this example, supposed z to be a
of only two variables, y and x; but it
ve been a function of three variables,

and have one or two partial differentials. Then, and in the first case, the arbitrary function might be a function of two other variables: thus, supposing z was a function of x, y, u, and that we had only one of the partial differences of z, as $\frac{d z}{d x}$, the method of integrating would be the same; we should integrate only with regard to x, and the function to add would be a function of y and u, denoted by F (y, u). Finally, in the case where we should have two partial differences, as $\frac{d z}{d x}, \frac{d z}{d y}$, of the three which would form the complete differential, we should have only to add a function of u, F (u), namely, that of the variable whose partial difference is absent; and thus it would be with a greater number of variable quantities.

But, omitting more complicated examples, we pass to the integral calculus of partial differences; which is the method of finding a function of several variables, when we know the relation of the differential co-efficients of the total differential. What we here call differential co-efficients, are the factors which affect the differentials $d x$, $d y$, $d t$, &c.: these co-efficients may be denoted by p, q, r, &c.; so that $p = \frac{d z}{d x}, q = \frac{d z}{d y}, r = \frac{d z}{d t}$, &c.: and if from hence we pass to the superior orders, we shall have $p^1 = \frac{d d z}{d x^2}, q^1 = \frac{d d z}{d y^2}, r^1 = \frac{d d z}{d t^2}$, &c. Thus, according to this manner of considering the calculus, it is required, having given the relation between p, q, r, &c., to determine the function z; or, otherwise, having given the equation $d z = p d x + q d y + r d t$, &c., and knowing the relation between p, q, and r, or between the differential co-efficients, and one or two of the variables x and y, the problem is reduced to the finding of z.

Let, therefore, the equation be $d z = p d x + q d y$ (limiting ourselves here to a function of two variable quantities), and suppose the relation between p and q to be thus expressed: $- q = a p + b$, where a and b are constant quantities; the value of z is thus obtained. In the preceding equation, putting for q its value $a p + b$, we have $d z = p d x + (a p + b) d y$; whence $d z - b d y = p (d x + a d y)$. But the first member of this equation is integrable, and gives $z - b y$; the second ought therefore to be so, if the differential proposed has an integral: and that this may have place it is necessary that p be a function of $x + a y$; whence it follows that the integral sought will be $z - b y = F(x + a y)$. Thus, we may form a variety of suppositions of relations between z, x, y and p, q, or of these latter between themselves and with the former; and there will result so many particular cases of equations of partial differences to integrate. Euler, in his Calculus Integralis, has given complete instructions on this subject: the reader may likewise advantageously consult Traites du Calcul differentiel et du Calcul Integral du. M. Lacroix.

The calculus of variations, suggested by Lagrange, is that by which, having given an expression or function of two or more variables whose relation is expressed by a determinate law we find what that function becomes when the law itself is supposed to experience any variation indefinitely small, occasioned by the variation of one or of several of the terms which express that law. This calculus is almost the only means of resolving a multitude of problems de maximis et minimis, wherein the difficulty is far greater than in such problems de maximis et minimis, as are the object of the ordinary differential or fluxionary calculus. Such, in this new order of difficulties, is the problem wherein it is required to ascertain the curve which will conduct a falling body in virtue of its acceleration to a given point, right line, or curve, in the least time.

In general every problem of this nature is reduced to finding the maximum or the minimum of a formula such as S. Z $d x$, where Z is a function of x, or of constant quantities, or of x and y, or of x, y, and z, or of more variables: Z may even contain integrals, as S V, &c., or integrals of integrals, as S V S v, &c.; and the methods of taking the variations of these expressions which constitute the rules of the calculus. See Lagrange's Analytical Functions. Cousin, Bossut, and Lacroix, have likewise explained its principles, and shown its applications, in their treatises on the Integral Calculus.

Calculus Tiburtinus, a sort of figured stone, found in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white color, and in shape oblong, round, or echinated. These are a species of the striæ lapideæ, and so like sugar-plumbs, that it is a common jest at Rome to deceive the unexperienced by serving them up at desserts.

CALCUTTA, a city of Bengal, the capital of British India, and a bishop's see, stands upon the eastern bank of the river Bhagrarutti or Hooghly, about 100 miles from the Indian Ocean. It derives its name from Caly, the goddess of time according to the Hindoo mythology, and Cutta, a house or temple: a celebrated erection, to the honor of this goddess, having long stood near the villages of Gobindpore and Chuttanutty. The situation, though very advantageous both for external and internal commerce, vessels of the largest size coming up from the sea, and the Ganges opening a communication with the most northern parts of Hindostan, is considered unhealthy; the country round being marshy, and extensive lakes, with an immense tract of jungle, coming up close to the town. The Sunderbunds, a collection of marshy jungles, though they have been reduced by recent improvements, are still very extensive, and generate in this hot climate those diseases against which few European constitutions can long struggle. The approach to Calcutta is very striking, at full tide the river is about a mile broad, and both banks are lined with the villas of European residents. The spires of the churches, temples and minarets, the company's botanical gardens, and the citadel of Fort William, combine in a magnificent coup d'œil, and exhibit a first impression of the importance of the British possessions on this continent highly interesting and striking. This capital extends in a very various breadth, about six miles along the river. Between the town and Fort William is a noble esplanade, on one side of which appear the best houses of Calcutta, in a line with the new government-house. This is an Ionic structure on a rustic base, the central is the state part of the building, which was erected during the government of the marquis Wellesley. On the north side there is a flight of steps, under which carriages drive to the entrance, and on the south a circular colonnade, surmounted with a dome. The wings at the four corners contain the private apartments, and are connected together by well ventilated circular passages. The other public buildings are the town-house, the two English churches, the courts of justice, and the various places of native Portuguese, Armenian, Greek and Catholic worship. The metropolitan, under the title of bishop of Calcutta, assisted by three archdeacons, has the superintendence of all the ecclesiastical affairs of India; the other clergy are called chaplains, and are all considered as belonging to the military; except those who have charge of the two English churches. There is also a resident clergymen of the church of Scotland, and a church of that communion.

The southern part of Calcutta is occupied almost entirely by Europeans, who have adopted a style of building, at once magnificent in appearance, and well adapted to the climate. Every house of respectability is detached, enclosed with walls, and fronted with an elegant veranda shading a flight of steps. The northern part, which contains perhaps three-fourths of the city, is chiefly inhabited by natives, and is of a totally different appearance. The best houses are of brick, two stories high, and having terraces on the roof, but the far greater part are mere mud or bamboo cottages; the streets are narrow, crowded, unpaved, and filthy. The white ant commits great ravages in all parts of the town, and will sometimes wholly destroy the timbers of a house before any damage appears. Fires are also very frequent in the north part.

What was once the village of Chouringhee, and a mere collection of native huts, is now a splendid suburb of Calcutta, extending into the country a considerable distance. The sides of the principal square are 500 yards in extent, the middle being occupied by a large tank. Here is the old fort and the custom-house, in front of which a handsome quay has been lately constructed. In the back of this village is the burying-ground, no graves being allowed in the church-yard.

Fort William, the strongest fortress in India, stands about a quarter of a mile below the town. It is an octagon, not exact in its sides. Five of them next the land are regular, but the others being designed to guard against an attack by water, are accommodated to the bearing of the guns upon all objects in the river. The interior is very open and extensive; presenting large grass-plats and gravel-walks, shaded by trees intermixed with piles of balls, shells, rows of cannon, and accommodated for 12 or 15,000 men; a house for the commandant, a cannon foundry, and an arsenal, well supplied with stores. The works are so contrived as scarcely to be seen on the land side, but on a very near approach.

Upwards of twenty well furnished bazaars supply the city with all the requisites of life, and the materials of a very lucrative and extensive commerce with every part of the east. Vessels of all sizes, and to the amount of 50,000 tons burden, are often seen off the town: but the larger ships generally stop at Diamond harbour. There are several docks for building ships, and its commerce amounts to nearly £10,000,000 per annum. The tables of all classes here are supplied with game, and those of the wealthy with abundance of plantains, pine-apples, melons, peaches, and oranges. In 1802 the population was computed at 600,000; a few years after, (including the suburbs), at 1,000,000, of which about one-half may be given to the city. And the surrounding districts were said, in the same year, to contain within a space of twenty miles 2,225,000, or more than 1760 persons to a square mile. In the town there are supposed to be about 80,000 houses. In the year 1690 the English first founded a factory here, by virtue of a firman granted to them by the emperor Aurengzebe. In the year 1696, in consequence of a rebellion in Bengal, they were allowed to fortify it. This place is that called the Old Fort, and it is 210 yards in length and about 115 in breadth; and consisting of a rampart and four bastions, with two gates. It contains all the company's store-houses, and a few dwelling-houses. In the year 1698, the prince Azeen Ooshan, grandson of Aurungzebe, granted the Company a perpetual lease of the three villages before mentioned; in the subsequent year, in compliment to king William, the factory was dignified with the title of Fort William. It and the town continued to flourish till the year 1756, when it was taken by the nabob Suraja Dowlah, and the greater part of the garrison were suffocated in the infamous black hole, which is now used as a store room. The nabob now changed its name to Alynagur, but when it was retaken by lord Clive and admiral Watson, in 1757, its former title was restored. The new fort was begun in 1758. Calcutta contains, besides the supreme court of justice, a court for the district of Calcutta, and a number of police magistrates to superintend the peace of the town. There are also courts of appeal from the Calcutta circuit, and from all the other courts of justice of Bengal and its dependencies. The natives out of Calcutta are tried by their own laws. Here are also a College, well endowed by government, and which cultivates any branch of oriental literature with great success; an Asiatic Society, and other literary institutions; a theatre, assembly rooms in abundance, &c.

During the late war with France, the European inhabitants were all embodied into a militia corps of infantry and cavalry, and formerly the city was nearly surrounded by a trench called the Mahratta ditch, but it has been for some time dry. Ascending the river from Calcutta we arrive at Barnagore, a village on the east bank, where the Dutch had formerly a fort. Serampore, on the right bank, ten miles above Calcutta, is a Danish settlement, consisting of a few factors' houses, and a native town, with a battery for saluting. Here are the chief establishments of the Baptist mission. Accounts are kept here in

CALCARIA Judiciaria, in our ancient barbarous customs, the method of trial by boiling water. See Ordeal.

CALDARIUM, in the ancient baths, 1. A brazen vessel of hot water, placed in the hypocaustum, to be drawn thence into the piscina or bath, to give it the proper heat: 2. A stove or sudatory, being a close vaulted room, wherein by hot dry fumes, without water, people were brought into a profuse perspiration.

CALDERON (Don Pedro, De la Barca), a Spanish officer, who, after having signalised himself in the military profession, quitted it for the ecclesiastical, and then commenced dramatic writer. His dramatic works make 17 vols. in 4to. Some Spanish writers have compared him to Shakspeare. He flourished about 1640.

CALDERWOOD (David), a divine of the church of Scotland, and a distinguished writer in behalf of the Presbyterians. He was settled about 1604 at Crelling near Jedburg. Being desirous of bringing the church of Scotland nearer to a conformity with that of England, King James I. earnestly endeavoured to restore the episcopal authority, and enlarge the powers of the Scotch bishops. This was very warmly opposed by many of the ministers, particularly by Mr. Calderwood; who, when James Law, bishop of Orkney, came to visit the presbyteries of Merse and Teviotdale, declined his jurisdiction, by a paper dated May 5th, 1608. In May, the next year, king James went to Scotland; and on the 17th June held a parliament at Edinburgh: when the clergy met in one of the churches, to advise with the bishops. This assembly was contrived in order to resemble the English convocation. To this Mr. Calderwood objected; and on hearing of their intention to pass a bill, empowering James to alter the constitutions of the church, he, with several other ministers, protested, and said that they would rather submit to any penal law than obey such an authority. This protest was presented to the clerk register, who refused to read it before the states. However, though not read, it had its effect; for although the bill had the consent of parliament, yet the king caused it to be laid aside, and not long after called a general assembly at St. Andrews. Soon after, the parliament was dissolved, and Mr. Calderwood was summoned to appear before the high commission court at St. Andrews, to answer for his mutinous and seditious behaviour. The king came to that city in person; and Mr. Calderwood, refusing to comply with what the king in person required of him, was imprisoned. Afterwards the privy council ordered him to banish himself out of the king's dominions before Michaelmas, and not to return without licence. Having unsuccessfully applied to the king for a prorogation of his sentence, he retired to Holland, where, in 1623, he published his celebrated piece entitled Altare Damascenum, in which he attacks the church of England with great asperity. He returned home and remained some time in obscurity. During his retirement, he collected all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation to the death of king James; which collection is still preserved in the university library in Glasgow. In 1643 he was employed in drawing up the Form of the Directory for the public Worship of God by the General Assembly. He died at Jedburg about 1652.

CAL'DRON, Lat. *caldarium*; Fr. *chaudron*. A large pot or boiler.

> In the midst of all
> There placed was a *caldron* wide and tall,
> Upon a mighty furnace, burning hot.
>
> *Faerie Queene.*

> Fire burn; and *cauldron* bubble. *Shakspeare.*

> And now about the *cauldron* sing
> Like elves and fairies in a ring,
> Enchanting all that you put in. *Id.*

And the priest's custom was, that when any man offered sacrifice, the priest's servant came while the flesh was in seething, with a flesh-hook of three teeth in his hand: and he struck it into the pan, or kettle, or *caldron*, or pot, all that the flesh-hook brought up the priest took for himself. 1 *Sam.* ii. 14.

> Some strip the skin; some portion out the spoil;
> The limbs, yet trembling, in the *caldrons* boil;
> Some on the fire the reeking entrails broil.
>
> *Dryden's Æneid.*

In the late eruptions, this great hollow was like a vast *caldron*, filled with glowing and melted matter, which, as it boiled over in any part, ran down the sides of the mountain. *Addison.*

CALDWALL (Richard), a learned English physician, born in Staffordshire, about 1513. He studied physic at Oxford; and was examined, admitted into, and made censor of, the college of physicians at London, all in one day. Six weeks after he was chosen one of the elects; and in 1570, president. He wrote several medical pieces, and translated a book on the art of surgery, written by one Horatio More, a Florentine physician. Camden says that Caldwall founded a chirurgical lecture in the college of physicians and endowed it with a handsome salary. He died in 1585.

CALE, or Kale, a species of brassica.

Cale (la), a French punishment, inflicted when a soldier, or sailor, maliciously wounds another. The offender is tied to the yard arm, suddenly plunged into the sea and then drawn up again, as often his offence merits.

CALEB, in botany, a genus of the polygamia æqualis order, and syngenesia class of plants; natural order, forty-ninth, compositæ. Receptacle paleaceous, the pappus hairy, calyx imbricated. There are eight species, natives of the West Indies.

Caleb, the son of Jephunneh, of the tribe of Judah, one of the twelve spies who were sent to view the land of Canaan, and the only one who joined with Joshua in giving a favorable report of it. His capture of Hebron, defeat of the Anakims, and portioning of his daughter Achsah, are recorded in Josh. xiv. 6. 15, xv. 13. 19, and Judg. i. 9, 15. This hero had three sons and a numerous posterity.

CALEDONIA, the ancient name of Scotland. From Tacitus, Dio, and Solinus, we find that ancient Caledonia comprehended all that country lying north of the Forth and Clyde. In proportion as the Silures or Cimbri advanced toward the north, the Caledonians, being more circumscribed, were forced to emigrate into the islands on the western coasts of Scotland. It is in this period, probably, we ought to place the first great migration of the British Gael into Ireland; that kingdom being much nearer to Galloway and Cantire, than many of the Scottish isles are to the continent of North Britain. To the country which the Caledonians possessed, they gave the name of Cael-doch; which is the only appellation the Scots, who speak the Gaelic language, know for their own division of Britain. Cael-doch is a compound of Gael or Cael, the first colony of the ancient Gauls who emigrated into Britain, and doch, a district or division. The Romans, by transposing the letter l in Cael, and by softening into a Latin termination the ch of doch, formed the well known name of Caledonia. This appears to be a much more natural etymology than that of Camden, from the old British word kaled, hard, because the people were a hardy rustic race. See SCOTLAND.

CALEDONIA, NEW, an island in the South Sea, discovered by Captain Cook, and next to New Holland and New Zealand, the largest that has been discovered in that sea. It extends from 19° 37′ to 22° 30′ S. lat. and from 163° 37′ to 167° 14′ E. long. Its length from north-west to south-west is about eighty leagues; but its greatest breadth does not exceed ten leagues. This island is diversified by hills and valleys, amongst which issue abundance of rivulets. Along its north-east shore the land is flat; well watered, and cultivated; but the mountains and higher parts of the land are in general barren. The country in general bears a great resemblance to those parts of New South Wales, which lie under the same parallel. Its natural productions are also generally the same, and the woods are without underwood, as in that country. The whole coast is surrounded by reefs and shoals which render access to it dangerous; but every part seems inhabited. The natives begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preserving its vigor by manure; they, however, recruit it by letting it lie for some years untouched. New Caledonia seems to differ from all the other islands yet discovered in the South Sea, in being entirely destitute of volcanic productions. New species of several plants were found, particularly a new passion-flower; and a few young bread-fruit trees not sufficiently grown to bear fruit; plantains and sugar-canes are found here also in small quantity, and cocoa nut trees are small and thinly planted. Caputi or Melaleuca trees were also found in flower Mosquitoes are very numerous. A great variety of birds were seen, for the most part entirely new; particularly a beautiful species of parrot before unknown. A new species of fish, of the genus tetraodon, was caught by captain Cook's people, and after some hesitation cooked and eaten. Its oiliness, happily, though it had no other bad taste, prevented them from taking above a morsel or two. In a few hours after they had retired to rest, they were awakened by alarming symptoms, being all seized with an extreme giddiness: their hands and feet benumbed, so that they were scarcely able to move; and great languor and oppression coming over them. Emetics were administered with some success, but sudorifics relieved them. But the effects of this poison did not go off entirely for six weeks. There are great numbers of turtles on this island. The houses are circular huts, something like a bee-hive, and full as close and warm; they commonly erect two or three near each other under a cluster of lofty fig-trees, whose leaves are impervious to the sun. Their canoes are clumsy vessels, made of two trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk head of the same height; so that the whole is like a long square trough, about three feet shorter than the body of the canoe. Two thus fitted are fastened to each other about three feet asunder, by means of cross spars, which project about a foot over each side. A deck is laid over them, made of plank and small round spars, on which they have a hearth, and generally a fire burning; they are navigated by one or two latteen sails, extended to a small latteen yard, the end of which is fixed to a notch in the deck. The inhabitants are robust, in general well proportioned, and of honest dispositions. A few measured six feet four inches. Some wear their hair long and tie it up to the crown of their heads; others suffer only a large lock to grow on each side, which they tie up in clubs; many others as well as all the women wear it cropt short. The men go almost entirely naked. The dress of the women who are of modest character, is a short petticoat or fringe, consisting of filaments or little cords, about eight inches long, fastened to a very long string, which they tie several times round their waist. The married women wear a black and the unmarried a white petticoat. The general ornaments of both sexes are ear-rings, necklaces, amulets, and bracelets made of shells, stones, &c. Their fishing tackle they prize above everything. Notwithstanding their inoffensive disposition, these islanders are well provided with clubs, spears, darts, and slings: their clubs are about two feet and a half long, and variously formed; some like a scythe, others like a pick-axe; some with a head like a hawk, others with round heads; but all neatly made, and ornamented. The slings are simple, but they form the stones into a shape something like an egg. They drive the dart by the assistance of short cords knobbed at one end and looped at the other, called by the seamen beckets. These contain a quantity of red wool taken from the great Indian bat. Bows and arrows are wholly

ntity of red wool taken from the
bat. Bows and arrows are wholly

unknown among them, and their language bears little affinity to that spoken in the other South Sea islands; their only musical instrument is a kind of whistle of brown wood, about two inches long. Many of them were observed to have their legs and arms much swelled with a kind of leprosy. Lieutenant Pickersgill was showed a chief whom they named Tea-beoma, and styled their arrekee or king; but nothing further is known of their government, and nothing at all of their religion. The French expedition called here in 1793, and found the inhabitants much altered for the worse both in their manners and condition. Many groups of herds were deserted, and cultivated land abandoned: in 1774 it was supposed to have had 50,000 inhabitants, but seems at this last visit to have declined greatly. Long. 163° 3;′ lat. 20° S.

CALEDONICA, in ornithology, a species of ardea, the Caledonian night heron of Latham. The general color of the plumage is ferruginous and white beneath: legs yellow; crest on the back of the head of three feathers; bill and frontlet black, eye-brows white, area of the eyes green.

CALEFACIENTIA, or CALEFACIENTS, in medicine, heating or warming medicines.

CALEFACTION may be defined, the production of heat in a body from the action of fire, or that impulse impressed by a hot body on others around it. It is used in pharmacy, by way of distinction from coction, which implies boiling. Medicines of this kind diffuse a sensation of warmth by their immediate impression on the nerves, without any actual increase of the temperature; they also tend to accelerate the circulation, and therefore to augment the actual heat. It has been ascertained that the animal temperature is generated by the chemical changes which take place in the blood in the course of circulation, in consequence of the absorption and evolution of different gaseous fluids. Whenever, therefore, the rapidity of the circulation at large is increased, by general stimulants; or the vessels of any part are, by a local stimulas, excited to greater action, and transmit a larger proportion of blood; the evolution of heat will necessarily be augmented; and there will be a sensation of warmth in the general system in all its parts.

CALENBERG, a principality of Lower Saxony, one of the four divisions of Brunswick; bounded on the north by the duchy of Verden, on the east by the principality of Zell, on the south by those of Grubenhagen and Wolfenbuttle, and on the west by Westphalia. See BRUNSWICK.

CALENBERG, a castle of Germany, in the principality seated on the river Leine, fifteen miles south of Hanover, and subject to the King of Hanover. Long. 9° 43′ E., lat. 52° 20′ N.

CALENDAR, in astronomy and chronology. See CHRONOLOGY. The late revolutionary calendar of the French was a distribution of time entirely new, adopted by the Convention, soon after the abolition of royalty, in 1792; and still continued with little alteration until 1801. The year commenced at midnight, on the beginning of that day, on which the true autumnal equinox falls, by the observatory of Paris. It was divided into twelve equal months, of thirty days each; after which five supplementary days were added, to complete the 365 days of the ordinary year. These five days did not belong to any month. They were first named sans-culottides, in honor of the sans-culottes, or inferior ranks of society; but this name was changed soon after the revolution in July 1794. Each month was divided into three decades of ten days each; distinguished by first, second, and third decade. The years that received an intercalary day, when the position of the equinox requires it, which we call embolismic, bissextile, or leap-years, the French called olympic; and the period of four years, ending with an olympic year, an olympiad. The intercalary day, on that occasion, was placed after the ordinary five supplementary days, and being the last day of the olympic year, was dedicated to olympic games to be celebrated in honor of the revolution; and to the renovation of the national oath, 'To live free or die.' The months had all new names expressive of their respective relations, either to the season of the year, the temperature of the air, or the state of the vegetation. Each day from midnight to midnight, was divided into ten parts, each part into ten others, and so on to the last measurable portion of time. The days of the decade were denominated from the first ten numbers, thus; Primdi, Duodi, Tridi, Quatridi, Quintidi, Sextidi, Septidi, Octidi, Nonidi, Decadi. In the almanac, or annual calendar, instead of the numerous names of saints, in the popish calendars, every day was inscribed with the name of some animal, utensil, work, fruit, flower, or vegetable, suited to the day or the season. As a curious relic of the revolution, and containing some improvements mixed with far more serious objections, we subjoin

THE NAMES OF THE MONTHS AND SUPPLEMENTARY DAYS.

	NAMES.	SIGNIFICATION.		DURATION.		
AUTUMN.	Vendemiaire,	Vintage month,	from	Sept. 22.	to	Oct. 21.
	Brumaire,	Fog month,	——	Oct. 22.	—	Nov. 20.
	Frimaire,	Sleet month,	——	Nov. 21	—	Dec. 20.
WINTER.	Nivose,	Snow month,	——	Dec. 21.	—	Jan. 19.
	Pluviose,	Rainy month.	——	Jan. 20.	—	Feb. 18.
	Ventose,	Windy month.	——	Feb. 19.	—	March 20.
SPRING.	Germinal,	Bud month,	——	March 21.	—	April 19.
	Floreal,	Flower month,	——	April 20.	—	May 19.
	Prairial,	Pasture month,	——	May 20.	—	June 18.
SUMMER.	Messidor,	Harvest month,	——	June 19.	—	July 18.
	Thermidor,	Hot month,	——	July 19.	—	Aug. 17.
	Fructidor,	Fruit month,	——	Aug. 19.	—	Sept. 16.

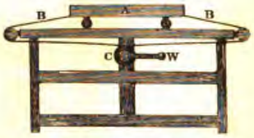
CALENDAR OF PRISONERS, in law, a list of all the prisoners' names in the custody of each sheriff. See EXECUTION.

CALENDARIUM FESTUM. The Christians retained much of the ceremony and wantonness of the calends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names of festum kalendarium, or hypodiaconorum, or stultorum, i. e. the feast of fools. The people met masked in the church, and in a ludicrous way proceeded to the election of a mock pope, who exercised a jurisdiction over them suited to the festivity of the occasion. Fathers, councils, and popes, long labored to restrain this licence, to little purpose. The feast of the calends was in being as low as the close of the fifteenth century.

CAL'ENDER, *v.* & *n.* }
CAL'ENDERER, *n.* } Lat. *cylindrus*; Fr. *calandrer*; a hot press, an iron cylinder filled with hot coals. To calender is, with this instrument to hot-press; to dress cloth; to lay the nap of cloth smooth. A calender is also a press in which clothiers smooth their cloth.

CALENDER is a machine used for pressing silks, stuffs, calicoes, or linens; to make them smooth, even, and glossy. It is also used for watering, or giving the waves to tabbies and mohairs. The word came into our language perhaps immediately from the French calandre, which is derived from the Latin cylindrus: because the whole effect of the machine depends upon cylinders.

These commonly consist of two large wooden rollers, round which the pieces are wound; they are then put between two large, close, polished planks of wood, or plates of iron, the lower serving as a fixed base, and the upper being movable, by means of a wheel like that of a crane, with a rope, fastened to a spindle, which makes its axis; this upper part is of a prodigious weight, sometimes twenty or thirty thousand pounds. It is the weight of this part, together with its alternate motion, that gives the polish, and makes the waves on the stuffs, by causing the cylinders on which they are put to roll with great force over the lower board. The rollers are taken off, and put on again by inclining the machine. The French used formerly an extraordinary machine, called the royal calender, made by order of M. Colbert; the lower table or plank of which was made of a block of smooth marble, and the upper lined at bottom with a plate of polished copper. This was called the great calender, they have also a small one with tables of polished iron or steel. Calenders without wheels are sometimes wrought by a horse harnessed to a wooden bar, which turns a large arbor placed upright; at the top of which, on a kind of drum, is wound a rope, the two ends of which, being fastened to the extremities of the upper plank of the engine, give it motion. But the horse calender is in little esteem. Worsteds are sometimes calendered in the thread. Domestically this operation is also known by the name of mangling; and a section of the useful machine once so common in England, is seen below.



This is in fact merely a strong level table, with a stout cover, and made of well seasoned wood to prevent its casting. The cloth being smoothly spread upon it, the coffer A, which is placed upon two smoothly turned rollers of iron, is made to move alternately from one end of the table to the other, until the cloth is sufficiently smoothed, when a fresh portion is spread upon the table, and the operation repeated until the process is finished with the whole. The cloth may be very regularly and quickly drawn along the table, by unwinding it from a roller at one end, and winding it upon a similar roller at the other. If it be desirable occasionally to employ heat, it may be done by casting the iron rollers of the coffer, A, hollow, and filling the cavity with small cylinders of cast iron, previously heated. The motion is communicated to the coffer, A, by two belts, cords, or chains B, B, which, after passing over a pulley at either end of the table, are wound round the cylinder or barrel C. By turning a handle or winch, W, the barrel is moved round, and the motion communicated to the box in either direction.

While the foregoing machine has been found very serviceable in large families, and will shorten the operation of ironing, as it is termed, by disposing quite as neatly of bed linen and large clothes; for purposes of business, what has been called the five bowl calender is generally used. This machine is usually set in motion by a horse, or in large manufactories by water wheels, or the steam engine; we give in our plate CALENDERING an elevation of it. Fig. 1. is a front elevation. The frame work, A, consists of three strong pieces of hard wood, and sometimes of cast iron, two of them upright (made generally of 12-in. by 6 stuff), and connected by a transverse piece at top equally stout, and perhaps by a cross rail below; both being well secured by screw bolts, as upon them bears the whole stress of the machine. What are called the bowls, or calenders, are placed one above the other between the top and the bottom. Of these the bowls marked *e* and *i*, are generally of the same diameter, and made of hard wood or iron. In working the machine, the whole five bowls are made to revolve on their respective axes, each moving in an inverted direction to that next it, or with which it

moves; and the revolutions are in an inverse ratio to the diameters, exposing an equal portion of the circumference of each to that of the other against which it presses. A belt passing over and turning the pullies at D, communicates the motion; a pully being fast upon the axis of the main cylinder *g*. *f* and *h* receive their motions by means of the wheels C C being worked with B, affixed to the axis of *g e* and *i*, by their regular friction upon *f* and *h*. The cloth is placed first down the front of *e*, and behind *f*; then in front of *g*, and behind *h*, finally it comes out in front of *i*, and falls down on a clean board or into a box contrived to receive it. The folding it up smoothly and carefully, now prepares the cloth for pressing. This is generally done by placing a certain number of pieces between thin smooth boards of wood, and pieces of glazed pasteboard above and below every piece of cloth. For the common screw press, water presses on the principle of Mr. Bramah's forcing press have been lately introduced, and by this means, while the strength of a child is sufficient for the operation, its power may be rendered greater than almost any ordinary exertion of human force. Their successful operation, however, depending greatly upon local circumstances, they have not as yet superseded the common screw press in Glasgow and Manchester. See Hydraulics.

f, and *h*, as we have said, are generally hard wood or cast iron cylinders, and the main cylinder or bowl *g*, used formerly to be made of wood. But in Lancashire, what have been called paper bowls are now generally preferred. Its first cost is five or six times as great as that of a wooden one, but its advantage is, that it never warps or splits, and takes eventually a much smoother surface, while it presses better against every part of the cloth. The construction of the paper bowl is thus explained in Dr. Brewster's Encyclopedia. The axis of the cylinder is a square bar of malleable iron, of the proper length. Upon this is first put a strong round plate of cast iron, of the diameter intended for the cylinder when finished. A quantity of thick stout pasteboard is then procured, and cut into round pieces, rather larger in the diameter than the iron plate. In the plates, and in every piece of the pasteboard, a square hole must be cut in the centre to receive the axis; and the circle being divided into four or five equal parts, a hole must also be cut at each of the divisions, an inch or two within the rim. These pieces of pasteboard being successively put upon the axis, a long rod of malleable iron, with a head at one end, and screwed at the other, is also introduced through each of the holes near the rim, and this is continued until a sufficient number are thus placed to form a cylinder of the length required, proper allowance being made for the compression which the pasteboard is afterwards to undergo. Another round plate is then put on, and nuts being put upon the screws, the whole are screwed tight, and a cylinder formed. The cylinder is now to be placed in a stove, exposed to a strong heat, and must be kept there for at least several days; and, as the pasteboard shrinks by exposure to the heat, the screws must be frequently tightened until the whole mass has been compressed as much as possible. When the cylinder is thus brought to a sufficient degree of density, it is removed from the stove; and, when allowed to cool, the expansion of the pasteboard forms a substance almost inconceivably dense and hard. Nothing now remains but to turn the cylinder, and this is an operation of no slight labor and patience. The motion in turning must be slow, not exceeding forty revolutions in a minute, and the substance is now so hard and tough, that tools of a very small size must be used to cut or scrape it until true. Three men are generally employed for the turning, even when the motion of the cylinder is effected by mechanical power, two being necessary to sharpen tools for the third who turns, so quickly are they blunted.

This useful engine was first introduced into this country by the Hugonots, driven by persecution from France and Holland. Lawns and muslins being of light texture, require a machine of lighter power and pressure. This is represented in our plate Calendering, fig. 2, and consists of three cylinders of equal diameters (generally about six inches), easily moved by a common winch or handle at F. The central cylinder is iron, and the others wood or pasteboard. They are moved with equal velocities by the small wheels at E. The machine is always used cold.

The Glazing Calender, an improvement upon the common five-bowl calender for the purposes of glazing cloth, was first invented by the superintendent of Mr. Miller's works of Glasgow: a profile view and description of the machine are furnished in the Edinburgh Encyclopædia, whence we extract it. The machine is exhibited in fig. 3 of our plate. It consists of five bowls or cylinders, like the common calender, but instead of those bowls revolving with a velocity in the inverse ratio of their respective diameters, so as always to present an equal surface, and to act merely by their pressure against each other, the bowls or cylinders *f* and *h* move with greater velocity than the bowls *e*, *g*, and *i*, and thus create or generate friction at three several parts of the operation. This difference is produced merely by the addition of a few wheels; and the difference between the common and glazing calender will be seen at a single glance, by comparing the wheel work of figs. 1. and 3. In fig. 1 the motion of all the cylinders is in the inverse ratio of their diameters, so that each presents an equal surface. In fig. 3 the motion, instead of being directly communicated from 9 to 7, as in fig. 1, is given by the intervention of two additional wheels. The increase of motion depending entirely on the relative number of the wheels B and C, on the axis of the cylinders 9 and 7 to each other (for the intermediate wheels E and F merely communicate the motion without affecting the velocity), 9 is made to revolve considerably quicker than in the common calender, and thus the necessary friction is created. To reduce the glazing to the common calender, it is only necessary to remove the wheels E and F entirely, and to substitute a larger wheel for the wheel B, which may be calculated to work directly into the wheel C. The profile view given in this figure affords opportunity also of showing the way in which the cloth is conducted from the table H over the roller I, through the calender, and received again at G. This is common to both calenders. A patent for Scotland was taken for the glazing calender; and, upon a trial of some years, it has met with the entire approbation of those who have been in habits of having their goods glazed by it. As one machine, by being worked day and night, is capable of glazing nearly 1000 pieces of cloth of twenty-eight yards each, in a week, it is peculiarly adapted for the occasional hurry to which shippers are sometimes unavoidably subjected.

Calenders, a sect of dervises, or Mahommedan friars, the disciples of Santon Calenderi. They are rather a sect of Epicureans than a society of religious. They honor a tavern as much as a mosque, and think they pay as acceptable worship to God by the free use of his creatures as others do by the greatest austerities and acts of devotion. They are called in Persia, and Arabia, Abdals or Abdallat, i. e. persons consecrated to the honor and service of God. Their garment is a single coat, of a variety of pieces, quilted like a rug. They preach in the market-places, and live upon what their auditors bestow upon them.

CAL'ENDS, *n.*
Cal'endar, *v.* & *n.*
Calen'dographer. } Lat. *calendarium*. An almanac, or yearly register, in which the months and stated times are marked as festivals and holidays. The first days of the months were denominated kalends. The word means calling, or proclaiming, and was applied to these particular days, because on them it was declared, or announced, whether the nones of the months should be five or seven. To calendar, is to record, or register.

Twenty-five years have I but gone in travail
Of you my sons; nor till this present hour,
My heavy burdens are delivered :—
The duke my husband, and my children both,
And you the *calendars* of their nativity,
Go to a gospel's feast, and go with me.
Shakspeare. Comedy of Errors.

What hath this day deserved? what hath it done,
That it in golden letter should be set
Among the high tides, in the *calendar*?
Shakspeare. King John.

We compute from *calendars* differing from one another; the compute of the one anticipating that of the other. *Brown.*

Cursed be the day when first I did appear;
Let it be blotted from the *calendar*,
Lest it pollute the month! *Dryden's Fables.*

Experienced men, inured to city ways,
Heed not the *calendar* to count their days. *Gay.*

Calends, in Roman antiquity. See Kalends.

Calends, Greek, a proverbial expression among the Romans, adopted into most modern languages, signifying never, because the Greeks had no calends.

CALENDULA, in botany, the marigold; a genus of the polygamia necessaria order, and syngenesia class of plants; natural order forty-ninth, compositæ. The receptacle is naked; there is no pappus: cal. polyphyllous and equal; the seeds of the disk membranaceous. Of this there are twenty-five species; natives of the Cape and South of Europe. They are so well known as to need no description except— C. fructicosa, which some years ago was introduced from the Cape of Good Hope. It has a slender shrubby perennial stalk, rising to seven or eight feet, but requiring support: this sends out a great number of weak branches, from the bottom to the top, which hang downward unless supported: they are garnished with oval leaves, having short flat foot-stalks, of a shining green color on their upper side, but pale underneath. The flowers come out at the end of the branches, on short naked foot-stalks. The flowers of the common marigold have been exhibited medicinally: as aperients in uterine obstructions and icteric disorders, and as diaphoretics in exanthematous fevers. The leaves of the plant are stimulating, aperient, and antiscorbutic.

Calendula, in ornithology, a species of the motacilla, found in Pennsylvania. The color is greenish ash, the crown having a deep yellow hue, and the abdomen and wings yellowish beneath. This is the roitelet rubis of Buffon, the ruby crowned wren of Latham, and calendula Pennsylvanica of Brisson.

CALENS, in entomology, a species of chrysis of a large size: color glossy blue; abdomen golden; tail blue and armed with four teeth. Found in Siberia. Also a species of cimex found in India. The head, thorax, and wing-cases, are black, scutel fulvous.

CAL'ENTURE, Lat. *caleo*; Span. *calentar*, *calentura*; the word signifies to heat; a fever. Dr. Johnson says, it is a disease peculiar to sailors in a hot climate, wherein they imagine the sea to be green fields, and will throw themselves into it. This sense may be gathered from some of the following illustrations :—

Thus said the scarlett whore to her gallant,
Who strait designed his brother to supplant;
Fiends of ambition here his soul possessed,
And thirst of empire *calentured* his breast. *Marvell.*

And for that lethargy there was no cure,
But to be cast into a *calenture*. *Denham.*

So, by a *calenture* misled,
  The mariner with rapture sees,
On the smooth ocean's azure bed,
  Enamelled fields and verdant trees:
With eager haste he longs to rove
  In that fantastic scene, and thinks
It must be some enchanted grove;
  And in he leaps, and down he sinks.
Swift.

Calenture, in medicine, is a disease more frequently mentioned by former than by any later writers of credit. Dr. Stubbs (Philosph. Transact. No. 36.) relates two cases which occurred during a voyage to Jamaica. They were accompanied with delirium, independent of fever, and produced by disorders in the stomach and bowels. The symptoms were therefore quickly removed by an emetic. The popular definition describes it as a distemper peculiar to seamen in hot climates, in which they imagine the

lentura; the word signifies to heat; a fever.
r. Johnson says, it is a disease peculiar to
ilors in a hot climate, wherein they imagine
e sea to be green fields, and will throw them-
lves into it. This sense may be gathered from
me of the following illustrations:—

Thus said the scarlett whore to her gallant,
Who strait designed his brother to supplant;
Fiends of ambition here his soul possessed,
And thirst of empire *calentured* his breast. *Howel.*

And for that lethargy there was no cure,
But to be cast into a *calenture*. *Denham.*

So, by a *calenture* misled,
The mariner with rapture sees,
On the smooth ocean's azure bed,
Enamelled fields and verdant trees:
With eager haste he longs to rove
In that fantastic scene, and thinks
It must be some enchanted grove;
And in he leaps, and down he sinks. *Swift.*

Calenture, in medicine, is a disease more
quently mentioned by former than by any
er writers of credit. Dr. Stubbs (Philosph.
ansact. No. 36.) relates two cases which oc-
rred during a voyage to Jamaica. They were
companied with delirium, independent of
er, and produced by disorders in the stomach
l bowels. The symptoms were therefore
ckly removed by an emetic. The popular
inition describes it as a distemper peculiar to
men in hot climates, in which they imagine the

---

sea to be green fields and will throw themselves into it. Such is the common idea; but it is most probable that the natural wish of a febrile delirium to cool the body, by leaping into water, has in this case been mistaken for the imagination of green fields &c. in the sea. A calenture has been cured by vomiting, bleeding, a spare diet and the neutral salts; a single vomit commonly removing the delirium, and the cooling medicines completing the cure.

CALES, in ancient geography, a municipal city of some note in Campania near Casilinum.

CALF, *n.*
Calve', *v.*
Calf'-like,
Cal'vish,
Calf'-head,
Calf'-skin.

Teut. *kable*, *kalbe*; Sax. cealf; Swed. *kalf*; Arm. *kelve*, apparently from Goth. *ko*, a cow, and *alf*, progeny; *ala*, *afla*, to bring forth. Milton uses the word in this general sense; but its common acceptation is the young of a cow. The same word, differently derived, signifies the thick part of the leg. Goth. and Swed. *kafle*, is a round stump.

I would they were barbarians, as they are,
Though in Rome littered; no Romans, as they are not,
Though *calved* in the porch o' the' capitol.
Shakspeare.

When she's *calved*, then set the dam aside,
And for the tender progeny provide. *Dryden.*

The colt hath about four years of growth; and so the fawn, and so the *calf*. *Bacon's Natural History.*

Acosta tells us of a fowl in Peru, called condore, which will kill and eat up a whole *calf* at a time. *Wilkins.*

Ah, Blouzelind! I love thee more by half
Than does their fawns, or cows the new-fallen *calf*.
Gay.

The witless lamb may sport upon the plain,
The frisking kid delight the gaping swain;
The wanton *calf* may skip with many a bound,
And my cur, Tray, play deftest feats around;
But neither lamb, nor kid, nor *calf*, nor Tray,
Dance like Buxoma on the first of May. *Id.*

When waggish boys the stunted besom ply,
To rid the slabby pavement; pass not by
Ere thou hast held their hands; some heedless flirt
Will overspread thy *calves* with spattering dirt. *Id.*

Calf, in husbandry. A calf should be allowed to suck and follow its mother during the first six or eight days; after this it begins to eat pretty well. But if the object be to have it quickly fattened for the market, a few raw eggs every day, with boiled milk, and a little bread, will make it excellent veal in four or five weeks. This applies only to such as are designed for the butcher. When intended to be brought up, they ought to have at least two months suck; as the longer they suck, the stronger and larger they grow. Those that are brought forth in April, May, or June, are the most proper for this; when calved later, they do not acquire sufficient strength to support them during the winter. There are two ways of breeding calves intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have sucked about a fortnight; they are then to be taught to drink flat milk, which is to be made but just warm, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May; they should have milk for twelve weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger quantities. When they have been fed on milk for a month, little wisps of hay should be placed about them, in cleft sticks, to induce them to eat. In the beginning of April they should be turned out to grass; only, for a few days, they should be taken in at night, and have milk and water, till they are so able to feed themselves that they do not regard it. The grass must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at grass; for if it be done with hay and water, they often grow big-bellied and rot. When those are selected which are to be kept as bulls, the rest should be gelded; the sooner the better. Between ten and twenty days is the proper age. About London almost all the calves are fatted for the butcher, as there is a good market for them, and the lands are not so profitable to breed upon as in cheaper countries. The way to make calves fat and fine is to keep them very clean; give them fresh litter every day; and to hang a large chalk-stone, where they can easily get at it to lick it, but out of the way of being fouled by the dung and urine. The coops are to be placed so as not to have too much sun, and so high above the ground that the urine may run off. Some bleed them once when they are a month old, and a second time before they kill them; which greatly whitens the flesh; the bleeding is, by some, repeated oftener, but this is sufficient. Calves are very apt to be loose in their bowels; which wastes and very much injures them. The remedy is to give them, from a horn, chalk scraped among milk. If it does not succeed, give them bole armoniac in large doses, and use the cold bath every morning. If a cow will not let a strange calf suck her, the common method is to rub both her nose and the calf's with a little brandy, which generally reconciles them.

Calf, in zoology. See Bos.

Calf, Golden, an idol, set up and worshiped by the Israelites at the foot of mount Sinai. Our version makes Aaron fashion this calf with a graving tool after he had cast it in a mould: the Geneva translation makes him engrave it first, and cast it afterwards. Others, render the whole verse thus; 'And Aaron received them (the golden earings), and tied them up in a bag, and got them cast into a molten calf;' which version is authorised by the different senses of the word tzur, which signifies to tie up or bind, as well as to shape or form; and of the word cherret, which is used both for a graving tool and a bag. See Aaron. This calf Moses is said to have burnt with fire, ground to powder, and strewed upon the water which the people were to drink. How this could be accomplished has been a question. Many have thought, that as gold is indestructible, it could only be burnt by the miraculous power of God; but M. Stahl conjectures, that Moses dissolved it by means of liver of sulphur. See Chemistry, Index. M. Voltaire, in his Essa on Toleration (in other respects an excelle work), argues much upon the impossibility of grinding to powder so ductile a metal as gold; but any goldsmith could have informed him, that nothing is easier; for the purest gold may at any time be made as brittle as glass, by mixing with it a small quantity of brass; nay, such an antipathy exists between the two metals, that gold, in working, will often become quite unmalleable, by only accidentally touching a piece of brass, while it is warm. And if we suppose the Egyptian goldsmiths to have been as fond of profit, as the modern jewellers of Europe, it is probable they might have put brass pins (a practice now not uncommon) in the joints of the gold earrings, which they had sold or lent to the Hebrew ladies; in which case, the whole mass being melted together, when the calf was made, Moses would require no miraculous power to enable him to grind it to powder; nor would he even need to throw in any additional quantity of brass, to render it brittle, when he burnt, or melted, it, (as perhaps the word should be rendered) with fire.

Calf, Sea. See Phoca.

Calf-Skins, in the leather manufacture, are prepared and dressed by the tanners, skinners, and curriers, who sell them for the use of shoe makers, sadlers, book-binders, and others, who employ them in their several manufactures. The English calf-skin is much valued abroad, and the sale of it very considerable in France and other countries; where attempts have been made to imitate it, but in vain; the smallness and weakness of the calves about Paris, which at fifteen days old are not so big as the English ones when newly calved, being an insurmountable obstacle.

CALFAT, in ornithology, a species of emberiza; rather smaller than the common sparrow: color hoary; vinaceous beneath; head, throat, and margin of the tail, black; bill, legs, and orbits, red. This is le Calfat of Buffon, and the red eyed bunting of Latham; and is found at Madagascar.

CAL'IBER, } Fr. *calibre*; from Lat. *cava-*
Cal'iver, } *libra*; measure of a tube; but
Cal'ibre. } χαλα was an instrument for
measuring. It signifies the bore of fire arms; metaphorically applied to the quality, state, or degree; the size or dimensions of intellect, worth, or estimation.

> They could not but be convinced, that declamations of this kind would rouse him; that he must think, coming from men of their *calibre*, they were highly mischievous.
>
> *Burke. Appeal from the New to the Old Whigs.*

Caliber, or Caliper, properly denotes the diameter of any body; thus we say, two columns of the same caliber; the caliber of a bullet, &c.

Caliber Compasses, Caliper Compasses, or Callipers, a sort of compasses made with arched legs, to take the diameter of round or swelling bodies. Caliber compasses are chiefly used by gunners, for taking the diameters of the parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular; and move on an arch of brass, whereon is marked the inches and half inches, to show how far the points of the compasses are opened asunder. The gaugers, also, sometimes use calibers, to embrace the two heads of any cask, in order to find its length. The calibers used by carpenters and joiners, are a piece of board, notched triangular wise in the middle, for taking measures.

Callipers, Gunner's, are instruments in which a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, or four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter, or vice versa. The gunner's callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: the length from the centre of the joint is between six inches and a foot, and the breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of salient and entering angles. The most complete and best sort of callipers, however, usually contain the following articles, viz. first, the measure of convex diameters in inches, &c; second, of concave diameters; third, the weight of iron shot of given diameters; fourth, the weight of iron shot for given gun bores; fifth, the degrees of a semicircle; sixth, the proportion of troy and avoirdupois weight; seventh, the proportion of English and French feet and pounds weight; eighth, factors used in circular and spherical figures; ninth, tables of the specific gravities and weight of bodies; tenth, tables of the quantity of powder necessary for the proof and service of brass and iron guns; eleventh, rules for computing the number of shot or shells in a complete pile; twelfth, rules for the fall or descent of heavy bodies; thirteenth, rules for the raising of water; fourteenth, rules for firing artillery and mortars; fifteenth, a line of inches; sixteenth, logarithmetic scales of numbers, sines, versed sines, and tangents; seventeenth, a sectoral line of equal parts, or the line of lines; eighteenth, a sectoral line of planes and superficies; and, nineteenth, a sectoral line of solids. See Compasses.

CAL'ICE, *n. s.* Lat. *calix*. A cup; a chalice.

> There is a natural analogy between the ablution of the body and the purification of the soul; between eating the holy bread and drinking the sacred *calice*, and a participation of the body and blood of Christ.
>
> *Taylor.*

CALICHON, an ancient instrument of the lute kind, mounted with five strings, tuned to the following ascending intervals: viz. G, first line bass, C F A and D following.

CAL'ICO, } Fr. *calicut*. A kind
Cal'ico-printer. } of cotton cloth, brought
from Calicut, in Malabar. This cloth is decorated with various colors, forms, and figures, by a process of painting.

heads of any cask, in order to find its length. The calibers used by carpenters and joiners, are a piece of board, notched triangular wise in the middle, for taking measures.

Callipers, Gunner's, are instruments in which a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, or four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter, or vice versa. The gunner's callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: the length from the centre of the joint is between six inches and a foot, and the breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of salient and entering angles. The most complete and best sort of callipers, however, usually contain the following articles, viz. first, the measure of convex diameters in inches, &c; second, of concave diameters; third, the weight of iron shot of given diameters; fourth, the weight of iron shot for given gun bores; fifth, the degrees of a semicircle; sixth, the proportion of troy and avoirdupois weight; seventh, the proportion of English and French feet and pounds weight; eighth, factors used in circular and spherical figures; ninth, tables of the specific gravities and weight of bodies; tenth, tables of the quantity of powder necessary for the proof and service of brass and iron guns; eleventh, rules for computing the number of shot or shells in a complete pile; twelfth, rules for the fall or descent of heavy bodies; thirteenth, rules for the raising of water; fourteenth, rules for firing artillery and mortars; fifteenth, a line of inches; sixteenth, logarithmetic scales of numbers, sines, versed sines, and tangents; seventeenth, a sectoral line of equal parts, or the line of lines; eighteenth, a sectoral line of planes and superficies; and, nineteenth, a sectoral line of solids. See Compasses.

CAL'ICE, *n. s.* Lat. *calix*. A cup; a chalice.

There is a natural analogy between the ablution of the body and the purification of the soul; between eating the holy bread and drinking the sacred chalice, and a participation of the body and blood of Christ. *Taylor.*

CALICHON, an ancient instrument of the lute kind, mounted with five strings, tuned to the following ascending intervals: viz. G, first line bass, C F A and D following.

CAL'ICO, } Fr. *calicut*. A kind
Cal'ico-printer. } of cotton cloth, brought from Calicut, in Malabar. This cloth is decoated with various colors, forms, and figures, by a process of painting.

If thou but please to walk into the Pawn
To buy thee cambrick, *calico*, or lawn,
If thou the whiteness of the same wouldst prove
From thy far whiter hand pluck off thy glove;
And those which by as the beholders stand,
Will take thy hand for lawn, lawn for thy hand.
Drayton. Edward IV. to Mrs. Shore.

I wear the hooped petticoat, and am all in *calicoes* what the finest are in silks. It is a dreadful thing to be poor and proud. *Spectator*, No. 292.

As, suppose an ingenious gentleman should write a poem of advice to a *callico-printer*: do you think there is a girl in England, that would wear any thing but the taking of Lisle, or the battle of Oudenarde? They would certainly be all the fashion, till the heroes abroad had cut out some more patterns. I should fancy small skirmishes might do for under petticoats, provided they had a siege for the upper. *Tatler*, No. 3.

Calico, a species of cloth of cotton thread, manufactured, formerly, at Calicut in the East Indies; but we have now in this country established manufactories which equal those in the east. It is said that in this business, and in the printing of calicoes, there are 250,000 persons employed.

CALICUT, or Calicodu, a town and district extending along the coast of Malabar, between the parallels of 10° and 12° N. lat., one of the principal residences of the Nairs, the Calicut rajah, or Zamorin of the Europeans, being one of their chiefs. He is called by his own caste the Tamuri rajah. According to Dr. Buchanan, the origin of the name of this town and district is traced to Cheruman Permal, a usurper who lived 1000 years since, and who, having divided Malabar amongst his nobles, had no principality to bestow on the ancestor of the Tamuri (Zamorin). He therefore gave that chief his sword, with all the territory, in which a cock crowing at a small temple here could be heard; hence these, his original dominions of the Tamuri, were called Calicodu, or cock crowing. The place continued to be the chief residence of the Tamuri Rajah until the Mahommedan invasion, and became a flourishing city, owing to the success that its lords had in war, and the encouragement which they gave to commerce. Tippoo destroyed the town and removed its inhabitants; but, in little more than a year after, the English conquered the province, and the old inhabitants returned with joy and rebuilt the town. See *Buchanan's Journey through Malabar*.

The males of the family of the rajah, are called Tamburans, and the females Tamburetties. Their offspring are generally the children of Namburis, or brahmins of high caste, and sometimes Nairs of the highest rank. Although these females are betrothed in infancy, and marry at the age of ten, they never cohabit with their husbands, which it is said would be esteemed a profanation; but live in the houses of their mothers and brothers, at the expense of the husband, and adopting other men for their companions. No man thus knows his own father. This family pretends to far higher rank than the brahmins. In 1766, according to Mr. Hamilton, 'when Hyder invaded Malabar, the Cochin rajah quietly submitted to pay tribute; while the pride of the Zamorin refused any kind of submission; and, after an unavailing resistance, being made prisoner, set fire to the house in which he was confined, and was burned with it. Several of his personal attendants, who were accidentally excluded when he shut the door, afterwards threw themselves into the flames and perished with their master.' The chiefs of Punatoor, Mannacollatil, Talapuli, Tirumanachery, Agenicutil, and others, were at one time tributary to the Zamorin, and furnished quotas of troops to him in war. He is now entirely a stipendiary of the British government.

The town of Calicut, the capital of the district, stands in lat. 11° 18′ N., long. 75° 50′ E., and contains perhaps, 5,000 houses. It is inhabited chiefly by Mopleys; and is situated on a river navigable by boats 100 miles, by which a great quantity of teak timber is floated down for exports. It also exports areka, cocoa-nuts, pepper, ginger, turmeric, cardemums, coir, and charcoal of the cocoa-nut shell, remarkable for the intense heat it gives; and manufactures piece goods. This port is the principal one of India visited by the Arabs of Muscat. Here Vasco de Gama freighted, in 1498, the first European vessel that ever sailed for the west, with Indian commodities. The sea, however, has long since covered the ancient city, and at very low tides the tops of temples and minarets are said to be seen. The present town stands, low and unsheltered, on the sea shore. The streets are narrow, crowded with people, and dirty. Hyder Ali took the town in 1773, and expelled the merchants and factors, ordering the cocoa-nut trees and sandal wood to be destroyed, and the pepper vines to be rooted out. Tippoo Saib afterwards destroyed it more completely as we have seen. Yet it has since flourished under British domination and protection. It is distant seventy-six miles west of Coimbetore, and ninety-five south-west of Seringapatam. Long. 75° 30′ E., lat 11° 15′ N.

CAL'ID, } See Calx, Calcarious, and
Calid'ity. } Calcine.

Ice will dissolve in any way of heat; for it will dissolve with fire, it will colliquate in water, or warm oil; nor doth it only submit into an actual heat, but not endure the potential *calidity* of many waters. *Browne's Vulgar Errours.*

CALIDÆ Plantæ, from calor, heat; plants that are natives of warm climates; such as those of the East Indies, South America, &c. These plants, says Linnæus, will bear a degree of heat which is 40°, on a scale in which the freezing point is 0, and 100 the heat of boiling water. In the tenth degree of cold they cease to grow, lose their leaves, become barren, and perish.

CALIDRIS, in ornithology, a species of scolopax; the red shank of Latham, totanuss of Brisson, and rotbren of Frisch. The bill is straight and red; legs scarlet, secondary quill-feathers white. Inhabits England and America.

CALIDUCT, in antiquity, a kind of pipe, disposed along the walls of houses or apartments, for conveying heat to several remote parts of the house from one common furnace.

CALIDUS, in entomology, a species of cimex, of a fuscous color above, and testaceous beneath; antennæ black. Found in Africa.

CA'LIF, *n. s.* } Arab. *khalifa*; an heir or
Ca'liph. } successor. A title assumed by the successors of Mahomet among the Saracens, who were vested with absolute power in affairs both religious and civil. Thomson says, it signifies a vicar, a lieutenant, one who holds the place of Mahomet.

Calif. See Caliph

CALIFORNIA, a considerable peninsula on the Pacific Ocean, united on the north to the continent of North America, from which the other part is separated by a narrow sea, called the Gulf of California, and bounded on the south and west by the Pacific Ocean, near 300 leagues in length, and in different places ten, twenty, thirty, and forty leagues wide. It includes a superficial area of above 9000 leagues. This peninsula is said to have been discovered by Sir Francis Drake, and by him called New Albion; and the Gulf of California has been sometimes called the Vermilion Sea, Purple Sea, and Red Sea. In a peninsula of so vast an extent, which reaches nearly from the 23rd to the 45th degree of latitude, the soil and climate must naturally be found to vary. Some parts are continually covered with flowers, while others are inhospitable deserts. According to father Bergert de Schelestat, it is nothing but a chain of barren rocks, covered with briars, without water, without wood, thinly inhabited, and incapable of culture; only the sea-coasts having been discovered till 1788. The heat would be insupportable, if not moderated in the afternoon by the east wind, which blows but seldom, or by the south, which is there more frequent. It rarely rains, and then only in small quantities. The soil is naked rock, or covered with pebbles, fertile in some few places which are watered. It seems to have been produced by a volcano or an earthquake; few fruit trees are found, some forest trees and underwood, towards the south, are all that offer; Indian figs grow wild. Such was the account given; but later observations and discoveries have explored places, particularly in the northern division of this peninsula, where the soil is excellent, and capable of culture; and it is reported, that vines grow naturally on the mountains; that the Jesuits, when they resided there, made wine enough to serve for the consumption of Mexico, of an excellent quality, and in its taste approaching to that of Madeira. Here also grain of every kind is said to flourish well: together with all the roots and fruits of the tropics and such as have been imported for Spain. Fish, game, hares, and rabbits, are very common, and the most enchanting birds. Small gray well flavored partridges feed in companies of three or four hundred in the thickets. In the forests are found gigantic stags, in flocks of forty or fifty at a time. They are brown, with large branches nearly four feet and a-half long, and considered among the most beautiful animals of America. Sebastian Viscaino asserts that he saw some whose branches were nearly nine feet in length. They are very fleet, and can scarcely be taken, except by artifice. Perouse saw them taken in this way:—A stag's head was fixed with its long branches upon an Indian's head, who, armed with a bow and arrows, crept on all fours among the brushwood and long grass, imitating the motion of a stag when feeding. He thus drew around him the unsuspecting herd, and then shot among them with fine effect.

Latterly horses, cattle, sheep, and other domestic animals, have greatly increased here. The coasts furnish great quantities of fish; and in the southern part of the peninsula, the pearl oyster has been an article of flourishing commerce to the colonists. It seems also, from M. Humboldt, that the Indian population had considerably increased in California just before his visit. He says it had more than doubled within the twelve preceding years. Here are eighteeen Spanish missions, founded between the years 1769 and 1798, and containing together a population of from 15 to 17,000 souls. The residence of the governor of the Californias is at Monterey. He has a salary of 4000 piasters; but his authority is not allowed to interfere with the affairs of the missions; except to grant assistance when they require it. His real subjects, therefore, are only about 400 military, distributed in the different presidios, and which keep in subjection about 50,000 wandering Indians. Every parish is governed by two missionaries, whose authority over the converted Indians is absolute; and the domestic economy of each mission differs little from that of a West India plantation. 'The men and women,' according to Perouse, 'are assembled by the sound of a bell; one of the priests conducts them to their work, to church, and to all their other exercises.' Pearl oysters are found on the coast of Old California, and have been, during two centuries, a great inducement to adventurers to visit that barren region. The oysters are most abundant in the southern part, particularly round the islands of Santa Cruz, San Josef, and the bay of Ceralvo. They lie in great numbers on the banks which are called hostias, in three or four fathoms water; and may be seen as plainly as if on the surface of the water. The pearls are large and beautiful, but of an irregular figure; but this fishery has of late years much declined.

The native tribes that inhabit the country acknowledge few regular chiefs. Each father is a prince in his own family, but his power ceases when the children are able to provide for themselves. Each tribe has, nevertheless, sometimes persons appointed, who call assemblies to divide the productions of the earth, regulate the fisheries, and to march at their head, if engaged in war. They owe their rank to the choice of their companions, but they are agents only, not princes. The shade of a tree serves them as a retreat during the day, and in the night they retire to their huts, built on piles at the side of rivers or ponds. Want of provision obliges them often to change their abode, and in severe winters they retire into caves. A girdle and piece of linen, which passes round the body, some ornaments for the head, and a chain of pearls, serve them for dress and finery; some insert colored feathers in holes, which they make in their ears and nostrils; some bind their forehead with bands, like net-work, with which too they cover their arms, adorned with chains of pearls like bracelets. Those who live towards the north, where they have no pearls, dress their heads with shells. The women commonly wear a species of long robe, made of the leaves of palms; some wear nothing but a girdle. These palm-leaves are woven with art, and dyed of different colors; and of them they make baskets, which hold their roots and provisions.

CALIFORNIA, THE GULF OF, SEA OF CORTES, or VERMILION SEA, formed by the peninsula of

as been an article of flourishing commerce to
he colonists. It seems also, from M. Humboldt,
hat the Indian population had considerably in-
reased in California just before his visit. He
ys it had more than doubled within the twelve
receding years. Here are eighteen Spanish
issions, founded between the years 1769 and
798, and containing together a population of from
5 to 17,000 souls. The residence of the governor
the Californias is at Monterey. He has a
lary of 4000 piasters; but his authority is not
lowed to interfere with the affairs of the mis-
ons; except to grant assistance when they
quire it. His real subjects, therefore, are only
out 400 military, distributed in the different
esidios, and which keep in subjection about
,000 wandering Indians. Every parish is
verned by two missionaries, whose authority
er the converted Indians is absolute; and the
mestic economy of each mission differs little
om that of a West India plantation. 'The
en and women,' according to Perouse, 'are
sembled by the sound of a bell; one of the
iests conducts them to their work, to church,
d to all their other exercises.' Pearl oysters are
und on the coast of Old California, and have
en, during two centuries, a great inducement
adventurers to visit that barren region. The
sters are most abundant in the southern part,
rticularly round the islands of Santa Cruz, San
sef, and the bay of Ceralvo. They lie in great
mbers on the banks which are called hostias,
three or four fathoms water; and may be seen
plainly as if on the surface of the water. The
arls are large and beautiful, but of an irregular
ure; but this fishery has of late years much
clined.

ALIFORNIA, THE GULF OF, SEA OF CORTES,
ERMILION SEA, formed by the peninsula of

California on the west, and the continent on the east, is 300 leagues long, and fifty to twenty broad. The chief knowledge we have of it is, that the east coast is high and broken, lined with shoals, to the latitude of 27½°. The only places on the coast (the intendance of Sonoro) are the port of Guitivas, at the mouth of the considerable river Mayo; and that of Guayma at the mouth of the Yaqui. This last is surrounded by elevated hills, and before the entrance is Pelican Island, which is left on the right hand in entering. Ships anchor in five fathoms. The small Spanish village is ten miles up the river. The Colorado, a considerable river, falls into the head of this gulf. The bay of Monterey, the best on the coast of New California, is very indifferent; it is limited by Point Pinos (fir tree) on the south, and point Anno Nueva on the north, distant seven leagues. The whole is bordered by a sandy beach, but entirely exposed, except round Point Pinos, where is a cove, in which a few ships may lie, and this is properly the port of Monterey. The river of that name is an insignificant stream, four leagues north-east of the bay. San Francisco, the most northern of the ports of the Spanish missions, is an excellent harbour, entirely between two low points which expand into a noble basin. On the south shore is the Presidio, and a fort garrisoned by thirty-five men, and a lieutenant of artillery. Sir Francis Drake's Bay is four leagues north of San Francisco, open to the south and south-east, but affording good anchorage on the south shore. It receives a river, whose mouth is crossed by a bar, with a surf that renders its entrance dangerous. Port de la Podega is seven leagues north of Sir Francis Drake's Bay. Cape Mendocino is a promontory, with two elevated points, ten miles asunder, the southernmost resembling Dunnose, on the Isle of Wight. Twenty leagues farther north is Port Trinidad, an open bay, but which receives a river that may be entered by boats, and wood and water are abundant. Cape Blanco, named Cape Orford by Vancouver, is a low point, covered to the water's edge with wood.

CALIGÆ, in Roman antiquity, soldiers shoes, made like sandals, without upper leather to cover the superior part of the foot, though otherwise reaching to the middle of the leg, and fastened with thongs. The sole of the caliga was of wood, like the sabot of the French peasants, and its bottom stuck full of nails. From these caligæ the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a soldier. According to Du Cange, a sort of caligæ was also worn by monks and bishops, when they celebrated mass pontifically.

CALIGATI, an appellation applied by some ancient writers to the common soldiers in the Roman armies, from the caligæ which they wore.

CALIGA'TION, *n.* }
CALIG'INOUS, *adj.* } Lat. *caligo*, darkness, obscurity, cloudiness; dim.
CALIG'INOUSNESS, *n.* }

Instead of a diminution, or imperfect vision, in the mole, we affirm an abolition, or total privation; instead of *caligation* or dimness, we conclude a cecity or blindness. *Brown.*

CALIGO, or CALIGATIO, in medicine, cloudiness, dimness, or suffusion of sight, caused by the interposition of some opaque substance between the light and the optic nerve. The species of caligo are distinguished according to the situation of the interposed body: thus caligo lentis, caligo corneæ, caligo pupillæ, caligo humorum, and caligo palpebrarum.

CAL'IGRAPHY, or }
CAL'LIGRAPHY, *n.* } From καλος, beautiful, and γραφω, to grave or write. Beautiful writing. See CALLIGRAPHY.
CAL'LIGRAPHIC. }

> This language is incapable of *caligraphy*. *Prideaux.*

> The minutes of acts, &c. were always taken in a kind of cypher, or short-hand; such as the notes of Tyro in Gruter: by which means, the notaries were enabled to keep pace with a speaker, or person who dictated. These notes, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. and these were called *calligraphy*. *Dr. A. Rees.*

CALIGULA, the Roman emperor and tyrant, began his reign A. D. 37, with every promising appearance of becoming the real father of his people; but at the end of eight months he was seized with a fever, which, it is thought, left a frenzy on his mind: for his disposition totally changed, and he committed the most atrocious acts of impiety, cruelty, and folly; such as proclaiming his horse consul, feeding it at his table, introducing it to the temple in the vestments of the priests of Jupiter, &c. and causing sacrifices to be offered to himself, his wife, and the horse. After having murdered many of his subjects with his own hands, and caused others to be put to death without any just cause, he was assassinated by a tribune of the people as he came out of the amphitheatre, A. D. 41. in the twenty-ninth year of his age, and the fourth of his reign.—See ROME, HISTORY OF.

CALIN, a compound metal, whereof the Chinese make tea canisters, and the like. The ingredients seem to be lead and tin.

CALIPH. Arab. khalifa, an heir or successor. A title assumed by the successors of Mahomet among the Saracens, who were vested with absolute power in affairs both religious and civil. See KHALIF.

CALIPPIC PERIOD, in chronology, a series of seventy-six years, perpetually recurring, at every repetition of which it was supposed by its inventor Calippus, an Athenian, the mean, new, and full moons, would return to the same day and hour of the solar year. Meton, 100 years before, had invented the period or cycle, of nineteen years; assuming the quantity of the solar year 365*d.* 6*h.* 18′ 56″ 50^{3} 31^{4} 34^{5}; and the lunar month, 29*d.* 12*h.* 45′ 47″ 26^{3} 48^{4} 30^{5}: but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by four, and thence arose a period of seventy-six years, called the Calippic. The Calippic period, therefore, contains 27,559 days: and since the lunar cycle contains 235 lunations, and the Calippic period is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 4,384th of the Julian period It is demonstrated, however, that the Calippic period itself is not accurate; that is does not bring the new and full moons precisely to their places: 8*h*. 5' 52" 60'" being the excess of 940 lunations above seventy-six solar years; but brings them too late, by a whole day in 225 years.

CALISTE, in conchology, a species of Venus, set with transverse acute striæ, membraneous in front, the anterior slope short, and the posterior aperture obscure. Found on the shores of the Red Sea.

CALIX, or CALYX. See BOTANY.

CALIXTINS, a name given to those, among the Lutherans, who follow the sentiments of Calixtus. See CALIXTUS. Also a sect in Bohemia, derived from the Hussites, about the middle of the fifteenth century, who asserted the use of the cup, as essential to the eucharist. They are not ranked by Romanists in the list of heretics, as in the main they still adhered to the doctrine of Rome. The reformation they aimed at extended only to four articles: 1. To restore the cup to the laity. 2. To subject criminal clergymen to punishment by the civil magistrate. 3. To strip the clergy of their lands, lordships, and all temporal jurisdictions. 4. To grant liberty to all capable priests to preach the word of God.

CALIXTUS (George), a celebrated divine, and professor at Helmstadt, in the Duchy of Brunswick, who died in 1656. He opposed the opinion of St. Augustin, on predestination, and endeavoured to form a union among the various members of the Romish, Lutheran, and reformed churches.

CALK', *v.*
CALK'ER, *n.*
CALK'ING,
CALK'ING-IRON.

Fr. *calage*, oakum or tow; or Sax. *cale*, the keel of a ship; but Swed. *kalfatra*; Dan. *kalfatre*; Bel. *kalfaten*; Fr. *calfater*; Hind. *kalapatta*; Ara. *kalafa*, *kilafat*; καλαφατης, are used in the sense of our word. To stop the seams of a ship; to cram or stuff in materials to keep out the water from leaks and chasms, made by violence or accident. Calking is used in a more general sense: Chambers says, it is a term in painting, used where the backside is covered with black lead, or red chalk, and the lines traced through on a waxed plate, wall, or other matter, by passing lightly over each stroke of the design with a point, which leaves an impression of the color on the plate or wall.

Thy riches, and thy fairs, thy merchandise, thy mariners, and thy pilots, thy *calkers*, and the occupiers of thy merchandise, and all thy men of war, that are in thee, and in all thy company which is in the midst of thee, shall fall into the midst of the seas in the days of thy ruin.

Ezekiel xxvii. 27.

There is a great errour committed in the manner of *calking* his majesty's ships; which, being done with rotten oakum, is the cause they are leaky.

Raleigh's Essays.

So here some pick out bullets from the side;
Some drive old oakum through each seam and rift;
Their left hand does the *calking* iron guide,
The rattling mallet with the right they lift. *Dryden.*

CALKING, a term in painting. See the preceding article.

CALKING, in maritime affairs. See CAULKING.

CALKINS, the prominent parts at the extremities of a horse-shoe, bent downwards, and forged to a sort of point. They are apt to make horses trip; they also occasion bleymes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas, the great square calkins spoil the foot. Calkins are either single or double, that is, at one end of the shoe, or at both: these last are deemed less hurtful, as the horses can tread more even.

CALL', *v.* & *n.*
CALL'ER, *n.*
CALL'ING, *n.*

Καλεω; Lat. *calo*; Welsh and Arm. *galw*; Goth. *kalla*; Swed. *kala*; Teut. and Belg. *kallen*; Heb. *kol*; Ara. *gal*, the voice. To name; to speak aloud; to invite; to mark, signify, or denote. Its religious sense of divine vocation, (for which see below) has but too often been used lightly, by both religious and irreligious men. As used alone with prepositions annexed, and in all the different shades of its acceptations, it is thus exhibited by Dr. Johnson. We shall, however, a little vary his illustrations.

To name; to denominate.

And God *called* the light day, and the darkness he *called* night. *Genesis* i. 5.

Whilst on her father's knee the damsel played,
Patty he fondly *called* the smiling maid. *Gay.*

And what they *call* the prudent part
Is to wear interest next the heart. *Id.*

To summon, or invite, to or from any place, thing, or person. It is often used with local particles, as *up*, *down*, *in*, *out*, *off*.

Of all the day she saw him not with eye;
She trowed he was in som maladie,
For, for no crie, hire maiden coud him *calle*,
He n'olde answer—for nothing that might falle.
Chaucer's Canterbury Tales.

Wherein his weaker wandering steps to guyde,
An auncient matrone she to her does *call*,
Whose sober lookes her wisdome well descryde
Her name was Mercy; well known over all
To be both gratious and eke liberall. *Spenser.*

Be not amazed; *call* all your senses to you; defend my reputation, or bid farewell to your good life for ever. *Shakspeare.*

Why came not the slave back to me when I *called* him. *Id. King Lear.*

Are you *called* forth from out a world of men,
To slay the innocent? *Id. Richard III*

The soul makes use of her memory, to *call* to mind what she is to treat of. *Duppa's Rules to Devotion.*

Or *call up* him that left half told
The story of Cambuscan bold. *Milton.*

Such fine employments our whole days divide;
The salutations of the morning tide,
Call up the sun; those ended, to the hall
We wait the patron, hear the lawyers bawl. *Dryden.*

Then by consent abstain from further toils,
Call off the dogs, and gather up the spoils. *Addison.*

I am *called off* from public dissertations, by a domestic affair of great importance. *Tatler.*

The passions *call away* the thoughts, with incessant importunity, toward the object that incited them.

Watts.

To call back; to revoke; to retract.

Yet he also is wise, and will bring evil, and will not call back his words, but will arise against the house of the evil doers, and against the help of them that work iniquity. *Isaiah* xxxi. 2.

To call for; to demand; to require; to claim.

Madam, his majesty doth *call for* you,
And *for* your grace, and you, my noble lord.
Shakspeare.

You see how men of merit are sought after; the undeserver may sleep, when the man of action is *called for.* *Id.*

Among them he a spirit of phrensy sent,
Who hurt their minds,
And urged you on, with mad desire,
To *call* in haste *for* their destroyer.
Milton's Sampson Agonistes.

For master, or *for* servant here to *call*,
Was all alike, where only two were all.
Dryden's Fables.

I have been accustomed to entwine
My thoughts with Nature rather in the fields,
Than Art in galleries; though a work divine
Calls for my spirit's homage, yet it yields
Less than it feels, because the weapon which it wields
Is of another temper. *Byron's Childe Harold.*

To call in; to resume money at interest.

Horace describes an old usurer, as so charmed with the pleasures of a country life, that, in order to make a purchase, he called in all his money; but what was the event of it? why, in a very few days after, he put it out again. *Addison's Spectator.*

To call in; to resume any thing that is in other hands.

If clipped money be *called in* all at once, and stopped from passing by weight, I fear it will stop trade. *Locke.*

Neither is any thing more cruel and oppressive in the French government, than their practice of *calling in* their money, after they have sunk it very low, and then coining it anew, at a higher value. *Swift.*

To call in; to summon together; to invite.

The heat is past, follow no farther now;
Call in the powers, good cousin Westmoreland.
Shakspeare.

He fears my subjects loyalty,
And now must *call in* strangers.
Denham's Sophy.

To call over; to read aloud a list or muster-roll.

To call out; to challenge; to summon to fight.

When their sovereign's quarrel *calls* 'em *out*
His foes to mortal combat they defy.
Dryden's Virgil.

The verb used in the neutral sense signifies to stop without intention of staying. This meaning probably arises from the custom of denoting one's presence at the door by a call: but it is now used with *in* improperly. This sense is well enough preserved by the particles *on* or *at*; but is forgotten, and the expression made barbarous by *in*.

To make a short visit.

And, as you go, *call on* my brother Quintus,
And pray him, with the tribunes, to come to me.
Ben Jonson.

He ordered her to *call at* his house once a week, which she did for some time after, when he heard no more of her. *Temple.*

That I might begin as near the fountain-head as possible, I first of all *called in* at St. James's. *Addison's Spectator.*

To call on; to solicit for a favor, or a debt.

I would be loth to pay him before his day; what need I be so forward with him, that *calls* not *on* me! *Shakspeare. Henry IV.*

To call on; to repeat solemnly.

Thrice *call upon* my name; thrice beat your breast;
And hail me thrice to everlasting rest. *Dryden.*

The Athenians, when they lost any men at sea, went to the shores, and, *calling* thrice on their name, raised a cenotaph, or empty monument, to their memories. *Broome on the Odyssey.*

To call upon; to implore; to pray to.

Call upon me in the day of trouble; I will deliver thee, and thou shalt glorify me. *Psalm* i. 15.

The neuter substantive from the verb has also a diversity of acceptations, as will be obvious from the subjoined instances.

A vocal address of summons or invitation.

But death comes not at *call*, justice divine
Mends not her slowest pace for prayers or cries.
Milton.

But would you sing, and rival Orpheus' strain,
The wondering forest soon should dance again;
The moving mountains hear the powerfull *call*,
And headlong streams hang listening in their fall.
Pope.

A requisition authoritative and public.

It may be feared, whether our nobility would contentedly suffer themselves to be always at the *call*, and to stand to the sentence, of a number of mean persons. *Hooker's Preface.*

Divine vocation; summons to true religion.

Yet he at length, time to himself best known,
Remembering Abraham, by some wonderous *call*,
May bring them back repentant and sincere. *Milton.*

A summons from heaven; an impulse.

How justly then will impious mortals fall,
Whose pride would soar to heaven without a *call*!
Roscommon.

Those who to empire by dark paths aspire
Still plead a *call* to what they most desire.
Dryden.

St. Paul himself believed he did well, and that he had a *call* to it, when he persecuted the christians, whom he confidently thought in the wrong: but yet it was he, and not they, who were mistaken. *Locke.*

Authority; command.

Oh, Sir! I wish he were within my *call*, or yours.
Denham.

A demand; a claim.

Dependence is a perpetual *call* upon humanity, and a greater incitement to tenderness and pity, than any other motive whatsoever. *Addison's Spectator.*

An instrument to call birds.

For those birds or beasts were made from such pipes or *calls*, as may express the several tones of those creatures, which are represented.
Wilkins' Mathematical Magic.

Calling; vocation; employment.

Now through the land his cure of souls he stretched,
And like a primitive apostle preached;
Still cheerful, ever constant to his *call*,
By many followed, loved by most admired by all.
Dryden.

A nomination.

Upon the sixteenth was held the sergeants' feast at Ely-place, there being nine serjeants of that *call*.
Bacon.

Calling is applied to vocation; profession; trade.

If God has interwoven such a pleasure with our ordinary *calling*, how much superior must that be, which arises from the survey of a pious life? Surely, as much as Christianity is nobler than a trade.
South.

We find ourselves obliged to go on in honest industry in our *callings*. *Rogers.*

I cannot forbear warning you against endeavouring at wit in your sermons; because many of your *calling* have made themselves ridiculous by attempting it.
Swift.

I left no *calling* for this idle trade,
No duty broke, no father disobeyed. *Pope.*

To proper station or employment.

The Gauls found the Roman senators ready to die with honour in their *callings*.

To class of persons united by the same employment or profession.

It may be a caution to all Christian churches and magistrates, not to impose celibacy on whole *callings*, and great multitudes of men or women, who cannot be supposable to have the gift of continence.
Hammond.

Divine vocation; invitation or impulse to the true religion.

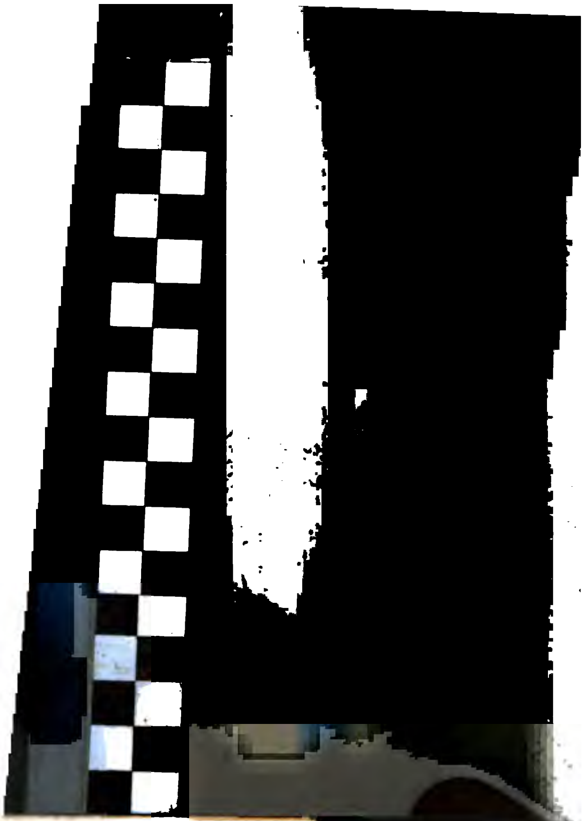
Give all diligence, to make your *calling* and election sure. 2 *Peter*. i. 10.

St. Peter was ignorant of the *calling* of the Gentiles.
Hakewill on Providence.

CALL, among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling time. One method of catching partridges is by the natural call of a hen trained for the purpose, which drawing the cocks to her, they are entangled in a net. Different birds require different calls; but most of them are composed of a pipe or reed, with a little leathern bag, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flageolet. They are played, by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb, to counterfeit the call of the hen quail.

CALL, among sailors, a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in the different employments of the ship.

CALL OF THE HOUSE, in the British Parliament, is the calling over the names of the members, to discover whether there be any in the house not returned by the clerk of the crown; or what members are absent without leave, or just cause. In the former case, every person answers to his



to a recent traveller, for the purpose
charge of any treasure that may be
shore; a circumstance that often hap-
n old mulatto, one of the three or four
e saved, told Mr. Stephenson that he
ing on some timber which had been
rom a ship in the bay, at the time that
: wave of the sea rolled in and buried
, and that he was carried clinging to the
ır to the chapel, a distance of three miles.
s six miles distant from Lima

LA-SUJUNG, or Calla-susung, a town
, in the island of Bouton, seated about a
om the sea, on the top of a small hill sur-
d with cocoa-nut trees.

LLE, in ancient geography, a town of Hi-
pain, seated on an eminence, which hung
he river Durius. It is now called Oporto.

L'LET, *v.* & *n.* Fr. *calotte;* a coif or
erchief for a woman; also a little light cap,
ight-cap worn under a hat. Perhaps the
nguishing badge at one period of lewd and
nous women, for of such persons the word
escriptive. Skinner applies it to an impu-
woman; Dr. Johnson to a trull.

he firste parte of this name we have yfounde:
us ethimologise the secounde:
the firste findir mente, I am right sure,
or *Calot*; for Of, we havin *O*;
d *L* for leude; and *D* for Demenure:
e craft of the enventour ye maie se, lo!
ow one name signifieth personis two,—
colde olde knave, cokcold himself wenying;
nd eke a *calot* of Leude Demyning.

Chaucer's Remedie of Love.

He called her whore: a beggar in his drink
Could not have laid such terms upon his *callet.*

Shakespeare.

Iago. What name fair lady?
Des. Such as, she says, my lord did say I was.
Emil. He called her whore; a beggar in his drink,
Could not have laid such terms upon his *callet.*
Iago. Why did he so?
Des. I do not know, I am sure, I am none such.

Shakespeare. Othello.

CALLEVA, in ancient British geography, a town of the Atrebates; now called Wallingford. See Atrebates.

CALLIAS, the cousin german of Aristides the Just, but of a character the very opposite of that disinterested hero. At the battle of Marathon, Callias being a torch-bearer, and in virtue of his office, having a fillet on his head, one of the Persians took him for a king, and, falling down at his feet, discovered to him a vast quantity of gold hid in a well. Callias not only seized it for his own use, but had the cruelty to kill the poor man, that he might not mention it to others; by which infamous action he entailed on his posterity the name of Laccopluti, or enriched by the well. The only good action recorded of him is his generosity in relieving his brother-in-law Cimon from prison, by paying the heavy fine to which he was so unjustly and ungratefully subjected by the Athenians. See Attica.

CALLIBLEPHARA, from καλλος, beauty, and βλεφαρον, eye-lid; in ancient medical writers, a name given to certain compositions intended to make the eye-lids beautiful.

CALLICARPA. See Johnsonia.

CALLICO. See Calico, and Cotton.

CALLICRATES, an ancient sculptor, who is said to have engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the wing of a fly, and an ant of ivory, in which all the members were distinct. He flourished about A. A. C. 472.

CALLICHTHYS, in ichthyology, a species of silurus, having the second dorsal fin one-rayed; a double row of scales on the sides; cirri four.

CALLIGONUM, in botany, a genus of the digynia order, belonging to the polyandria class of plants; and in the natural method ranking under the twelfth order, holoraceæ. The calyx is pentaphyllous, without petals or styles; the fruit hispid and monospermous. There are three species, natives of Ararat, Barbary, and Russia.

CALLIGRAPHY, the art of small beautiful writing. Callicrates is said to have written an elegant distich on a sesamum seed. Peter Bale, in 1575, wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, inchased in a ring and border of gold, and covered with a crystal, all so accurately written as to be very legible with a magnifying glass.

CALLIMACHUS, a celebrated architect, painter, and sculptor, born at Corinth, who having seen by accident a vessel about which the plant called acanthus had raised its leaves, conceived the idea of forming the Corinthian capital. See Acanthus. He flourished about A. A. C. 540.

Callimachus, a celebrated Greek poet, a native of Cyrene, in Lybia, flourished under Ptolemy Philadelphus, and Ptolemy Euergetes, kings of Egypt, about A. C. 280. He passed, according to Quintilian, for the prince of the Greek elegiac poets. His style is elegant, delicate, and nervous. He wrote a great number of small poems, of which we have only some hymns and epigrams remaining. Catullus has closely imitated him, and translated into Latin verse his small poem on the locks of Berenice. Callimachus was also a grammarian and a learned critic. There is an edition of his remains, by Messrs. Le Fevre, 4to.; and another in 2 vols. 8vo., with notes by Spanheim, Grævius, Bentley, &c. Dr. Tytler of Brechin has translated his poems into English verse.

CALLIMUS, or Calainus, in physiology, a stony substance mentioned by Pliny, found in the cavity of the ætites, or eagle stone. It fills the hollow of the ætites, much as the yoke does the white of an egg. See Ætites.

CALLINICUS of Heliopolis, inventor of a composition to burn in the water, called the Greek fire.

CALLIONYMUS, the dragonet, in ichthyology, a genus of fishes belonging to the order of jugulares. The upper lip is doubled up; the eyes are very near each other; the membrane of the gills has six radii; breathing aperture in the neck; the operculum is shut; the body is naked; and the ventral fins are at a great distance from each other. There are seven species; the prin[illegible]pal are, C. dracunculus, with the first bone of the back fin shorter than its body, which is of a spotted yellow color. It frequents the shores of Genoa and Rome. C. Indicus, has a smooth head, with longitudinal wrinkles; the lower jaw is a little longer than the upper one; the tongue obtuse and emarginated; the apertures of the gills are large: it is of a livid color, and the anus is in the middle of the body. It is a native of Asia. C. lyra, with the first bone of the back fin as long as the body of the animal, and a cirrhus at the anus. It is found as far north as Norway and Spitzbergen, and as far south as the Mediterranean Sea. It is not unfrequent on the Scarborough coast, where it is taken by the hook in thirty or forty fathoms water. It is often found in the stomach of the cod.

CALLIOPE, from καλλος, beauty, and ωψ, voice, in the Pagan mythology, the muse who presides over eloquence and heroic poetry. She was fabled to have a very sweet voice, and was reckoned the first of the nine sisters. Horace styles her Regina:

> Descende cælo, et dic age tibia,
> Regina, longum, Calliope, melos,
> Seu voce nunc mavis acuta,
> Seu fidibus citharave Phœbi.

Her distinguishing office was to record the worthy actions of the living; and, accordingly, she is represented with tablets in her hand.

Calliope, in entomology, a species of papilio, the wings of which are yellow; the anterior pair three streaks; the posterior ones, three bands.

CAL'LIPERS, *n. s.* Of this word I know not the etymology; nor does any thing more probably occur, than that, perhaps, the word is corrupted from *clippers*, instruments with which any thing is clipped, enclosed or embraced. Compasses with bowed shanks.

> *Callipers* measure the distance of any round, cylindrick, conical body; so that when workmen use them, they open the two points to their described width, and turn so much stuff off the intended place, till the two points of the *callipers* fit just over their work. *Moxon's Mechanical Exercises.*

Callipers. See Caliber Compasses.

CALLIPOLIS, in ancient geography, the name of several cities of antiquity, particularly one upon the Hellespont, next the Propontis, and opposite to Lampsacus in Asia; now called Gallipoli.

CALLIPIC Period. See Calippic.

CALLIRRHOE, in ancient geography, called also Enneacrunos, from its nine springs, a fountain not far from Athens, greatly adorned by Pisistratus, where there were several wells, but this was only the running spring. It was also the name of a very fine spring of hot water beyond Jordan, near the Dead Sea, into which it runs.

CALLISIA, in botany, a genus of the monogynia order, in the triandria class of plants; in the natural method of the sixth order, ensatæ: cal. triphyllous; the petals are three; antheræ double; the capsule is bilocular. There is but one species, a native of America and the West Indies.

the infanta of the Nether-
ussels, where he engraved
ouis XIII. made him de-
chelle and Rhé. Having

a Nancy in 1631, he proposed that Callot ld represent the new conquest; but Callot ged to be excused; and some courtiers re- ving to oblige him to do it, he answered, that would sooner cut off his thumb, than any thing against the honor of his prince nd country. This excuse the king accepted; nd said, that the duke of Lorraine was happy in having such faithful and affectionate subjects. Callot followed his business so closely, that, though he died at forty-three years of age, he is said to have left of his own execution 1500 pieces. The following are a few of the principal: 1. The Murder of the Innocents. 2. The Marriage of Cana in Galilee. 3. The Passion of Christ, on twelve very small upright plates; first impressions very scarce. 4. St. John in the island of Patmos. 5. The Temptation of St. Anthony. 6. The Punishments; the execution of several criminals. 7. The Miseries of War; in eighteen small plates. 8. The great Fair of Florence. 9. The little Fair, or Players at Bowls. This is one of the scarcest of Callot's prints; and it is very difficult to meet with a fine impression of it.

CALLIXTUS III. a Spaniard, named Alphonso de Borgia, elected Pope in 1455, and died in 1458, after attempting in vain to stir up the princes of Europe against the Turks. Medals were struck in honor of this pope, bearing, as in the annexed figure, his effigy, and the inscription, CALISTUS III. PONT. MAX.

CALLOSA, in entomology, a small Italian species of apis, the color of which is a dark shining blue, with a white lip, and white callous dots on each side of the thorax, in front of the wings.

CAL'LOUS, *adj.* }
CAL'LOUSNESS, }
CALLOS'ITY. }

Lat. *callus*; Fr. *callosité*. Properly that hardness of the foot induced by walking. Indurated; hardened; inexorable; applied to wounds or the edges of ulcers when in an insensible state; to the mind that is sluggish and misapprehensive; to a hard unfeeling heart, dead to the sympathies and tendernesses of human nature.

Licentiousness has so long passed for sharpness of wit, and greatness of mind, that the conscience is grown *callous*. *L'Estrange*.

The wretch is drenched too deep;
His soul is stupid, and his heart asleep;
Fattened in vice, so *callous* and so gross,
He sins, and sees not, senseless of his loss.
Dryden.

The oftener we use the organs of touching, the more of these scales are formed, and the skin becomes the thicker, and so a *callousness* grows upon it. *Cheyne*.

In progress of time, the ulcers became sinuous and *callous*, with induration of the glands. *Wiseman*.

The surgeon ought to vary the diet of his patient, as he finds the fibres loosen too much, are too flaccid, and produce funguses; or as they harden, and produce *callosities*; in the first case, wine and spirituous liquors are useful, in the last hurtful.
Arbuthnot on Diet

If they let go their hope of everlasting life with willingness, and entertain final perdition with exultation, ought they not to be esteemed destitute of common sense, and abandoned to a *callousness* and numbness of soul. *Bentley.*

CAL'LOW. Sax. calu; Swed. *kahl*, *skallig*, from Lat. *calvus*, unfledged; naked. By Lye it is applied to the smoothness and nakedness of unfledged birds; by Drayton to the smoothness or softness of the down; and by Fletcher (Met.) to a newly fledged wing. The 'soft and callow down' of the elegant Drayton, is clearly in allusion to the natural state of the wing in young birds; in which at the same time the down is beautifully 'soft.'

And through his soft and *callow* down doth flow
As loth so soon his presence to forego.
The Owl.

Thy love no time began, no time decays,
But still increaseth with decreasing days:
Where then may we begin, where may we end thy praise?
My *callow* wing, that newly left the nest,
How can it make so high a towering flight?
O depth without a depth! in humble breast,
With praises I admire so wondrous height.
Fletcher's Purple Island, can. 1.

Bursting with kindly rapture, forth disclosed
Their *callow* young. *Milton.*

Then as an eagle, who with pious care
Was beating widely on the wing for prey,
To her now silent airy does repair,
And finds her *callow* infants forced away.
Dryden.

How in small flights they know to try their young,
And teach the *callow* child her parent's song. *Prior.*

So speeds the wily fox, all armed with fear,
Who lately filched the turkey's *callow* care. *Gay.*

And oft the wily dwarf in ambush lay,
And often made the *callow* young his prey,
With slaughtered victims heaped his board, and smiled
To avenge the parents' trespass on the child. *Beattie.*

CALLUS, or CALLOSITY, in a general sense, is any cutaneous, corneous, or osseous hardness, natural or preternatural; but most frequently it signifies the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, in the situation in which they are replaced by the surgeon. A callus, in this sense, is originally a sort of jelly, or liquid viscous matter, that issues from the small arteries and bony fibres of the divided parts, and fills up the cavities between them. It first appears of a cartilaginous substance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence with this part, than with those which were never broken. It is not always in the power of surgeons to restrain or command its growth; for sometimes a broken bone, for want of due action in its vessels, will remain several months disunited; and, at other times, the callus becomes so exuberant as to cause an unsightly enlargement of the bone, around the broken extremities. That preternatural hard and thickened state of the skin which constitutes the disease named a corn, is also termed callus, and to the lamina of horny cuticle which forms on the hands of hard-working people, the same name is applied. Surgeons apply the term callus to the edges of old ulcers, when they become thickened and insensible. This kind of induration is unfavorable to a cure, and should be removed by the knife or caustic, if it cannot be softened by emollient poultices, &c.

CALM', *v. adj.* & *n.*
CALM'LY,
CALM'NESS,
CALMY', *adj.*

Fr. *calme*; Ital. Sp. Port. *calma*, χαλαω; It. *calo*, signify to lower; allay; abate; but possibly Lat. *quietum*, *quietillum*, *quillum*, *tranquillum*, may have produced calm: quiet; still; easy; peaceable; fair; gentle; unmoved. To calm and to becalm differ in some degree; to calm is to stop motion, and to becalm is to withhold from motion.

So shall the sea be *calm* unto us. *Jonah.*

And now they nigh approached to the sted,
Where as those mermaides dwelt: it was a still
And *calmy* bay, on one side sheltered
With the broad shadow of an hoary hill.
Faerie Queene.

It seemeth most agreeable to reason, that the waters rather stood in a quiet *calm*, than that they moved with any raging or overbearing violence.
Raleigh.

Sir, 'tis fit
You have strong party, or defend yourself
By *calmness*, or by absence, all's in anger.
Shakspeare.

I see thou art implacable, more deaf
To prayers than winds or seas; yet winds to seas
Are reconciled at length, and sea to shore;
Thy anger unappeasable still rages
Eternal tempest, never to be *calmed*. *Milton.*

Angling was, after tedious study, a rest to his mind, a cheerer of his spirits, a diverter of sadness, a *calmer* of unquiet thoughts, a moderator of passions, a procurer of contentedness. *Walton.*

But against that thou sittest afloat,
Like Venus in her pearly boat;
The halcyons *calming* all that's nigh,
Betwixt the air and water fly. *Marvell.*

O help! O help! I see it faint
And dye as *calmly* as a saint. *Id*

Much him the honour of his ancient race
Inspired, nor would he his own deeds deface,
And secret joy in his *calm* soul does rise,
That Monk looks on to see how Douglas dies. *Id.*

Great and strange *calms* usually portend the most violent storms; and therefore, since storms and *calms* do always follow one another, certainly, of the two, it is much more eligible to have the storm first, and the *calm* afterwards: since a *calm* before a storm is commonly a peace of a man's own making; but a *calm* after a storm, a peace of God's. *South.*

His curled brows
Frown on the gentle stream, which *calmly* flows.
Denham.

I will bear it
With all the tender sufferance of a friend,
As *calmly* as the wounded patient bears
The artist's hand that ministers his cure.
Otway's Orphan.

I beg the grace,
You would lay by those terrours of your face;
Till *calmness* to your eyes you first restore,
I am afraid, and I can beg no more. *Dryden.*

Jesus, whose bare word checked the sea, as much exerts himself in silencing the tempests, and *calming* the intestine storms, within our breasts.
Decay of Piety.

The queen her speech with *calm* attention hears,
Her eyes restrain the silver-streaming tears. *Pope.*

He willed to stay,
The sacred rites and hecatombs to pay,
And *calm* Minerva's wrath. *Id.*

Religion's cheerful flame her bosom warms,
Calms all her hours, and brightens all her charms. *Gay.*

Gradual sinks the breeze
Into a perfect *calm*; that not a breath
Is heard to quiver through the closing woods,
Or rustling turn the many-twinkling leaves
Of aspin tall. *Thomson's Seasons.*

Affliction is the wholesome soil of virtue,
Where patience, honour, sweet humanity,
Calm fortitude take root, and strongly flourish.
Mallet and Thomson's Alfred.

Hail awful scenes, that *calm* the troubled breast,
And woo the weary to profound repose;
Can passion's wildest uproar lay to rest,
And whisper comfort to the man of woes? *Beattie.*

Clear as its current, glide the sauntering hours
With a *calm* languor, which, though to the eye
Idlesse it seem, hath its morality. *Byron.*

Calm, the state of rest which appears in the air and sea when there is no wind stirring. A calm is more dreaded by a sea-faring man than a storm, if he has a strong ship and sea room; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir. Two opposite winds will sometimes produce a calm. This frequently occurs in the Gulf of Mexico, at no great distance from the shore, where some gust or land wind will so poise the general easterly wind, as to produce a perfect calm. Calms are never so great on the Ocean as on the Mediterranean, as the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm is sometimes so dead, that the water is as clear as a looking-glass; but such calms are almost constant presages of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake. It is not uncommon for vessels to be becalmed, in the road of the constant Levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche toward the main, and Cape Antonia in Cuba, the sea is narrow, and there is often a calm produced by some gust of a land wind that poises the Levantine wind, and renders the whole perfectly still for two or three days. In this case the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havannah; but if otherwise, it is often a fortnight or three weeks' sail, the ship being embayed in the Gulf of Mexico. When the weather is perfectly calm, the sailors try which way the current sets, by sending out a boat, which will ride motionless though there is no bottom to be found, as well as if secured by the strongest anchor. Their method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about 200 fathoms; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as possible.

Calm Latitudes, in sea language, are situated in the Atlantic Ocean, between the tropic of Cancer and the latitude of 29° north, or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

CALMAR, a sea-port of Sweden, in the province of Smaland, 150 miles south-west of Stockholm, and forty from Carlscroon. It is divided into two towns, the old and the new. The new town is built a little way from the other, and is large and handsome.

CALMET (Augustine), one of the most learned and laborious writers of the eighteenth century, was born at Mesnil le Horgue, in France, in 1672, and took the habit of the Benedictines in 1688. Having passed through the usual course of philosophy and theology, he was employed in teaching the younger part of the community, till, in 1704, he settled as sub-prior in the abbey of Munster, in Alsace, where he presided over an academy of eight or ten monks devoted to the study of the Scriptures. There he composed his commentaries on the Scriptures, published in French from 1707 to 1716. In 1718 he was appointed to the abbacy of St. Leopold in Nancy; and in 1728 he was elected abbot of Senones. The title of a bishop in partibus was offered him, but he declined accepting it. He wrote, 1. Commentaire Litteral sur tous les Livres de l'Ancien et du Nouveau Testament, 23 vols. 4to. 1707-1716, reprinted in 26 vols. 4to., and also in 9 vols. fol.; abridged in 14 vols. 4to. by Rondet, and a new edition of the abridgment in 17 vols. 4to. Avignon, 1767-73. 2. The Dissertations and Prefaces, published separately, 2 vols. 4to. Paris, 1720. 3. Histoire de l'Ancien et du Nouveau Testament, intended as an introduction to Fleury's Ecclesiastical History, 2 and 4 vols. 4to., and 5 and 7 vols. 12mo, 4. Dictionnaire Historique, Critique, et Chronologique, de la Bible, 4 vols. fol. Paris, 1730, translated into English by Samuel D'Oyly, 3 vols. fol. London, 1732, and a new edition in 4to. 1793, &c. 5. Histoire Ecclesiastique et Civile de la Lorraine, 3 vols. fol. reprinted in 5 vols. fol. 1745. 6. Bibliotheque des Ecrivains de Lorraine, fol. 1751. 7. Histoire Universelle Sacrée et Profane. 15 vols. 4to. &c.

CALMUCKS. See Kalmucks.

CALNE, a town of Wiltshire, seated on the river of the same name. It had a palace of the West Saxon kings. Its chief manufacture is cloth. It sends one member to parliament; and lies twelve miles west of Marlborough, and eighty-eight west of London.

CALNEA, in ancient geography, a city in the land of Shinar, built by Nimrod, and the last city mentioned (Gen. x. 10.) as belonging to his kingdom. It is believed to be the same with Calno mentioned in Isaiah x. 9, and with Canneh in Ezekiel xxvii. 23. It is observed that it must have been situated in Mesopotamia, since these prophets join it with Haran, Eden, Assyria, and Chilmad, which carried on a trade with Tyre. It is said by Chaldee interpreters, as well as by Eusebius and Jerome, to be the same with Ctesiphon, upon the Tigris, about three miles distant from Seleucia, and that for some time it was the capital city of the Parthians.

CALODENDRUM, in botany, a genus of the class pentandria, order digynia. The essential characters are CAL. five-parted: COR. petals five; nectaries five: PER. capsule five-celled and five-angled; but the corolla, nectary, and stamens so often differ in the number of their parts, that the capsule may be said to be the only essential. There is but one species: a native of the Cape.

ALOGERI, καλογεροι, in church history, monks of the Greek church, divided into three degrees; viz. the archari, or novices; the microchemi, or the ordinary professed; and the megalochemi, or more perfect; they are likewise divided into cœnobites, anchorites, and recluses. The cœnobites are employed in reciting their offices from midnight to sun-set; they are obliged to make three genuflexions at the door of the choir, and returning, to bow to the right and to the left, to their brethren. The anchorites retire from the world, and live in hermitages in the neighbourhood of the monasteries; they cultivate a little spot of ground, and never go out but on Sundays and holidays, to perform their devotions at the next monastery. The recluses shut themselves up in grottoes and caverns on the tops of mountains, which they never leave, abandoning themselves entirely to Providence: they live on the alms sent them by the neighbouring monasteries. Some reckon the Caloyers a branch of the Calogeri.

CALOMEL, chloride of mercury, frequently called mild muriate, or dulcified sublimate of mercury.

CALOPHYLLUM, in botany, a genus of the monogynia order, and polyandria class of plants: COR. tetrapetalous: CAL. tetraphyllous and colored; the fruit a globose plum. There are two species, both lofty trees, indigenous to India; from one of which, C. inophyllum, upon incision of its bark, exudes the resin called tacamahac.

CALOPUS, in zoology, a genus of the class insecta, order coleoptera. Antennas filiform; feelers four, the fore-ones clavate, the hind-ones filiform: thorax gibbous; wing-cases linear. Three species; two European, one American.

CALORIMETER, an instrument first contrived by Lavoisier and Laplace, to measure the heat given out by a body in cooling. It consists of three vessels, placed one within the other, so as to leave two cavities between them; a frame of iron net-work being suspended in the middle of the innermost vessel, to hold the heated body. The two exterior concentric interstices are filled with bruised ice, by the fusion of which the heat given out by the central hot body is measured. The water runs off through the bottom, which terminates in the shape of a funnel, with a stopcock.

CALOTE, a species of skull-cap worn under the hat by officers and soldiers of the French cavalry, and which is proof against a sabre or a sword. Calotes are usually made of iron, or dressed leather. Those delivered out to the troops are made of iron.

CALOTE, a term used in the French service for the lieutenant's court, at which the first lieutenant of the regiment, for the time being, always presided. It took cognizance, as a court of honor, of all disputes in which the laws of honor or of good breeding had been violated. Our regimental committees resemble the calote, especially with regard to the expulsion of an officer, or the sending of him to Coventry.

CALOTES, in zoology, a species of lacerta, with a round long tail; the fore part of the back, and hinder part of the head being dentated Found in the island of Ceylon.

CALOTTE', *n. s.* French. See CALLET.

CALO'YERS, *n. s.* Καλος. Monks of the Greek church.

> Temperate as *caloyers* in their secret cells.
>
> *Madden on Boulter.*

CALOYERS are of the order of St. Basil. A numerous body of them live on Mount Athos, and never marry, though others of that church do. They abstain from flesh, and fare very hardly, their ordinary meals being olives pickled when they are ripe. They are about 6000 in all, and inhabit several parts of the mountain. They are so respected that the Turks themselves will often send them alms. These monks are not idle, but labor with the axe, spade, and sickle, dressing themselves like hermits. Formerly they had fine Greek MSS., but they are now become so illiterate, that they can scarcely read or write. They live to a great age. See CALOGERI.

CALPE, a mountain of Andalusia in Spain; at the foot of which, towards the sea, stands Gibraltar. It is half a league in height towards the land, and so steep that there is no approaching it on that side. It was anciently reckoned one of the pillars of Hercules; Abyla being the other.

CALPHURNIA, a female orator of ancient Rome, who pleaded her own causes before the senate; but is said to have proved so troublesome, that they made a law, that thenceforward no woman should be allowed to plead.

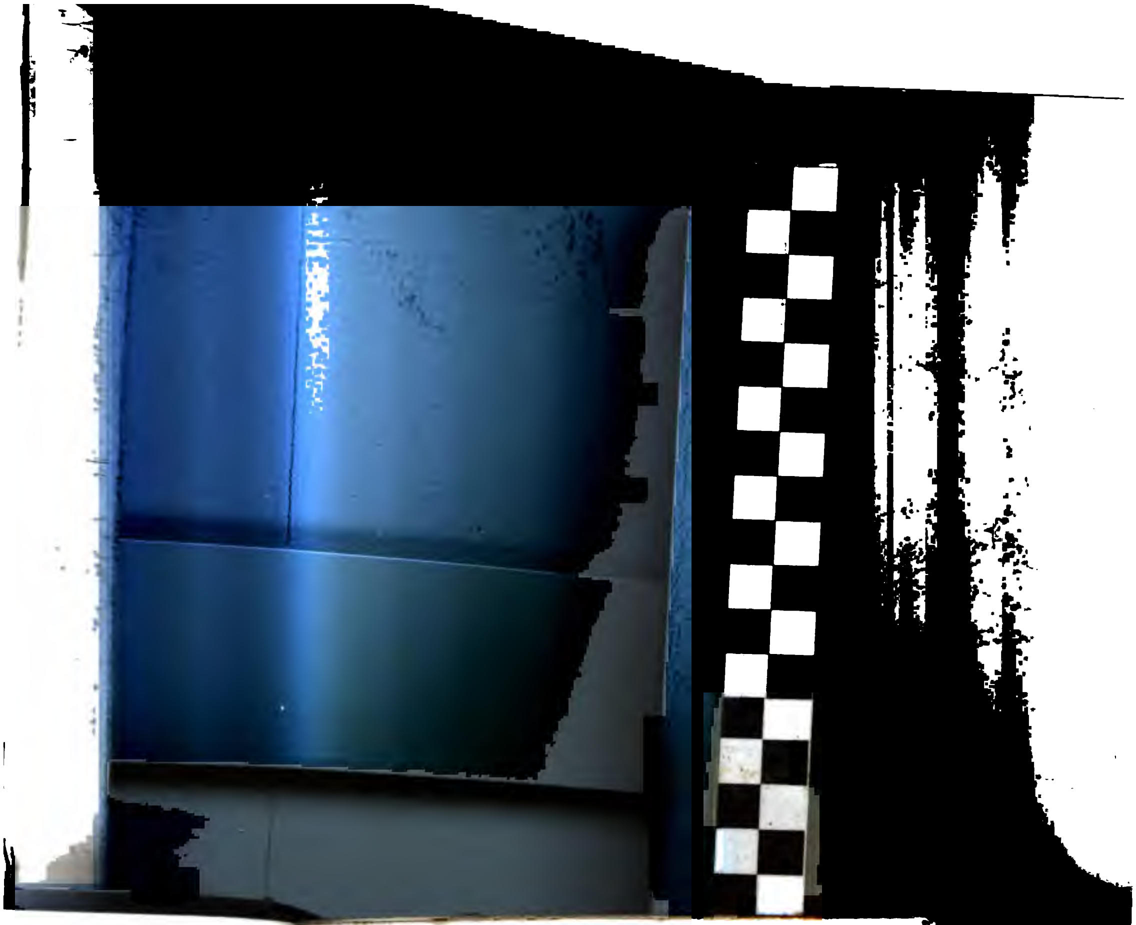
CALPHURNIUS (Titus), a Latin poet of Sicily, who lived under the emperor Carus and his son. Seven of his eclogues are extant.

CALTHA, in botany, marsh marigold, a genus of the monogynia order, in the polyandria class of plants, No calyx; five petals; no nectaria; capsules many, and polyspermous. There are but two species known; viz. 1. C. palustris, with stem erect; found in our own marshes: 2. C. natans, with procumbent floating stem; a native of Siberia. The flowers gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with alum, stains paper yellow. Goats and sheep eat this plant; horses, cows, and swine, refuse it.

CALTROP, in botany. See TRIBULUS.

CAL'TROPS, *n. s.* Sax. colꞇnæppe; an instrument made with three spikes, so that which way soever it falls to the ground, one of them points upright, to wound horses feet.—A plant common in France, Spain, and Italy, where it grows among corn, and is very troublesome; for the fruit being armed with strong prickles, run into the feet of the cattle. This is certainly the plant mentioned in Virgil's Georgics, under the name of tribulus.

> The ground about was thick sown with *caltrops*, which very much incommoded the shoeless Moors.
>
> *Dr. Addison's Account of Tangiers*



[illegible] in which the laws of honor
[illegible] been violated. Our re-
[illegible] resemble the above, espe-
[illegible] of an officer,
[illegible] Coventry.

> *Dr. Addison's Account of Tangiers*

Caltrops, in military affairs, an instrument with four iron points, disposed in an angular form, so that three of them are always on the ground, and the fourth pointing upwards. They are scattered over the ground where the enemy's cavalry is to pass, in order to embarrass them.

CALVA, or Calvaria, from calvus, bald; the scalp or upper part of the cranium, comprehending all above the eyes, temples, ears, and occipital eminence.

CALVART (Denis), a celebrated painter, born at Antwerp in 1552. He studied painting under Fontana and Sabbatini. He opened a school at Bologna, which became celebrated; and from which proceeded Guido, Albani, and other great masters. Calvart was well skilled in architecture, perspective, and anatomy, which he considered as necessary to a painter, and taught to his pupils. His principal works are at Bologna, Rome, and Reggio. He died at Bologna, in 1619.

CALVARY, from calvaria, i. e. the place of a skull, called also Golgotha, which signifies the same, a hill of Judea, west of Jerusalem, on the outside of the city, where our Saviour was crucified, and where malefactors were commonly executed. Some derive the name from the resemblance of the hill to a man's head; others from its baldness, as it was said to be destitute of verdure; but it is more probable, that the hill derived its name from the many skulls of those executed, being carelessly tossed about upon it. Tradition says Adam was buried upon it. The British Princess Helena, the mother of Constantine the Great, about A. D. 330, erected a magnificent church over our Saviour's sepulchre, near it, which is still visited by superstitious pilgrims.

Calvary, in heraldry, a cross, so called because it resembles the cross on which our Saviour suffered. It is always set upon steps.

Calvary, in the customs of the Roman Catholic church, is a term sometimes used for a kind of chapel devotion, raised on a hillock near a city; in memory of the place where Jesus Christ was crucified near Jerusalem. Such was the Calvary of St. Valerian, near Paris: it was accompained with several little chapels, in each of which was represented in sculpture one of the mysteries of the passion. The Roman Catholics vindicate these pictorial exhibitions of the mysteries of religion, as justifiable upon the same principle as any other mode of bringing the facts memorialised upon the eye of the mind; and as particularly useful to those classes of society whose inclinations or avocations will permit them to read or think but little.

CALVERT, a county of the United States, in the Western Shore of Maryland; bounded on the east by the Chesapeake; on the north by Anne-Arundel county; and on the south and west by the river Patuxent. It is thirty-three miles and a half long from the mouth of the Patuxent to Lion's Creek, and nineteen and a half broad. The surface is hilly and the soil sandy; but it produces good crops of Indian corn, though the tobacco is of an inferior quality.

Calvert, George, afterwards Lord Baltimore, was born at Kiplin, in Yorkshire, about 1582, and educated at Oxford, where he took the degree of B. A. He was made secretary to Sir Robert Cecil; he was afterwards knighted, and in 1618 appointed one of the principal secretaries of state. But after he had enjoyed that office about five years, he resigned it, telling king James, that he was become a Roman Catholic,—that he must either be wanting to his trust, or violate his conscience in discharging his office. This ingenuous confession so affected the king, that he continued him privy counsellor all his reign, and created him baron Baltimore. He afterwards obtained a grant of a country on the north part of Virginia from Charles I. who called it Maryland, in honor of his queen; but he died in April, 1632, aged 50, before the patent was made out. It was, however, filled up to his son Cecil, lord Baltimore; and bears date June 20th, 1632. It was held from the crown as part of the manor of Windsor, on one singular condition, viz. to present two Indian arrows yearly, on Easter Tuesday, at the castle, where they are kept and shown to visitors. His lordship wrote, 1. A Latin poem on the death of Sir Henry Upton. 2. Speeches in Parliament. 3. Various Letters of State. 4. The Answer of Tom Tell-Truth. 5. The Practice of Princes. And, 6. The Lamentation of the Kirk.

CALVI (Lazzaro), was born at Genoa, and was one of the scholars of Perino del Vaga, as was his brother Panteolo, with whom he worked. In the Palavicini palace, they painted the celebrated continence of Scipio. Envy worked so strongly in the breast of Lazzaro, that he had recourse to the foulest arts to avenge himself of those who were his rivals. Among those who fell victims to his unprincipled spirit, was Giacomo Bargone, whom he poisoned; and against other artists he contrived the basest machinations, in order to effect their ruin. At length he was employed to paint, in connexion with Andrea Semini and Luca Cambiasi, a picture of the birth of John the Baptist; but though Calvi exercised his best powers, he fell short of Cambiasi, and Lazzaro, in a fit of mortification, went to sea. He followed that occupation twenty years, and then returned to his original profession, which he practised till his eighty-fifth year. He died in 1606 aged 105.

CALVILLE', *n. s.* French; a sort of apple.

CALVIN, or Cauvin, (John), a celebrated reformer of the sixteenth century, whose religious tenets have given rise to a large and respectable party among Protestants, called Calvinists, (which see), was born at Noyon, a city of Picardy, July 10th, 1509. His father was a cooper, in respectable but not affluent circumstances, and sufficiently esteemed in the neighbourhood to be able to introduce his son into the Montmor family; with the children of which he was educated at his father's expense. He was sent with the children of his patron to the College de la Marche, at Paris, then under the regency of Maturin Cordier, and soon became distinguished for his application to study. From the College of La Marche he was removed to that of Mortaign, when he entered upon the pursuit of dialectics and philosophy, under the tuition of a learned Spaniard. In 1529 his father had sufficient interest with the bishop of Noyon to procure the young student a benefice in the cathedral church of that city, and the rectory of Pont L'Eveque, the parish in which he was born. Here, though not ordained, he is said to have preached frequently; but becoming intimate with a protestant relative, Pierre Robert Olivetan, author of a French translation of the Scriptures, he felt dissatisfied with his station, and gradually resolved to quit the Romish communion. His father, at about the same period, began to apprehend that he could better ensure his advancement in life in the law than in the church. He now, therefore, removed to Orleans, and applied himself, with his characteristic ardor, to the lectures of Pierre de L'Etoile, a celebrated civilian, afterwards president of the parliament of Paris. Here he received a doctor's degree; studied the Scriptures as well as the law very closely, and is said by his late night hours to have laid the foundation of a weakness in his stomach, which finally shortened his days. His legal attainments were so universally acknowledged at Orleans, that, in the absence of the professors, he frequently lectured for them before the university. Scaliger says, that at the age of twenty-two he was the most learned man in Europe.

To complete his education for the law, he removed for a short time from Orleans to Bourges, where, while attending the lectures of Andrè Alciat, he contracted an intimate acquaintance with Melchiar Wolmar, the Greek professor of the university. In acknowledgment for Wolmar's instruction in that language, Calvin afterwards dedicated to him his Commentary on the Second Epistle to the Corinthians; and in this neighbourhood he is said to have been occasionally engaged in village preaching.

His father died while he was in his twenty-fourth year, and the circumstance compelled him to close his college life, and, after a short residence at Noyon, to proceed to Paris. In the title page of his first work, a Commentary on Seneca's De Clementia, which he published here in 1533, we first find that slight change in his name, which has been unfairly adverted to. 'In reality,' says Mr. Drelincourt, 'it is very inconsiderable, or rather nothing at all: for being to turn Cauvin (his family name) into Latin, if one would give it an air and termination suitable to the genius of the language, how can one turn it otherwise than by Calvinus?' And 'his first work being written in Latin, and he thereby known by the name of Calvinus, if after that, when he wrote in French, he had used any other name but that of Calvin, the work might have been taken for another man's.' The friends of the reformed religion now heard of his attachment to their system, and induced him to relinquish all secular pursuits. His zeal and sincerity was soon put to the test. Having supplied his friend Nicholas Cop, rector of l'Academie de Paris, with hints for a speech, in which were some severe reflections on popery, the rector, at the instigation of the Sorbonne, was summoned before the parliament, and only eluded punishment by withdrawing to Basil. Calvin was also advised to take flight; and had scarcely quitted Paris when a warrant was issued for his apprehension, and his apartments were searched by the bailiff Marin, one of the most relentless persecutors of the age. His papers disclosed a number of the names of the Protestants who were about, it is said, to be proscribed, when the queen of Navarre interposed in their favor, allayed the storm for a time, and even ventured to recal Calvin. Prudence, however, dictated his retreat from the eye of the hostile authorities; and he chose Saintonge for his place of retirement, where he employed himself in the composition of homilies adapted to the capacities of the common people. He also visited, at this time, the aged Jacques Le Fevre d'Estaples, formerly the tutor of the children of Francis I. who had retired under the protection of the queen of Navarre to Nerac. The worthy old confessor welcomed him heartily, and predicted his future celebrity as an instrument of establishing the true religion. In 1534 Calvin visited Paris, partly with a view to meet the celebrated Michael Servetus, whose opinions respecting the Trinity were now becoming known. It was a journey of some danger, as this year was disgraced by many cruelties inflicted on the reformed at Paris; but Servetus did not appear. The king, it is said, being particularly exasperated at an attack on the mass, which was nailed to the door of the Louvre, went bareheaded with his sons in procession, as an expiation of the crime, ordered eighty of the reformers to be burnt alive in the most conspicuous parts of the capital, and declared that if his own sons were to become infected with their detestable heresy, they should suffer the same fate.

Calvin now determined to quit France, which he did; having first published a treatise, called Psychopannychiam, against the sentiments of those who maintain that the soul sleeps between death and the resurrection. He followed his friend Cop to Basil, where he studied the Hebrew language, and brought together the materials of his great work, the Institutions of the Christian Religion. It was designed as an apology for his persecuted brethren; openly avowing their real differences with the Church of Rome, but defending them from the imputation of teaching the levelling doctrines of the Anabaptists. The first edition, which it is probable was written both in French and Latin, was published in 1535, in 8vo. being only a rough sketch or outline of what is known at present as this work. The second edition appeared in 1536 at Strasburgh, in folio, and was both larger and more correct than the first. The third edition, still more complete, was printed at the same place in 1543. A fourth edition came out, with considerable improvements; and a fifth corrected edition in 4to was printed in 1550 at Geneva, having two indexes. In 1558 the Latin and French editions both received the author's final revision.

The doctrinal peculiarities of this work, we are not engaged, as encyclopædists, to vindicate; few modern Protestants espouse them all: but the palm of erudite learning, profound Scripture knowledge, and superior logical arrangements was universally awarded to its author. Its Latinity has been generally admired, and especially the introductory address to Francis I. Bayle quotes the remarkable testimony of two cele-

synod of Berne. This he did to the full ɹsfaction of that body; procured in less than ɾear after his first coming to Geneva the formal ɹunciation of popery, by the public authoriɛs, and proceeded boldly with his colleagues in ıe reform of the public morals. He thus roused the enmity of many influential persons; ɹnd an unhappy schism arising between the church of Berne and that of Geneva, as to the mode of celebrating the eucharist, these parties did not fail to inflame it. By the synod of Lausanne it was at last decreed that all the churches ought to use unleavened bread at the Lord's supper; Calvin and Farel hesitated to yield obedience to this decree: the result was an order from the council of Geneva for these faithful ministers forthwith to leave the town. 'Ah!' said Calvin, 'had I served men, I should have been poorly recompensed; but I have served a master, who, far from forgetting his true servants, pays them where he has no obligation.'

Our reformer retired to Strasburgh, where, by the influence of Bucer, he was immediately appointed pastor of a church, and professor of theology. Here he composed his Treatise on the Lord's Supper, and an eloquent reply to Cardinal Sadolet, who endeavoured to recal the Genevese to the Catholic church. He also reclaimed many of the people from the Anabaptist errors. In 1541 he attended the diet, convoked to meet at Worms, and afterwards at Ratisbon: and here he was introduced to Melancthon, who ever after spoke of him as 'the theologian' of the day.

The same year the Genevese evinced their regret at his absence by publicly voting for his recal: and the inhabitants of Strasburgh, though they finally relinquished him to the entreaties of the council of that city, bestowed on him the freedom of their own, and offered to continue his emoluments after his return to Geneva. This took place in the latter part of the year 1541; and his system of ecclesiastical discipline, called the Consistory, was established at Geneva by order of the general council, dated the 20th of November in that year. Shortly after his return, he published a Catechism in Latin and French. 'During a fortnight in each month,' we are told, 'he preached every day; gave three lectures in theology every week; assisted at all the deliberations of the consistory, and at the meetings of the pastors; met the congregation every Friday; instructed the French churches by the frequent advices which they solicited from him; defended the Reformation against the attacks of its enemies, and particularly those of the French priests; was forced to repel his numerous antagonists, by various books which he composed for that purpose; and found time to publish several other works, which, by their solidity and depth, are calculated for the instruction of every age.'

In 1543 he composed for the church of Geneva a Liturgy, accompanied with Directions for Celebrating the Ordinances of Baptism and the Lord's Supper. His personal and official character were now held in such high esteem in that city, that its entire affairs, civil and ecclesiastical, were moulded by him: and the snares of secular influence and earthly greatness surrounded him on every side. The learned Castalio having endeavoured to disseminate some opinions differing from those of our reformer, on the descent of Christ into hell, was banished from Geneva. A James Grant is said to have been condemned to death in 1547 for impiety, treason, and speaking disrespectfully of Calvin; and in 1553 drew on the memorable persecution of Servetus by the public authorities.

Previously to this last event, we find him engaged in controversy with the decisions of the council of Trent, in a work called The Antidote: with the divines of Rouen, who had renewed the heresy of Carpocrates on that church, in composing his commentaries in the epistle of St. Paul; and in a correspondence with Luther, Bucer, and all the principal reformers. In 1548 he was joined in the public affairs by the celebrated Beza. He also had a long controversy with Jerome Bolzec, a Carmelite friar, who began to teach the sentiments afterwards espoused by Arminius. The celebrated John Knox visited him at about this period. 'Calvin' says Dr. M'Crie, 'was then in the zenith of his reputation and usefulness, had completed the ecclesiastical establishment of that city; and, having surmounted the opposition raised by those who envied his authority, or disliked his system of doctrine and discipline, was securely seated in the affections of the citizens. His writings were already translated into the different languages of Europe; and Geneva was thronged with strangers from Germany, France, Poland, Hungary, and even from Spain and Italy, who came to consult him about the advancement of the Reformation, or to find shelter from the persecutions to which they were exposed in their native countries. Calvin was respected by none more than by the Protestants of England; and, at the desire of archbishop Cranmer, he had imparted to the protector Somerset, and to Edward VI. his advice as to the best method of advancing the Reformation in that kingdom. Knox was affectionately received by him as a refugee from England; and an intimate friendship was soon formed between them, which subsisted until the death of Calvin in 1564. They were nearly of the same age; and there was a striking similarity in their sentiments and in the more prominent features of their character. The Genevan Reformer was highly pleased with the piety and talents of Knox, who, in his turn, entertained a greater esteem and deference for Calvin than for any other of the Reformers.

Servetus was a Spanish physician, who had acquired a respectable professional character at Vienne; his works Restitutio Christianismi, De Trinitatis Erroribus; et in Ptolemeum Commentarius had also with his heretical pravity established his undoubted claims to considerable learning. It was no palliation of the persecuting zeal of Calvin that the Papists had already condemned some of their performances to be burnt by heresy. Calvin instigated the council of Geneva to sieze, imprison, and finally put the author to a cruel death.

This disgraceful tale has been amplified by the assertion that Calvin wrote to the magistrates of Vienne to procure the arrest of Servetus, that he had thirsted for years for his blood, &c. There is, perhaps, no clear evidence of this: the fact seems to be that Servetus was passing through Geneva to Naples, with a view to find a retreat from persecution, when he fell thus unhappily into its fangs. Nor do we know that the matter is much extenuated (excused it never can be) by the fact that Bucer, and even Melancthon, approved of the conduct of our reformer in instigating the sacrifice of Servetus. The plain truth is, that Calvin was seduced by his dangerous worldly influence, to imagine that he could thus serve the cause of his peaceful and benevolent master: and that he in this instance must stand recorded to posterity in the unholy character of a persecutor unto blood. 'He acted in this case,' say his apologists, 'as he uniformly did, from no party view, or paltry resentments, but from a strong sense of duty, and an ardent love to truth. What he did in it, he did with his characteristic steadiness and zeal: and it is evident, that his chief anxiety was, not to punish Servetus, but to make him retract his error, a design which was frustrated by the obstinacy, the violence, and the impious language, of Servetus himself.' Moreover, persecution we are told was the sin of the age. No part of this apology has, we confess, much weight with us. The spirit of persecution to which the reformers at any time lent themselves was in them the more inexcusable, as they had been themselves, and saw their brethren daily, sufferers from this very spirit. It was the sin against which God in the judgments and trials of that age peculiarly warned them; no admiration of what they effected should make us palliate the enormity of their thus manifesting the disposition of him who was 'a destroyer' from the beginning; and it must have been the pride of the zealot, and the interests of the party being injured, rather than any pure or real love of truth, that ever prompted these bloody deeds: of which in this instance we speak the more freely, because we honor Calvin much.

After this event Calvin's life is chequered with but few matters of public importance. His efforts at promoting a universal Christian discipline at Geneva were often impeded; and his extensive projects for the establishment of his own views of ecclesiastical government, in other countries, not very successful. He was deeply afflicted by the frequent persecution of his brethren in France, and by the disunion among the Protestants of various parts of Europe: the latter he earnestly sought to heal; and certainly, by his talents and remonstrances, abated the violence of the former.

In February, 1564, this great man became conscious of his approaching death; and on the 2d of that month preached his last sermon, and delivered his last lecture in the day. Being visited on the 10th of March by Beza and several private friends, he spoke of his expected departure with great composure and solemnity; and having been carried to the council on the 27th, he took his leave of them with much affection, declaring that he never more expected to appear in that place. On the 2d of April, though much reduced, he attended the

ienne to procure the arrest of Servetus, that he
d thirsted for years for his blood, &c. There
perhaps, no clear evidence of this: the fact seems
be that Servetus was passing through Geneva to
aples, with a view to find a retreat from per-
cution, when he fell thus unhappily into its
ngs. Nor do we know that the matter is much
tenuated (excused it never can be) by the fact
at Bucer, and even Melancthon, approved of
e conduct of our reformer in instigating the
crifice of Servetus. The plain truth is, that
alvin was seduced by his dangerous worldly
fluence, to imagine that he could thus serve
e cause of his peaceful and benevolent master:
d that he in this instance must stand recorded
posterity in the unholy character of a per-
cutor unto blood. 'He acted in this case,'
y his apologists, 'as he uniformly did, from no
rty view, or paltry resentments, but from a
ong sense of duty, and an ardent love to truth.
hat he did in it, he did with his characteristic
eadiness and zeal: and it is evident, that his
ief anxiety was, not to punish Servetus, but to
ake him retract his error, a design which was
istrated by the obstinacy, the violence, and the
pious language, of Servetus himself.' More-
er, persecution we are told was the sin of the
e. No part of this apology has, we confess,
uch weight with us. The spirit of persecution to
hich the reformers at any time lent themselves
s in them the more inexcusable, as they had
en themselves, and saw their brethren daily,
fferers from this very spirit. It was the sin
ainst which God in the judgments and trials
that age peculiarly warned them; no admi-
tion of what they effected should make us
lliate the enormity of their thus manifesting
e disposition of him who was 'a destroyer'
om the beginning; and it must have been the
ide of the zealot, and the interests of the party
ing injured, rather than any pure or real love
truth, that ever prompted these bloody deeds:
which in this instance we speak the more
ely, because we honor Calvin much.
After this event Calvin's life is chequered
th but few matters of public importance.
s efforts at promoting a universal Christian
scipline at Geneva were often impeded; and
extensive projects for the establishment of his
n views of ecclesiastical government, in other
untries, not very successful. He was deeply
licted by the frequent persecution of his bre-
en in France, and by the disunion among the
otestants of various parts of Europe: the
ter he earnestly sought to heal; and certainly,
his talents and remonstrances, abated the
lence of the former.
In February, 1564, this great man became con-
ous of his approaching death; and on the 2d
that month preached his last sermon, and
ivered his last lecture in the day. Being
ited on the 10th of March by Beza and several
vate friends, he spoke of his expected de-
rture with great composure and solemnity;
d having been carried to the council on the
th, he took his leave of them with much
ection, declaring that he never more ex-
ted to appear in that place. On the 2d of
ril, though much reduced, he attended the

public services of his church, and received the sacrament from the hands of Beza. On the 28th, all the clergy of the town and neighbourhood being assembled in the room, he gave them a parting address, exhorting them to steadfastness and perseverance, and instancing his own remarkable success as an encouragement to their labors. His remaining days were devoted to private duties and meditation. He died with great calmness on the 24th of May.

The works and system of Calvin will ever claim for him a distinguished place in the history of modern Christianity. No writer of the Reformation made so many converts to his peculiar views; no one name has designated the religious system of such multitudes. His treatises when all collected in 1560 formed nine volumes folio. For an abstract of his views see below.

CALVINISM, in modern ecclesiastical history, designates certain prominent articles of belief, rather than the entire religious creed of those who avow the system, and it is not strictly the name of a sect, for it is connected with no peculiar form of church government or discipline, but prevails among Episcopalians, Presbyterians, Independents, and Methodists. The Calvinistic Baptists are also numerous.

Many writers, with Dr. Evans (Sketch of the Different Denominations of the Christian World), speak of the tenets of Calvinism as, predestination, original sin, particular redemption, irresistible grace, and the final perseverance of the people of God: sometimes called by theologians the five points. But the doctrine of original sin is by no means peculiar to the Calvinists. It is, with some modifications, a sentiment held by most protestant sects. This author adds, as the Calvinists differ among themselves in the explication of these tenets, it would be difficult to give a specific account of them. Generally speaking, however, they comprehend the following propositions. 1. That God has chosen a certain number in Christ to everlasting glory, before the foundation of the world, according to his immutable purpose, and of his free grace and love, without the least foresight of faith, good works, or any conditions performed by the creature; and that the rest of mankind he was pleased to pass by, and ordain them to dishonor and wrath for their sins, to the praise of his vindictive justice. 2. That Jesus Christ, by his death and sufferings, made an atonement only for the sins of the elect. 3. That mankind are totally depraved in consequence of the fall; and, by virtue of Adam's being their public head, the guilt of his sin was imputed, and a corrupt nature conveyed to all his posterity, from which proceed all actual transgressions; and that by sin we are made subject to death, and all miseries, temporal, spiritual, and eternal. 4. That all whom God has predestined to life, he is pleased, in his appointed time, effectually to call by his word and spirit out of that state of sin and death, in which they are by nature, to grace and salvation by Jesus Christ. And 5. That those whom God has effectually called and sanctified by his spirit shall never finally fall from a state of grace. Some have supposed that the trinity was one of the five points; but this is a mistake, since both the Calvinists and Arminians, who formed the synod of Dort (where this phrase, five points, originated) were on the article of the trinity generally agreed. The most prominent feature of this system is, the election of some, and reprobation of others, from all eternity.

Calvin's own system extended to the discipline and government of the Christian church, the nature of the Eucharist, and the qualification of those who were entitled to the participation of it. He considered every church as a separate and independent body, invested with the power of legislating for itself; and proposed that it should be governed by presbyteries and synods, composed of clergy and laity, without bishops or any clerical subordination; maintaining, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate a union with the Lutheran church, he acknowledged a real, though spiritual, presence of Christ in the Eucharist; that true Christians were united to the man Christ in this ordinance; and that divine grace was conferred upon them, and sealed to them, in the celebration of it. The privilege of communion he confined to pious and regenerate believers. Calvinism long subsisted in its most complete exhibition in the city of Geneva; whence it was propagated into Germany, France, the United Provinces, Scotland, and England. In France it was abolished by the revocation of the edict of Nantz, in 1685. It has has been the prevailing religion in the United Provinces ever since the year 1571. In Scotland the celebrated John Knox not only established the doctrinal sentiments, but the ceremonies, rites, and discipline of the Genevan church as nearly as possible.

In England the discipline of that church, if we except the period of the Commonwealth, never prevailed; but the degree to which, with propriety, the articles of the established creed may be considered as Calvinistic, has, almost from the period of the Reformation, been a matter of controversy. The majority of the clergy certainly have not in general been Calvinists: but numbers of respectable and learned individuals among them are and have been so. These have contended that the thirty-nine articles moderately but decidedly assert the peculiarities of their creed. On the other hand, the bishop of Winchester has published a very popular work, entitled A Refutation of Calvinism, in which he insists that neither the homilies nor any of the formularies of the church contain any thing in favor of that system.

CALUMBA, the root of the cocculus palmatus. This root is imported from Ceylon, in circular, brown knobs, wrinkled on the outer surface, yellowish within, and consisting of woody, and medullary laminæ. Its smell is aromatic, its taste pungent, and very bitter. Spirit of wine extracts its virtues in the greatest perfection, its watery infusion being more perishable than that of other bitters. The extract made first by spirit and then by water, and reduced by evaporation to a semi-fluid consistence, is found to be equal if not superior in efficacy, to the powder. As an antiseptic, Calumba root is certainly inferior to bark; but as a corrector of putrid bile it is greatly superior; whence also it is probable, that it would be of service in the West India yellow fever. It does not appear to have the least heating quality; it occasions no disturbance, and agrees very well with a milk diet, as it is not disposed to acidity. The dose of the powdered root is half a drachm, which, in urgent cases, may be repeated every third or fourth hour.

CALUMET, a symbolical instrument of great importance among the American Indians. It is a pipe, whose bowl is generally made of a soft red marble; the tube of a very long reed, ornamented with wings and feathers of birds. No affair of consequence is transacted without the calumet. It appears in meetings of commerce or exchanges, and in congresses for determining peace or war. The acceptance of the calumet is a mark of concurrence with the terms proposed, as a refusal is a certain mark of rejection. Even in the rage of a conflict this pipe is sometimes offered: and, if accepted, the weapons of destruction instantly drop from their hands, and a truce ensues. The calumet of peace is different from that of war. They make use of the former to seal their alliances and treaties, to travel with safety, and to receive strangers; but of the latter to proclaim war. It consists of a red stone, like marble, formed into a cavity resembling the head of a tobacco pipe, and fixed to a hollow reed. They adorn it with feathers of various colors; and name it the calumet of the sun, to which luminary they present it, in expectation of thereby obtaining a change of weather as often as they desire. From the winged ornaments of the calumet, and its conciliating uses, writers compare it to the caduceus of Mercury, which was carried by the caduceatores of peace, with terms to the hostile states.

CALUMET, DANCE OF THE, is a solemn rite among the Indians on various occasions. They dare not wash themselves in rivers in the beginning of summer, nor taste of the new fruits, without performing it; and the same ceremony always confirms a peace or precedes a war. It is performed in winter in their cabins, and in summer in the open fields. For this purpose they choose a spot among trees to shade them from the heat of the sun, and lay in the middle a large mat, as a carpet, setting upon it the god of the chief of the company. On the right hand of this image they place the calumet, as their great deity, erecting around it a kind of trophy with their arms. The hour of dancing being come, those who are to sing take the most honorable seats under the shade of the trees. The company is then ranged round, every one, before he sits down, saluting the monitor, which is done by blowing upon it the smoke of their tobacco. Each person next receives the calumet in rotation, and holding it with both hands, dances to the cadence of the vocal music, which is accompanied with the beating of a sort of drum. During this exercise, he gives a signal to one of their warriors, who takes a bow, arrow, and axe, from the trophies already mentioned, and fights him; the former defending himself with the calumet only, and both of them dancing all the while. This mock engagement being over, he who holds the calumet makes a speech, in which he gives an account of the battles he has fought, and the prisoners he has taken, and then receives a cloak, or some other present from the chief of the ball. He then resigns the calumet to another, who, having acted a similar part, delivers it to a third, and he to a fourth, &c. till at last the instrument returns to the person who began the ceremony, and who presents it to the nation invited to the feast, as a mark of their friendship, and a confirmation of their alliance.

CALUMNIÆ, JUDICIUM, was an action brought against the plaintiff in a court for a false and malicious accusation. When an accuser did not prove his charge, nor seemed to have sufficient or probable grounds for bringing any, the judges in pronouncing sentence used the formula calumniosus es: which gave the defendant a right to bring an action of calumny; the penalty of which was frontis inustio, or burning on the forehead.

CALUM'NIATE,
CALUMNIA'TION,
CALUM'NIATOR,
CALUM'NIATORY,
CALUM'NIOUS,
CALUM'NIOUSLY,
CALUM'NIOUSNESS,
CALUM'NY.

Lat. *calumnior*; Fr. *calomnier*; to accuse falsely; to charge without just ground; a false and malicious representation to an offensive purpose. To slander; to impeach the credit, and blemish the fame of another by injurious imputations founded in falsehood.

Beauty, wit, high birth, desert in service,
Love, friendship, charity, are subject all
To envious and *calumniating* time. *Shakspeare.*

HAM. If thou dost marry, I'll give thee this plague for thy dowry: Be thou as chaste as ice, as pure as snow, thou shalt not escape *calumny*. Get thee to a nunnery; farewell: Or, if thou wilt needs marry, marry a fool; for wise men know well enough, what monsters you make of them. To a nunnery go; and quickly too. *Id.*

No might nor greatness in mortality,
Can censure 'scape, back-wounding *calumny*,
The whitest virtue strikes. *Id.*

He that would live clear of the envy and hatred of potent *calumniators*, must lay his finger on his mouth, and keep his hand out of the ink-pot. *L'Estrange.*

He mixes truth with falsehood, and has not forgotten the rule of *calumniating* strongly, that something may remain. *Dryden's Fables. Pref.*

One trade or art, even those that should be the most liberal, make it their business to disdain and *calumniate* another. *Sprat.*

It is a very hard *calumny* upon our soil or climate, to affirm, that so excellent a fruit will not grow here. *Temple.*

In order to heal this infirmity, which is natural to the best and wisest of men, I have taken a particular pleasure in observing the conduct of the old philosophers, how they bore themselves up against the malice and detraction of their enemies. The way to silence *calumny*, says Bias, is to be always exercised in such things as are praise-worthy. *Guardian.*

Do I *calumniate*? thou ungrateful Vanoc.—
Perfidious prince!—Is it a *calumny*
To say that Gwendolen, betrothed to Yver,
Was by her father first assured to Valens?
A. Philips.

nock engagement being over, he who holds the alumet makes a speech, in which he gives an ccount of the battles he has fought, and the risoners he has taken, and then receives a cloak, or some other present from the chief of the hall. Ie then resigns the calumet to another, who, aving acted a similar part, delivers it to a third, nd he to a fourth, &c. till at last the instrument eturns to the person who began the ceremony, nd who presents it to the nation invited to the east, as a mark of their friendship, and a confirmation of their alliance.

CALUMNIÆ, Judicium, was an action rought against the plaintiff in a court for a false nd malicious accusation. asure in observing the conduct of the old philoso-
rs, how they bore themselves up against the
ice and detraction of their enemies. The way to
ace *calumny*, says Bias, is to be always exercised
uch things as are praise-worthy. *Guardian.*

Do I *calumniate?* thou ungrateful Vanoc.—
erfidious prince!—Is it a *calumny*
o say that *Gwendolen*, betrothed to Yver,
as by her father first assured to *Valens?* *A. Philips.*

Behold the host! delighting to deprave,
Who track the steps of glory to the grave,
Watch every fault that daring genius owes,
Half to the ardours which its birth bestows,
Distort the truth, accumulate the lie,
And pile the pyramid of *Calumny!* *Byron.*

Calumny was admirably personified by Apelles. This celebrated painter, having been accused of conspiracy against Ptolemy, king of Egypt; determined to represent calumny in a picture. On the right of this celebrated piece was seated a man with large ears, resembling Midas, stretching out his hand to Calumny, who approached him; and near him were placed two female figures, of Ignorance and Diffidence. On the other side stood Calumny, a beautiful female, appearing agitated and enraged; she held in her left hand a flaming torch, and with her right she dragged by the hair a youth, who was lifting his hands towards the heavens, and calling the gods to witness in his favor. Before her moved a pale and deformed man, with piercing eyes, who seemed to have just recovered from a long illness: this was Envy. Two other females conversed with Calumny: these were Concealment and Deceit. Another female followed, clothed in black, with tattered garments, which was Repentance; she turned her head backward, dissolved in tears, and looked with shame upon Truth who approached her.

Calumny, Oath of, Juramentum, or rather Jusjurandum, Calumniæ, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint was dismissed; if the defendant, it was taken pro confesso. The juramentum calumniæ is much disused, as a great occasion of perjury. Anciently the advocates and proctors also took this oath, but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice.

CALX properly signifies lime, but is used by chemists and physicians for a fine powder remaining after the calcination or corrosion of metals and other mineral substances. All metalic calces made by fire, are found to weigh more than the metal from which they were originally produced.

Calx Nativa, in natural history, a kind of marly earth, of a dead whitish color, which, if thrown into water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime or plaster of Paris. It is found in England.

Calx Viva, or quick-lime, that whereon no water has been cast, in contradistinction to lime which has been slacked. See Lime.

CALYCANTHUS, in botany, a genus of the polygynia order, in the icosandria class of plants: cal. is monophyllous, urceolate, with small colored leaves: cor. consisting of the leaves on the calyx; the styles are numerous, each with a glandula stigma; the seeds are many, each with a train, within a succulent calyx. The species are all shrubs, the chief are, 1. C. floridus, flowering calycanthus, or Carolina allspice tree, a native of Carolina. It is of a brown color, and when bruised emits a most agreeable odor. The leaves that garnish this delightful aromatic are of an oval figure, pointed, nearly four inches long, and at least two and a-half broad, placed opposite by pairs on the branches. At the end of these stand the flowers, of a kind of chocolate purple color, and possessed of the opposite qualities of the bark on the branches. They stand single on their short foot-stalks, come out in May and June, and are succeeded by ripe seeds in England. The propagation of this shrub is not very difficult.

Calycanthus Præcox, a native of Japan. This species is not inured to the climate of Britain.

CALYCERA, from *καλυξ*, calyx, and *κερας*, a horn; a genus of plants, of the class syngenesia, order segregata: cal. common, polyphyllous proper, five-toothed. Florets tubular, male and hermaphrodite, seeds naked. There is but one species, C. herbacea; native of Chili.

CALYCIFLORUS, in zoology, a species of brachionus, of a simple form, the shell being crenated behind, and the upper lip four-toothed. Found in standing waters, but invisible to the naked eye.

CALYCINA, in entomology, a Swedish species of aranea; the aranea Kleynii of Scopoli. It is of a pale yellowish color, and derives its name from its habit of secreting itself in the calyces of flowers from which the corolla has fallen, to fasten on the flies that are tempted thither in search of the nectareous juices.

Calycina Methodus, Calycine Method, a system of botanical classification, founded upon the calyx, and published by Linnæus at Leyden, in 1738, in his Classes Plantarum.

CAL'YCLE, *n. s.* Lat. *calyculus*; a small bud of a plant.

CALYDON, a city of Ætolia, where Œneus, the father of Meleager reigned. The Evenus flows through it, and it receives its name from Calydon the son of Ætolus. During the reign of Œneus, Diana sent a wild boar to ravage the country, on account of the neglect which had been shown to her divinity by the king. All the princes of that age assembled to hunt this boar, which event was greatly celebrated by the poets, under the name of the chase of the Calydonian boar. Meleager killed the animal with his own hand, and gave the head to Atalanta, of whom he was enamoured. The skin was preserved, and was still seen in the time of Pausanias, in the temple of Minerva. The tusks were also preserved by the Arcadians in Tegea, and Augustus carried them away to Rome, because the people of Tegea had followed the party of Antony. These tusks were shown for a long time at Rome, one of them was about half an ell long, and the other was broken. See Meleager and Atalanta.

CALYPLECTUS, in botany, a genus of plants, of the class icosandria, order monogynia: cal. bell-shaped, perianth leathery, with from ten to twelve folds, and the same number of teeth: cor.

ten to twelve petals, attached to the folds of the calyx: STAM. about thirty: PIST. germ superior, striated: PERIC. capsule, one celled, longitudinally striated in its upper part, opening irregularly. Seeds numerous, and membranous.

CALYPSO, in entomology, an African species of papilio, distinguished by having the wings roundish and yellow; a dot, the tip of the anterior pair, and the margin of the posterior ones black.

Calypso, one of the Oceanides, or a daughter of Atlas, according to some writers, was goddess of silence, and reigned in the island of Ogygia. But the situation, and even the existence, of this island is doubted. When Ulysses was shipwrecked on her coasts, she received him with great hospitality, and offered him immortality if he would remain with her as a husband. The hero refused, and after seven years' delay, he was permitted to depart from the island by order of Mercury, the messenger of Jupiter. During his stay, Ulysses had two sons by Calypso, Nausithous and Nausinous. Calypso was inconsolable at the departure of Ulysses.

CALYPTRA, in botany, the calyptre, a tender skin that loosely covers the top of the theca, like a cup. The calyptra is villose or hairy, when composed of hairs; entire, when it covers the whole top of the theca, dimidiate when it half covers the theca, and dentated when the rim is set with teeth.

CALYX, in botany. See Botany.

CAM, or Granta, a river of England, formed by the junction of the Rhee which rises in Hertfordshire, and the Granta which rises in Essex. This takes place near Cambridge, to which the united stream gives name, and afterwards flows into the Ouse.

CAMÆA, in natural history, a genus of the semi-pellucid gems, approaching to the onyx structure, being composed of zones, and formed on a crystalline basis; but having the zones very broad and thick, and laid alternately one on another, usually less transparent and more debased with earth than the onyxes. There are four species; viz. 1. the dull-looking onyx, with broad black and white zones; the camæa of the moderns, and the Arabian onyx. It is found in Egypt, Arabia, Persia, and the East Indies. 2. The dull broad-zoned, green and white camæa, or the jaspicameo of the Italians; found in the East Indies, and some parts of America. 3. The hard camæa, with broad white and chestnut colored veins. 4. The hard camæa, with bluish, white, and flesh-colored broad veins, being the sardonyx of Pliny's time, brought from the East Indies.

CAMAHA, in the materia medica, a name given by Avicenna and others to the large mushrooms found in the deserts of Numidia, and many other parts of Africa. They are white on the outside: the modern Africans call them terfon, and are very fond of them; they eat them with milk, water, and spices, and account them wholesome and nutritive.

CAMA'IEU, *n. s.* From *camehuia*, which name is given by the orientals to the onyx, when, in preparing it, they find another color. A stone with various figures and representations of landscapes, formed by nature. In painting, a term used when there is only one color, and where the lights and shadows are of gold, wrought on a golden or azure ground. This kind of work is chiefly used to represent basso relievos.

Camaieu, or Camayeu, in mineralogy, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures and representations of landscapes, &c. formed by a kind of lusus naturæ; so as to exhibit pictures without painting. The word comes from camehuia, a name the Orientals gave to the onyx, when they find, in preparing it, another color. It is now used to express those precious stones, as onyxes, cornelians, and agates, whereon the lapidaries employ their art to aid nature, and perfect those representations; and also any kind of gem, whereon figures may be engraven, either indented, or in relievo. In this sense the lapidaries of Paris were called in the statutes, cutters of camayeux. It is more particularly used for those stones of differently colored laminæ. These laminæ are left or removed with much art, for the head, the beard, the hair, and other colors of a bust. Some antique cameos have four layers, as the fine one of the apotheosis of Augustus, and that of Germanicus in the Royal Library at Paris; one of the same subject as the first mentioned, and another of Rome and Augustus, in the cabinet at Vienna.

CAMALDOLITES, Camaldulians, or Camaldunians, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the desert of Camaldoli. Their rule is that of St. Benedict; and their houses, by the statutes, are never to be less than five leagues from cities. The Camaldolites have not borne that title from the beginning of their order; till the close of the eleventh century they were called Romualdins, from the name of their founder. Till that time, Camaldolite was a particular name for those of the desert Camaldoli; and D. Grandi observes, was not given to the whole order, in regard it was in this monastery that the order commenced, but because the regulation was best maintained here. Guido Grandi, mathematician to the grand duke of Tuscany, and a monk of this order, published Camaldulian Dissertations, on the origin and establishment of it. They were disguished into two classes, viz. Cœnobites and Eremites.

CAMALODUNUM, in ancient geography, a town of the Trinobantes, the first Roman colony of veterans in Britain. From the Itineraries it appears to have stood where Malden now stands. It continued to be an open place under the Romans; a place of pleasure rather than strength; adorned with splendid works, as a theatre, and a temple of Claudius: which the Britons considered as badges of slavery, and which gave rise to several commotions.

CAMARGUE, or Camarque, La, a tract of Provence, France, insulated by the two principal mouths of the Rhone. It is sometimes called the Delta of France. It is a cluster of islands, spread over nearly 200 square miles, and separated only by canals. The soil is fertile in corn and pasture, though very marshy in particular places, and much impregnated with salt.

ly 200 square miles, and sepa-
nals. The soil is fertile in
though very marshy in parti-
much impregnated with salt.

3000 black cattle are said to be found here, a like stock of horses, and 40,000 sheep. The island is the property of the town of Arles; and belongs to the department of the Mouths of the Rhone. It is divided into nine parishes, and numerous villages.

CAMARINA, in ancient geography, a city of Sicily, built by the Syracusans on an eminence near the sea, in the south of Sicily, to the west of the promontory Pachynum, between the rivers Hipparis and Oanus. Nothing remains but its ancient walls, a mile and a half in compass; with a few houses. It is now called Camarana.

CAMARINA PALUS, a marsh or lake, near the city, from which it took its name. In a time of drought, the stench of the lake produced a pestilence; upon which the inhabitants consulted the oracle, whether they should not drain it. The oracle dissuaded them: they notwithstanding drained it, and opened a way for their enemies to come and plunder their city: hence the proverb, Ne moveas Camarinam, that is, not to remove one evil to bring on a greater. It is now called Lago di Camarana.

CAMARINES, a province on the south of Luçon, one of the Philippine islands. There are several hot springs here, and some of a petrifying quality. The capital is Caceres.

CAMARONES, a large river of western Africa, which is, however, but little known to Europeans. It forms at its mouth a number of alluvial islands. Long. 9° 0′ E., lat. 3° 30′ S.

CAMARONES, a river of Patagonia, which, forming a bay of that name, falls into the Atlantic in lat. 44° 45′ S.

CAMAROSIS, in surgery, denotes a fracture of a bone, wherein the two broken ends rise and form a kind of arch. It is chiefly applied to fractures in the skull.

CAMASSEI, or CAMACE, (Andrew), painter of history and landscape; was born at Bevagna, and studied under Dominichino and Sacchi. He was employed in St. Peter's at Rome, and at St. John Lateran; and his works are much admired for sweetness of coloring, and delicacy of pencil. He died in the bloom of life, when his reputation was daily advancing, A. D. 1657.

CAMBAHEE, a considerable river of South Carolina, formed by the junction of two large streams which rise in Orangeburg, and after passing into Charleston district, unite, and running south-east, enter St. Helena Sound, a little to the south-west of Ashepoo.

CAMBAL, a fertile and hilly district of Southern Abyssinia. Its inhabitants are independent, and consist of Christians, Mahommedans, and Pagans.

CAMBAY, a sea-port town of Ahmedabad, Hindostan, in the province of Gujerat, the Cumanes of Ptolemy. It stands at the top of a gulf of the same name, and was formerly a flourishing commercial port, but the sea has retired from the coast considerably, and the navigation of the gulf is dangerous. Its principal trade now is in corn, cornelians, and cottons, for Bombay; and a few elephants' teeth and cornelians for the China markets. There are three extensive bazaars. The town is surrounded by a brick wall, and most of the houses are of brick or stone. The wall is about five miles in circuit, enclosing five noble reservoirs of water. The inhabitants are considered very expert plasterers. So early as the fifth century this town is conjectured to have been the capital of the Baleyras and of the western Hindoo emperors. It was taken by the Mahommedans in the thirteenth century, and in the sixteenth presented to the Portuguese the magnificent ruins of a first-rate city: but these were more to the south than the site of the present town. Here, however, are still seen Hindoo subterranean temples, constructed since the Mahommedan invasion, and the houses of opulent persons contain numerous apartments under ground. In a subterranean Jain temple are two statues of deities of large size. The inscription on one, which is white, intimates that it is an image of Parswanatha, carved and consecrated in the reign of the emperor Acber, A.D. 1602. That on the other, the black one, has merely the date 1651, with the names of two Banyans who brought it here. This place was first taken possession of by the British in 1780, but restored three years afterwards to the Mahrattas. It was again taken in the last Mahratta war, and confirmed to the company in 1803. It is in the jurisdiction of Broach.

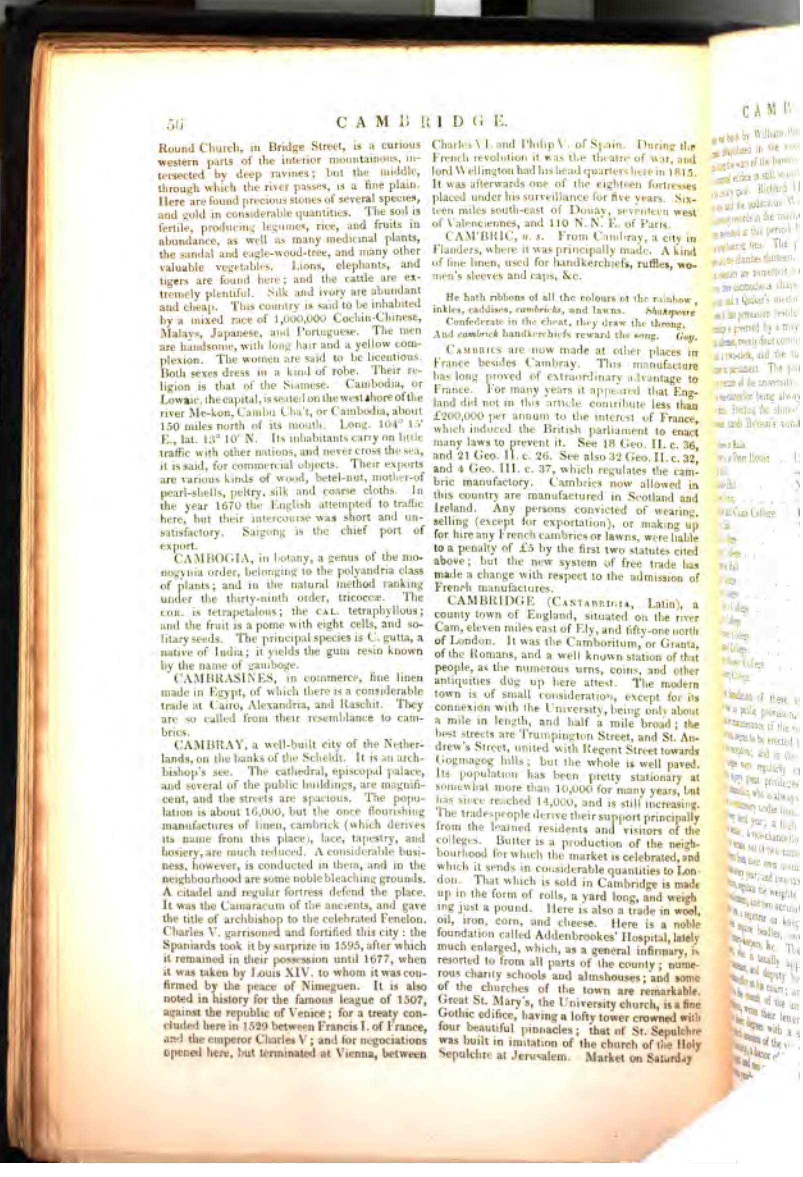
CAMBAYES, in commerce, cotton cloths made at Bengal, Madras, and some other places on the coast of Coromandel. They are proper for the trade of Marseilles, whither the English at Madras sent great numbers of them. Many of them are also imported to Holland.

CAM'BER, *n.* } Lat. *camurus;* Fr. *cambre;* Per. *khami*, an arch or
CAM'BERING. }
curve. A word mentioned by Skinner as peculiar to ship-builders, who say that a place is cambering, when they mean arched.

> *Camber*, a piece of timber cut arching, so as a considerable weight being set upon it, it may in length of time be induced to a straight.
>
> *Moxon's Mechanical Exercises.*

CAMBERT, a French musician of the seventeenth century, much admired for the manner in which he touched the organ. He became superintendent of music to Anne of Austria, the queen-mother. The abbe Perin associated him in the privilege he obtained of setting up an opera in 1669. Cambert set to music two pastorals, one entitled Pomona, the other Ariadne, which were the first operas given in France. He also wrote a piece entitled The Pains and Pleasures of Love. These pieces pleased the public; yet, in 1672, Lully obtained the privilege of the opera, and Cambert came to England, where he became superintendent of music to king Charles II. and died in 1677.

CAMBODIA, a country of Asia, in the East Indies, bounded on the north by the kingdom of Laos, on the east by Cochin-China and Tsiampa, and on the south and west by the gulf and kingdom of Siam. It extends about 400 miles from north to south, and 150 in breadth from east to west, being watered by a fine stream, generally known by the name of the country. The coast is flat and woody; the eastern and



Round Church, in Bridge Street, is a curious western parts of the interior mountainous, intersected by deep ravines; but the middle, through which the river passes, is a fine plain. Here are found precious stones of several species, and gold in considerable quantities. The soil is fertile, producing legumes, rice, and fruits in abundance, as well as many medicinal plants, the sandal and eagle-wood-tree, and many other valuable vegetables. Lions, elephants, and tigers are found here; and the cattle are extremely plentiful. Silk and ivory are abundant and cheap. This country is said to be inhabited by a mixed race of 1,000,000 Cochin-Chinese, Malays, Japanese, and Portuguese. The men are handsome, with long hair and a yellow complexion. The women are said to be licentious. Both sexes dress in a kind of robe. Their religion is that of the Siamese. Cambodia, or Lowaic, the capital, is seated on the west shore of the river Me-kon, Cambu Cha't, or Cambodia, about 150 miles north of its mouth. Long. 104° 15' E., lat. 13° 10' N. Its inhabitants carry on little traffic with other nations, and never cross the sea, it is said, for commercial objects. Their exports are various kinds of wood, betel-nut, mother-of pearl-shells, peltry, silk and coarse cloths. In the year 1670 the English attempted to traffic here, but their intercourse was short and unsatisfactory. Saigong is the chief port of export.

CAMBOGIA, in botany, a genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the thirty-ninth order, tricoccæ. The cor. is tetrapetalous; the CAL. tetraphyllous; and the fruit is a pome with eight cells, and solitary seeds. The principal species is C. gutta, a native of India; it yields the gum resin known by the name of gamboge.

CAMBRASINES, in commerce, fine linen made in Egypt, of which there is a considerable trade at Cairo, Alexandria, and Raschit. They are so called from their resemblance to cambrics.

CAMBRAY, a well-built city of the Netherlands, on the banks of the Scheldt. It is an archbishop's see. The cathedral, episcopal palace, and several of the public buildings, are magnificent, and the streets are spacious. The population is about 16,000, but the once flourishing manufactures of linen, cambrick (which derives its name from this place), lace, tapestry, and hosiery, are much reduced. A considerable business, however, is conducted in them, and in the neighbourhood are some noble bleaching grounds. A citadel and regular fortress defend the place. It was the Camaracum of the ancients, and gave the title of archbishop to the celebrated Fenelon. Charles V. garrisoned and fortified this city: the Spaniards took it by surprize in 1595, after which it remained in their possession until 1677, when it was taken by Louis XIV. to whom it was confirmed by the peace of Nimeguen. It is also noted in history for the famous league of 1507, against the republic of Venice; for a treaty concluded here in 1529 between Francis I. of France, and the emperor Charles V; and for negociations opened here, but terminated at Vienna, between Charles VI. and Philip V. of Spain. During the French revolution it was the theatre of war, and lord Wellington had his head quarters here in 1815. It was afterwards one of the eighteen fortresses placed under his surveillance for five years. Sixteen miles south-east of Douay, seventeen west of Valenciennes, and 110 N. N. E. of Paris.

CAM'BRIC, *n. s.* From Cambray, a city in Flanders, where it was principally made. A kind of fine linen, used for handkerchiefs, ruffles, women's sleeves and caps, &c.

> He hath ribbons of all the colours of the rainbow, inkles, caddises, *cambricks*, and lawns. *Shakspeare*
>
> Confederate in the cheat, they draw the throng,
> And *cambrick* handkerchiefs reward the song. *Gay.*

CAMBRICS are now made at other places in France besides Cambray. This manufacture has long proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than £200,000 per annum to the interest of France, which induced the British parliament to enact many laws to prevent it. See 18 Geo. II. c. 36, and 21 Geo. II. c. 26. See also 32 Geo. II. c. 32, and 4 Geo. III. c. 37, which regulates the cambric manufactory. Cambrics now allowed in this country are manufactured in Scotland and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any French cambrics or lawns, were liable to a penalty of £5 by the first two statutes cited above; but the new system of free trade has made a change with respect to the admission of French manufactures.

CAMBRIDGE (CANTABRIGIA, Latin), a county town of England, situated on the river Cam, eleven miles east of Ely, and fifty-one north of London. It was the Camboritum, or Granta, of the Romans, and a well known station of that people, as the numerous urns, coins, and other antiquities dug up here attest. The modern town is of small consideration, except for its connexion with the University, being only about a mile in length, and half a mile broad; the best streets are Trumpington Street, and St. Andrew's Street, united with Regent Street towards Gogmagog hills; but the whole is well paved. Its population has been pretty stationary at somewhat more than 10,000 for many years, but has since reached 14,000, and is still increasing. The tradespeople derive their support principally from the learned residents and visitors of the colleges. Butter is a production of the neighbourhood for which the market is celebrated, and which it sends in considerable quantities to London. That which is sold in Cambridge is made up in the form of rolls, a yard long, and weighing just a pound. Here is also a trade in wool, oil, iron, corn, and cheese. Here is a noble foundation called Addenbrookes' Hospital, lately much enlarged, which, as a general infirmary, is resorted to from all parts of the county; numerous charity schools and almshouses; and some of the churches of the town are remarkable. Great St. Mary's, the University church, is a fine Gothic edifice, having a lofty tower crowned with four beautiful pinnacles; that of St. Sepulchre was built in imitation of the church of the Holy Sepulchre at Jerusalem. Market on Saturday

That which is sold in Cambridge is made up in the form of rolls, a yard long, and weighing just a pound. Here is also a trade in wool, oil, iron, corn, and cheese. Here is a noble foundation called Addenbrookes' Hospital, lately much enlarged, which, as a general infirmary, is resorted to from all parts of the county; numerous charity schools and almshouses; and some of the churches of the town are remarkable. Great St. Mary's, the University church, is a fine Gothic edifice, having a lofty tower crowned with four beautiful pinnacles; that of St. Sepulchre was built in imitation of the church of the Holy Sepulchre at Jerusalem. Market on Saturday.

Cambridge Castle was built by William the Conqueror, but much dilapidated in the succeeding reigns and during the wars of the barons; a gate house of the original edifice is still standing, and is now the county gaol. Richard II. held a parliament here, and the audacious Wat Tyler burnt the University records in the market place. It was often molested at this period by outlaws from the neighbouring fens. The parishes are fourteen, and the churches thirteen, in number; and the dissenters are numerous and respectable, having three commodious chapels, one of smaller size, and a Quaker's meeting-house, though none of that persuasion reside in the town. Cambridge is governed by a mayor, recorder, thirteen aldermen, twenty-four common council-men, and a town-clerk, and the town sends two members to parliament. The police is under the joint direction of the university and corporation, the vice-chancellor being always a magistrate ex officio. Fronting the shire-hall, in the market-place, stands Hobson's conduit, the gift of a celebrated horse jockey and carrier, in the reign of James I., whose conduct gave rise to the expression of Hobson's choice, 'that or none;' for in letting out his horses he strictly followed that rotation which gave each an equal share of work; and refused, it is said, to let any other than that which stood next. Near the gardens of Bene't College is a botanic garden of five acres, with a large house for the use of the governors, curator, &c., given to the University by the late Dr. Walker, and augmented by the benefaction of the late Dr. Betham.

The *University of Cambridge* consists of thirteen colleges and four halls, the latter enjoying equal privileges with the former. The remote antiquity that has been claimed for it need not here engage much attention. Sigebert, king of the East Angles in 630, was the first founder of whom any credible account remains; but few, or none, of the existing colleges were built or endowed until the thirteenth century. The following is the order of their foundation:—

Colleges or Halls.	Founders.	A. D.
St. Peter's, or Peter House .	Hugo de Balsham	1257
Clare Hall	————————	1326, 1342
Pembroke Hall	Mary de St. Paul	1343
Corpus Christi	————————	1356
Gonville and Caius College .	Edmund Gonville and Dr. Caius	1348, 1557
Trinity Hall	William Bateman, bishop of Norwich .	1351
King's College	Henry VI. VII. and VIII.	1441
Queen's College	Margaret of Anjou	1448
Catherine Hall	Robert Woodlark	1474
Jesus College	John Alcock, bishop of Ely	1496
Christ College	Margaret, countess of Richmond . .	1506
St. John's College	The same	1511
Trinity College	Henry VIII.	1540
Magdalen College	Thomas, lord Audley	1542
Emanuel College	Sir Walter Mildmay	1584
Sidney Sussex College . . .	Frances, countess of Sussex	1593
Downing College . . .	Sir George Downing	1800

At the first foundation of these splendid schools there was no public provision for the accommodation or maintenance of the scholars; but afterwards inns began to be erected by pious persons for their reception; and in the time of Edward I. colleges were regularly endowed. The university enjoys great privileges. It is governed by a chancellor, who is always a nobleman, and has a commissary under him, but may be changed every third year; a high steward, chosen by the senate; a vice-chancellor, chosen annually by the senate, out of two named by the heads of colleges from their own number; two proctors, chosen every year; and two taxers, who, with the proctors, regulate the weights and measures; two moderators, and two scrutators. The other officers are, a registrar or keeper of the archives, three esquire beadles, one yeoman beadle, the library-keepers, &c. There is also a commissary, who is usually appointed an assistant, or accessor, and deputy high-steward to the vice-chancellor in his court; and a public orator, who is the mouth of the university on public occasions, writes their letters, presents noblemen to their degrees with a speech, &c. The caput (which consists of the vice-chancellor, a doctor of divinity, a doctor of laws, a doctor of physic, a regent and non-regent master of arts, who are chosen yearly on the twelfth of October), are to consider and determine what graces are proper to be brought before the body of the university, and each of them has a negative voice. All graces must first pass the caput before they can be produced to the senate. Each college has its school and library, as at Oxford, of which those of Trinity and St. John are the most considerable. The senate of this university includes all the doctors and masters of arts, and is divided into two houses: the first consisting of regents, or those who have not been masters of arts five years, called white-hoods, from the lining of their hoods. The second are non-regents, or those who have taken the degree of master upwards of five years, but have not advanced to the degree of doctor; these are called black-hoods. The doctors under two years standing can vote only in the regent-house; but all others may vote in which house they please. In the senate-house the rejection of all officers, the appointment of the magistrates, and the admission to degrees, takes place; and no language but Latin is permitted to be spoken at its meetings. Besides the fellows and scholars, there are two other orders, called pensioners, the greater and the less; the former are the young nobility, and gentlemen of fortune, called fellow-commoners, because they dine with the fellows: the less are dieted with the scholars. There is

Round Church, in Bridge Street, is a curious western parts of the interior mountainous, intersected by deep ravines; but the middle, through which the river passes, is a fine plain. Here are found precious stones of several species, and gold in considerable quantities. The soil is fertile, producing legumes, rice, and fruits in abundance, as well as many medicinal plants, the sandal and eagle-wood-tree, and many other valuable vegetables. Lions, elephants, and tigers are found here; and the cattle are extremely plentiful. Silk and ivory are abundant and cheap. This country is said to be inhabited by a mixed race of 1,000,000 Cochin-Chinese, Malays, Japanese, and Portuguese. The men are handsome, with long hair and a yellow complexion. The women are said to be licentious. Both sexes dress in a kind of robe. Their religion is that of the Siamese. Cambodia, or Lowaic, the capital, is seated on the west shore of the river Me-kon, Cambu Cha't, or Cambodia, about 150 miles north of its mouth. Long. 104° 15′ E., lat. 13° 10′ N. Its inhabitants carry on little traffic with other nations, and never cross the sea, it is said, for commercial objects. Their exports are various kinds of wood, betel-nut, mother-of pearl-shells, peltry, silk and coarse cloths. In the year 1670 the English attempted to traffic here, but their intercourse was short and unsatisfactory. Saigong is the chief port of export.

CAMBOGIA, in botany, a genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the thirty-ninth order, tricoccæ. The COR. is tetrapetalous; the CAL. tetraphyllous; and the fruit is a pome with eight cells, and solitary seeds. The principal species is C. gutta, a native of India; it yields the gum resin known by the name of gamboge.

CAMBRASINES, in commerce, fine linen made in Egypt, of which there is a considerable trade at Cairo, Alexandria, and Raschit. They are so called from their resemblance to cambrics.

CAMBRAY, a well-built city of the Netherlands, on the banks of the Scheldt. It is an archbishop's see. The cathedral, episcopal palace, and several of the public buildings, are magnificent, and the streets are spacious. The population is about 16,000, but the once flourishing manufactures of linen, cambrick (which derives its name from this place), lace, tapestry, and hosiery, are much reduced. A considerable business, however, is conducted in them, and in the neighbourhood are some noble bleaching grounds. A citadel and regular fortress defend the place. It was the Camaracum of the ancients, and gave the title of archbishop to the celebrated Fenelon. Charles V. garrisoned and fortified this city: the Spaniards took it by surprize in 1595, after which it remained in their possession until 1677, when it was taken by Louis XIV. to whom it was confirmed by the peace of Nimeguen. It is also noted in history for the famous league of 1507, against the republic of Venice; for a treaty concluded here in 1529 between Francis I. of France, and the emperor Charles V; and for negociations opened here, but terminated at Vienna, between Charles VI. and Philip V. of Spain. During the French revolution it was the theatre of war, and lord Wellington had his head quarters here in 1815. It was afterwards one of the eighteen fortresses placed under his surveillance for five years. Sixteen miles south-east of Douay, seventeen west of Valenciennes, and 110 N. N. E. of Paris.

CAM'BRIC, *n. s.* From Cambray, a city in Flanders, where it was principally made. A kind of fine linen, used for handkerchiefs, ruffles, women's sleeves and caps, &c.

> He hath ribbons of all the colours of the rainbow, inkles, caddises, *cambricks*, and lawns. *Shakspeare*
>
> Confederate in the cheat, they draw the throng,
> And *cambrick* handkerchiefs reward the song. *Gay.*

CAMBRICS are now made at other places in France besides Cambray. This manufacture has long proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than £200,000 per annum to the interest of France, which induced the British parliament to enact many laws to prevent it. See 18 Geo. II. c. 36, and 21 Geo. II. c. 26. See also 32 Geo. II. c. 32, and 4 Geo. III. c. 37, which regulates the cambric manufactory. Cambrics now allowed in this country are manufactured in Scotland and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any French cambrics or lawns, were liable to a penalty of £5 by the first two statutes cited above; but the new system of free trade has made a change with respect to the admission of French manufactures.

CAMBRIDGE (CANTABRIGIA, Latin), a county town of England, situated on the river Cam, eleven miles east of Ely, and fifty-one north of London. It was the Camboritum, or Granta, of the Romans, and a well known station of that people, as the numerous urns, coins, and other antiquities dug up here attest. The modern town is of small consideration, except for its connexion with the University, being only about a mile in length, and half a mile broad; the best streets are Trumpington Street, and St. Andrew's Street, united with Regent Street towards Gogmagog hills; but the whole is well paved. Its population has been pretty stationary at somewhat more than 10,000 for many years, but has since reached 14,000, and is still increasing. The tradespeople derive their support principally from the learned residents and visitors of the colleges. Butter is a production of the neighbourhood for which the market is celebrated, and which it sends in considerable quantities to London. That which is sold in Cambridge is made up in the form of rolls, a yard long, and weighing just a pound. Here is also a trade in wool, oil, iron, corn, and cheese. Here is a noble foundation called Addenbrookes' Hospital, lately much enlarged, which, as a general infirmary, is resorted to from all parts of the county; numerous charity schools and almshouses; and some of the churches of the town are remarkable. Great St. Mary's, the University church, is a fine Gothic edifice, having a lofty tower crowned with four beautiful pinnacles; that of St. Sepulchre was built in imitation of the church of the Holy Sepulchre at Jerusalem. eat St. Mary's, the University church, is a fine
thic edifice, having a lofty tower crowned with
r beautiful pinnacles; that of St. Sepulchre
s built in imitation of the church of the Holy
pulchre at Jerusalem. Market on Saturday

Cambridge Castle was built by William the Conqueror, but much dilapidated in the succeeding reigns and during the wars of the barons; a gate house of the original edifice is still standing, and is now the county gaol. Richard II. held a parliament here, and the audacious Wat Tyler burnt the University records in the market place. It was often molested at this period by outlaws from the neighbouring fens. The parishes are fourteen, and the churches thirteen, in number; and the dissenters are numerous and respectable, having three commodious chapels, three of smaller size, and a Quaker's meeting-house, though none of that persuasion reside in the town. Cambridge is governed by a mayor, recorder, thirteen aldermen, twenty-four common council-men, and a town-clerk, and the town sends two members to parliament. The police is under the joint direction of the university and corporation, the vice-chancellor being always a magistrate ex officio. Fronting the shire-hall, in the market-place, stands Hobson's conduit, the gift of a celebrated horse jockey and carrier, in the reign of James I., whose conduct gave rise to the expression of Hobson's choice, 'that or none;' for in letting out his horses he strictly followed that rotation which gave each an equal share of work; and refused, it is said, to let any other than that which stood next. Near the gardens of Bene't College is a botanic garden of five acres, with a large house for the use of the governors, curator, &c., given to the University by the late Dr. Walker, and augmented by the benefaction of the late Dr. Betham.

The *University of Cambridge* consists of thirteen colleges and four halls, the latter enjoying equal privileges with the former. The remote antiquity that has been claimed for it need not here engage much attention. Sigebert, king of the East Angles in 630, was the first founder of whom any credible account remains; but few, or none, of the existing colleges were built or endowed until the thirteenth century. The following is the order of their foundation:—

Colleges or Halls.	Founders.	A. D.
St. Peter's, or Peter House	Hugo de Balsham	1257
Clare Hall	———	1326, 1342
Pembroke Hall	Mary de St. Paul	1343
Corpus Christi	———	1356
Gonville and Caius College	Edmund Gonville and Dr. Caius	1348, 1557
Trinity Hall	William Bateman, bishop of Norwich	1351
King's College	Henry VI. VII. and VIII.	1441
Queen's College	Margaret of Anjou	1448
Catherine Hall	Robert Woodlark	1474
Jesus College	John Alcock, bishop of Ely	1496
Christ College	Margaret, countess of Richmond	1506
St. John's College	The same	1511
Trinity College	Henry VIII.	1540
Magdalen College	Thomas, lord Audley	1542
Emanuel College	Sir Walter Mildmay	1584
Sidney Sussex College	Frances, countess of Sussex	1593
Downing College	Sir George Downing	1800

At the first foundation of these splendid schools there was no public provision, for the accommodation or maintenance of the scholars; but afterwards inns began to be erected by pious persons for their reception; and in the time of Edward I. colleges were regularly endowed. The university enjoys great privileges. It is governed by a chancellor, who is always a nobleman, and has a commissary under him, but may be changed every third year; a high steward, chosen by the senate; a vice-chancellor, chosen annually by the senate, out of two named by the heads of colleges from their own number; two proctors, chosen every year; and two taxers, who, with the proctors, regulate the weights and measures; two moderators, and two scrutators. The other officers are, a registrar or keeper of the archives, three esquire beadles, one yeoman beadle, the library-keepers, &c. There is also a commissary, who is usually appointed an assistant, or accessor, and deputy high-steward to the vice-chancellor in his court; and a public orator, who is the mouth of the university on public occasions, writes their letters, presents noblemen to their degrees with a speech, &c. The caput (which consists of the vice-chancellor, a doctor of divinity, a doctor of laws, a doctor of physic, a regent and non-regent master of arts, who are chosen yearly on the twelfth of October), are to consider and determine what graces are proper to be brought before the body of the university, and each of them has a negative voice. All graces must first pass the caput before they can be produced to the senate. Each college has its school and library, as at Oxford, of which those of Trinity and St. John are the most considerable. The senate of this university includes all the doctors and masters of arts, and is divided into two houses: the first consisting of regents, or those who have not been masters of arts five years, called white-hoods, from the lining of their hoods. The second are non-regents, or those who have taken the degree of master upwards of five years, but have not advanced to the degree of doctor; these are called black-hoods. The doctors under two years standing can vote only in the regent-house; but all others may vote in which house they please. In the senate-house the rejection of all officers, the appointment of the magistrates, and the admission to degrees, takes place; and no language but Latin is permitted to be spoken at its meetings. Besides the fellows and scholars, there are two other orders, called pensioners, the greater and the less; the former are the young nobility, and gentlemen of fortune, called fellow-commoners, because they dine with the fellows: the less are dieted with the scholars. There is also a considerable number of scholars of inferior fortune, called sizars: these, though not of the foundation, are capable of receiving many benefactions, called exhibitions, and frequently attain the highest honors. To particularise the buildings, and peculiar privileges, of each of the colleges in detail, will hardly be expected from us. We can only furnish the reader with a cursory glance at them.

St. Peter's College, or Peter House, was formerly two hostels, or hospitals, and appropriated in 1257, by Hugo de Balsham, prior of Ely, to the use of students. He endowed this foundation in 1214, for the support of a master, fourteen fellows, twenty-nine Bible clerks, and eight poor scholars; the number to be afterwards regulated by the fluctuation of the revenues. The fellowships have been since increased by numerous benefactions. The chapel was erected in 1632. The building surrounds two courts (the largest cased with stone), which are separated by a cloister and gallery. A lady Mary Ramsey is said to have once offered to leave a considerable property to St. Peter's, if it should be agreed to be called afterwards 'Peter and Mary's College.' Dr. Soame, the master, replied—, 'Peter hath been too long a bachelor to think of a companion in his old age.' 'A dear bought jest,' says Fuller, 'for lady Ramsey, disgusted at the refusal, turned the stream of her benevolence into a different channel.'

Clare Hall was erected on the former site of University Hall, a college founded in 1326 by Dr. Richard Baden. This being, about sixteen years after its erection, destroyed by fire, it was rebuilt on a more extended scale by Elizabeth de Burgh, in 1344; and she, being last heiress of the earls of Clare, gave to it its present name, with endowment for a master, ten fellows, and ten scholars. Richard III., Thomas Cecil, earl of Exeter, John Freeman, esq., William Butler, esq., and Samuel Blythe, esq., severally augmented the revenues, which now maintain seventeen fellows, and between thirty and forty scholars. This college, which stands near the north-west angle of King's College chapel, is more uniform in its buildings than most of its neighbours, and as pleasantly situated as any in the university. It was rebuilt of stone in 1638, except the chapel, which was erected in 1703, by Sir James Burroughs, at a cost of £7000. The alcove over the altar contains a fine painting of the Salutation, from the hand of Cipriani.

Pembroke Hall was founded in 1343, by Mary, Countess of Pembroke, and endowed by a charter of Edward III. for a master and six fellows. Henry VI. greatly enriched it. The number of fellowships is sixteen, and the scholarships about seventy. The chapel was built by bishop Wren, from a design of his nephew, Sir Christopher Wren. Here is a small detached building, con[illegible] [illegible]tronomical machine, or [illegible]y made by Dr. Roger [illegible]ted treatise on astro[illegible] [illegible]queathed the interest [illegible]eep 'the instrument [illegible]he college consists [illegible] hall, having at one [illegible]r. Long's sphere [illegible]nd will contain thir'y persons sitting conveniently. It contains meridians, a zodiac, several of the constellations painted on the ceiling, is penetrated by the poles, &c., but was never completed.

Corpus Christi, or *Bene't College*, was established by the union of two religious guilds, and patronised largely by Henry Plantagenet, duke of Lancaster, whom the brethren chose their first alderman. Sir John Cambridge and his son much increased its revenues, which were appropriated in 1356 to the maintenance of a master, eight fellows, six scholars, and three Bible clerks. Since that period the endowments have supported twelve fellows, and nearly sixty scholarships. The name of Bene't, or Benedict College, arose from its proximity to the church of that saint. Its greatest single benefactor was Matthew Parker, archbishop of Canterbury, who founded two fellowships and five scholarships, and bestowed on it the valuable library of Stoke-clare College, Suffolk, besides many valuable MSS. The buildings of this college also surround a square court. Dr. Herring, some years since archbishop of Canterbury, left £1000 towards its recent improvements, which consist of an entire new court, with a handsome Gothic front towards Trumpington street.

Gonville and Caius, called frequently King's College, was founded in the year 1348, by Edmund Gonville, and at first called Gonville Hall; but in 1557 Dr. John Caius, physician to Queen Mary, built a new court, and the three remarkable gates inscribed respectively, 'Humilitatis,' the gate of humility; 'Virtutis,' the gate of virtue; 'Is Caius posuit Sapientiæ' (John Caius built this in honour of wisdom); 'Honoriæ,' the gate of honor. Since the time of Dr. Caius the fellowships have increased to twenty-nine, and the scholarships to nearly 100. The principal court has been cased with stone and partly rebuilt. In the chapel is a tomb to the memory of Dr. Caius, with the following terse epitaph:--

FUI CAIUS

VIVIT POST FUNERA VIRTUS.

Trinity Hall was originally one of those hostels where the students resided at their own expense; and was appropriated by Richard Crowder, prior of Ely, in the reign of Henry III. Bateman, bishop of Norwich, converted it into a college in 1351, and provided for a master, three fellows, and two scholars: various benefactions have increased the fellowships to twelve, and the scholarships to fourteen. The hall is faced with stone, and the buildings are very neat and uniform. Among its modern benefactions is one of £20,000, left in 1747, by Dr. John Andrews, for the erection of two spacious wings.

King's College, founded by Henry VI. in 1441, is the pride of Cambridge. In 1443 he endowed it for a provost, seventy fellows or scholars, three chaplains, six clerks, sixteen choristers, and a music master, sixteen officers of the foundation, twelve servitors for the senior follows, and six poor scholars. All the designs of this munificent monarch, however were never completed, and but a small part of the intended buildings were erected Henry VII. may be

persons sitting conveniently. It contains
ians, a zodiac, several of the constellations
ed on the ceiling, is penetrated by the poles,
out was never completed.

with a handsome Gothic front towards
pington street.
nville and Caius, called frequently King's
ge, was founded in the year 1348, by
nd Gonville, and at first called Gonville
but in 1557 Dr. John Caius, physician to
Mary, built a new court, and the three
kable gates inscribed respectively, 'Hu-
tis,' the gate of humility; 'Virtutis,' the
of virtue; 'Is Caius posuit Sapientiæ'
Caius built this in honour of wisdom];
oriæ,' the gate of honor. Since the time of
Caius the fellowships have increased to
y-nine, and the scholarships to nearly 100
principal court has been cased with stone
artly rebuilt. In the chapel is a tomb to
emory of Dr. Caius, with the following
epitaph:--

Fui Caius

VIVIT POST FUNERA VIRTUS.

nity Hall was originally one of those
s where the students resided at their own
se; and was appropriated by Richard
ler, prior of Ely, in the reign of Henry
Bateman, bishop of Norwich, converted
a college in 1351, and provided for a
, three fellows, and two scholars: various
ctions have increased the fellowships to
, and the scholarships to fourteen. The
s faced with stone, and the buildings are
eat and uniform. Among its modern be-
ions is one of £20,000, left in 1747, by
ohn Andrews, for the erection of two spa-
wings.
g's College, founded by Henry VI. in
is the pride of Cambridge. In 1443
lowed it for a provost, seventy fellows or
rs, three chaplains, six clerks, sixteen
ters, and a music master, sixteen officers
foundation, twelve servitors for the senior
s, and six poor scholars. All the designs
munificent monarch, however were never
ed, and but a small part of the intended
ngs were erected Henry VII. may be

called its second founder. Towards the latter end of his reign he expended upwards of £2000 on its edifices, besides presenting the college with £5000 separately, for furnishing the chapel and provost's residence. In the chapel library is a plan of the college, as intended to be built by his predecessor. Some splendid additions have lately been made to this noble college.

King's College Chapel has been considered the most exact, as it is certainly one of the most beautiful specimens of Gothic architecture in Europe. The whole edifice is 316 feet in length, and eighty-four in breadth. Eleven immense buttresses support each side, and terminate in elegant pinnacles. On each corner is an octangular tower, 146½ feet high, and crowned with a noble dome. The open worked battlements give an airiness to its appearance, in fine contrast with the massive part of the structure. The interior is yet more striking; and its vast stone roof, unsupported by a single pillar, becomes an object of astonishment and awe to all who see it for the first time. It is in the form of a Gothic arch, flattened at the centre, and is divided into twelve parts, separated by the eleven principal arches, which spring from the buttresses. Each division of the roof is formed of groined arches, beautifully carved, and in the centre is one massy stone, of above a ton weight, ornamented with roses and portcullisses. The inside walls are wholly covered with numerous sculptured ornaments of almost inimitable workmanship. These represent the arms of the houses of York and Lancaster, with a number of crowns, roses, portcullisses, &c. Some of the supporters, cut in stone, display the hand of a master, and equal in expression almost any marble sculpture. On a panel, at the upper part of the screen which separates the anti-chape. from the choir, is a small piece in very bold relief, which is universally admired, representing the Almighty hurling the rebel angels from heaven; and on the altar-piece is a fine 'taking down from the cross,' which was presented by the Earl of Carlisle, and is supposed to be a production of Raphael. Its magnificent and exquisitely painted windows complete the enchantment of the inner scene. In the arrangement of the paintings, the subjects from the New Testament, on the north side, are all prior to the crucifixion of our Saviour; while those on the south side are posterior to that event; and the east window is devoted entirely to the most material circumstances immediately connected with that awful deed. This window is fifty-three feet high, and twenty-eight wide, and is separated by two elegant buttresses and a transom into six compartments. Each compartment contains one subject, and is divided by mullions into three lights.

Queen's College was founded in 1448, by Margaret of Anjou, consort of Henry VI., and endowed with £200 per annum for the support of a principal, and four fellows. Elizabeth Woodville, queen of Edward IV. was prevailed on by Andrew Ducket, the master, to complete its buildings, and establish it for a master, nineteen fellows, and forty-five scholars. She has since been celebrated annually, as the co-founder. The buildings surround two quadrangular courts, one of which has a cloister of about 330 feet. This stands on the east bank of the Cam, over which is a curious wooden bridge of one arch, supported by rustic abutments of stone.

Catharine Hall was founded by Woodlark, chancellor of the University, in 1474, and endowed for a master and three or more fellows. The number is now increased to five; and eight bye-fellowships with ten scholarships. The buildings occupy three sides of a square court, and are separated from the street by an iron palisade and an avenue of elms. Its west front, opposite Queen's, has a noble portico.

Jesus College, erected on the foundations of an ancient Benedictine nunnery, was founded by Alcock, Bishop of Ely, in 1496, for a master, six fellows, and six scholars. The endowments at present provide for sixteen fellows and fifty scholars. The college is at a short distance from the town, and the chapel is supposed to have been the ancient conventual church. A tomb of one of the nuns is still remaining, with the inscription,—

MORIBVS. ORNATA. JACET. HIC. BONA. BERTHA.
ROSATA.

It is said that a subterraneous passage exists from this college to Barnwell priory, about a mile distant.

Christ's College, built on the site of an hostel, called God's House, and founded by Henry VI., was endowed, in 1506, by Margaret, countess of Richmond and Derby. The establishment now maintains a master, fifteen fellows, and seventy scholars. The buildings enclose a small quadrangular court, behind which is a modern structure by Inigo Jones. In the gardens is shown a mulberry tree, which Milton planted when a student here.

St. John's College, built on the site of the hospital of St. John's, in 1511, and finished in 1516, was endowed by Margaret countess of Richmond, for a master and thirty-one fellows; but its benefactors have raised a revenue to support sixty-one fellows and 114 scholars. The buildings are of brick, and surround three courts. A new court, surrounded by magnificent buildings, in the Gothic style, has recently been formed on the opposite side of the river, towards the fields; these are probably the most splendid of the new erections in the University. The entrance court from the town has a magnificent portal and four towers. On the other side of a brook, which bounds the walks of the college, are the remains of an ancient and spacious building, called Pythagoras' School, belonging with some houses and several acres of land to Merton College, Oxford. Its walls are strengthened with buttresses, supporting arches of the Saxon style; the building is otherwise devoid of ornament, except one window on each side, which has a pillar in the centre, with a decorated capital with a round moulding. This is supposed to have been the place where the first tutors of the university delivered their lectures.

Magdalen College.—This foundation of Stafford, duke of Buckingham, was confiscated at his death; and, being afterwards obtained from the king, was endowed by Thomas, lord Audley, for a master and four fellows. The latter have since been increased to seventeen, and several scholarships have been added. This college is of brick, and surrounds two courts. The library contains the books and MSS. of Samuel Pepys, esq., secretary to the Admiralty, in the reigns of Charles II. and his successor. The chapel has a curious plaster of Paris altar-piece.

Trinity, the largest college of the university, surrounds two noble quadrangular courts, whose gateways, chapel, and library are fine specimens of architecture. It was founded, in 1546, by Henry VIII., on the site of two other colleges and a hostel, and originally endowed for a master, sixty fellows, sixty-seven scholars, four conducts, three public professors, thirteen poor scholars, twenty beadsmen, and other officers; the number on the establishment has amounted to upwards of 400, of late. The inner court, called after the name of Dr. Thomas Neville, was chiefly built at his expense, in the year 1609. On its west side is the library, a capacious building, 200 feet in length, forty in breadth, and thirty-eight high. Beneath is a spacious piazza, which opens to the river and gardens. On the south side of this court another has been lately built, containing numerous sets of rooms for students. The chapel contains a fine statue of Sir Isaac Newton, by Roubiliac. He is represented in a loose gown of a master of arts, with a prism in his hands. His countenance is turned upwards, with a look of profound meditation, and on the pedestal is the inscription, Qui genus humanum ingenio superavit. The drapery and features are considered extremely beautiful. No object in the university deserves a visitor's notice more than the library of this college. It is a superb apartment, occupying one side of the quadrangle called Neville's court. The books are all ranged on either side, and the compartments crowned with busts of ancient and modern authors.

Emanuel College, founded in 1584 by Sir Walter Mildmay, on the site of a Dominican convent, was endowed for a master, three fellows, and four scholars. Additional donations have provided for the support of fifteen fellows, and nearly 100 scholars and exhibitionists. The hall is thought one of the most elegant in Cambridge; and the altar-piece in the chapel is very fine.

Sidney Sussex College was founded by Frances Sidney, countess of Sussex, who by will bequeathed upwards of £5000 towards a college for a master, ten fellows, and twenty scholars. The first stone of the college was laid on the 20th of May, in 1596, and the building completed in 1599. The chapel and the library were rebuilt recently. The foundation now provides for seven fellows, ten bye-fellows, twenty scholars, and twenty-four bye-scholars, besides a mathematical lecturer, and the exhibitioners.

Downing College, the last of these noble establishments, was originally provided for by the will of Sir George Downing, who died in 1717; but, the bequest being disputed, the great seal was not affixed to its charter until the year 1800. This provides for a master, a professor of English law, a professor of medicine, and sixteen fellows. The latter are to vacate the fellowships at the expiration of twelve years, unless they obtain a licence to hold them longer.

The Senate-House, in the centre of the town, is a noble building of the Corinthian order, designed by Sir James Burrows. It forms the north side of the quadrangle, of which the public schools and library are designed to be the western side. The gallery, supported by fluted columns, is said to be capable of containing 1100 persons; and the whole room, within, is considered the most superb in Europe. It contains statues of George I. and II., the duke of Somerset, by Rysbrach, &c. The schools surround a small court. On the west are the philosophy schools, where disputations are held. On the north the divinity school; and on the left, or south entrance of the court, that of law and physic. At the south-east corner of the philosophy schools is a geometrical staircase, leading to the university library, which occupies the quadrangular apartments above the schools. The original building was erected about the year 1480. The east front, containing the new library, was rebuilt in 1775. Members of the senate, and all bachelors of law and physic, are entitled to have books from this library at any time (not exceeding ten volumes). The statue of Ceres, brought from the temple at Eleusis, by Dr. Clarke, graces the vestibule. The pedestal was designed by Flaxman, from the original in the temple of Minerva Polias at Athens. Here is also (brought from Athens by the same gentleman) the column placed on the tomb of Euclid of Megara, the disciple of Socrates, with an inscription in bas relief. The library contains upwards of 90,000 volumes, besides various curious MSS. The libraries of the several colleges are also rich in MSS., missals, pictures, and curious natural productions and remains, which it is impossible here to particularise.

The University of Cambridge is, on the whole, elegant rather than magnificent. It possesses princely revenues, and many fine specimens of the arts. Its recent improvements, in several of the colleges, have added greatly to its utility and splendour. Its walks and gardens, as scenes for retirement and study, are no where surpassed. But it forms no consistent whole; it has grown under the separate designs of its architects and founders into a splendid collection of disjointed buildings, which would be the noble ornaments of separate towns, but a mind that can comprehend the whole always regrets that there was no presiding design for it. The best apology for this is the plain fact of the case—like every thing characteristic of our country, it has been the creature of necessity and utility rather than of theory and art. This university sends two members to parliament, independently of the two for the town of Cambridge.

Cambridge, a post town of the United States, in South Carolina, capital of the district of Ninety-Six. It is situated in Abbeville county, eighty miles W.N.W. of Columbia, 165 north-west of Charlestown, and fifty north by west of Augusta in Georgia. A district court is held on the 26th of April and November, and a county court for Abbeville county March 25th and September 12th. It is 745 miles from Philadelphia.

Cambridge, one of the largest and most flourishing towns of Middlesex County, Massachusetts, is agreeably situated on the north side of Charles River, over which a bridge has been erected, connecting it with Boston. It contains, besides Harvard university, about 100 dwellings

IBRIDGE, a post town of the United States,
ith Carolina, capital of the district of
-Six. It is situated in Abbeville county,
miles W.N.W. of Columbia, 165 north-
f Charlestown, and fifty north by west of
a in Georgia. A district court is held on
th of April and November, and a county
or Abbeville county March 25th and Sep-
12th. It is 745 miles from Philadelphia.
BRIDGE, one of the largest and most
ing towns of Middlesex County, Massa-
s, is agreeably situated on the north side
les River, over which a bridge has been
, connecting it with *Boston*. It contains,
Harvard university, about 100 dwellings

congregational and episcopalian churches, and a court house. The university which is considered the most respectable in the united States, consists of several large, spacious brick edifices. Harvard hall is divided into six apartments, one of which is appropriated for the library, two for the philosophical apparatus, one for the museum, a fifth for a refectory, and the other for a chapel. The library contains upwards of 20,000 volumes. The philosophical apparatus has cost nearly £1500, and is one of the completest on the American continent. This university was first instituted in 1636, and was no more than an academic free-school; two years after, in consequence of a donation left it by the Rev. Mr. Harvard of Charlestown, who died there, it was named Harvard College. In 1650 its first charter was obtained from the government of Massachusetts; and in the mean time it received several donations from learned men in Europe. Dr. Lettsom of London was amongst the most distinguished and liberal of these contributors. The governor, lieutenant-governor, the council and senate, the president of the university, and the congregational ministers of the six adjoining towns, are, during office, overseers of the university. The corporation is a distinct body, in whom is vested the property of the university. The number of those who had been admitted to academical degrees, from its first establishment, to July, 1793, was 3360. The usual number of resident students, is from 200 to 250. A supreme court is held here, the last Tuesday in October, and a court of common pleas the last Tuesday in November. It is 350 miles from Philadelphia. Long. 70° 45′ W., lat. 42° 25′ N.

CAMBRIDGE, the chief town of Dorchester county, eastern shore of Maryland. It is situated on the south side of Choptank river, about fifteen miles from its mouth; the river is here nearly two miles wide. It contains about fifty houses, a church, and 300 inhabitants. The situation of the town is healthy and agreeable. It is eighteen miles north-west by west of Vienna, thirty-seven south of Easton, and 152 S.S.W. of Philadelphia. Long. 0° 59′ W., lat. 38° 34′ N.

CAMBRIDGE MANUSCRIPT, a copy of the Gospels and Acts of the Apostles in Greek and Latin. Beza found it in the monastery of Ireneus at Lyons in 1562, and gave it to the university of Cambridge in 1582. It is a quarto, and written on vellum; sixty-six leaves of it are much torn and mutilated, and ten of these are supplied by a later transcriber. Beza conjectures that this MS. might have been written so early as the time of Irenæus. Wetstein apprehends that it either returned or was first brought from Egypt into France; that it is the same copy which Druthmar, an ancient expositor, who lived about A. D. 840, had seen, and which, he observes, was ascribed to St. Hilary; and that R. Stephens had given a particular account of it in his edition of the New Testament in 1550. It is sometimes called Stevens's Second Manuscript. Mill agrees with F. Simon, that it was written in the western part of the world by a Latin scribe, and that it is to a great degree interpolated and corrupted: he observes, that it agrees so much with the Latin Vulgate as to afford reason for concluding that it was corrected or formed upon a corrupt and faulty copy of that translation. From this and the Clermont copy of St. Paul's epistles, Beza published his larger Annotations in 1582.

CAMBRIDGESHIRE is an inland county of England, about fifty miles long and twenty-five miles broad, bounded on the north by Lincolnshire, on the east by Norfolk and Suffolk, on the south by Essex and Herts, and on the west by Bedford and Huntingdonshire. It was included in the ancient territory of the Iceni, and after the Roman conquest was the third province of Flavia Cæsariensis. During the Saxon heptarchy it belonged to the kingdom of the East Angles. Its hundreds are Armingford, Chesterton, Cheveley, Chilford, Flendish, Lougstow, Northstow, Papworth, Redfield, Staine, Staplow, Triplow, Wetherley, Whittlesford, and the Isle of Ely; the latter being under a palatinate jurisdiction pertaining to the see of Ely. In this see is the whole county, with the exception of a small part belonging to that of Norwich. Cambridgeshire contains the city of Ely, nine market towns, viz. Cambridge, Caxton, Linton, March, Newmarket, Soham, Thorney, Wisbeach, and Royston, and 164 parishes.

The county is in general flat and little diversified with engaging prospects; the whole of its northern part is occupied more or less by the fens of the Isle of Ely, penetrated in all directions by drains, and in various stages of redemption from their former swampy state. Here is the great Bedford Level, as it is called, containing 400,000 acres of land; and the towns and villages that are scattered over the surface of the country present their spires and buildings like the towns of a flat island on the ocean, or of an oasis in the African desert; and are to be seen for many miles around. The climate is very different in different parts; in the neighbourhood of the fens it is considered unhealthy and aguish, in the southern parts of the county it is dry and more wholesome. But the most foggy parts have undergone a great melioration of climate of late years, and the same persevering efforts that have redeemed a most promising soil from waste, and given to it the abundant wheat-crops with which it is now crowned, have dissipated the damps and vapors that generated disease. The only rivers of this county are the Cam or Granta, the Nene and the Ouse. The Cambridgeshire canal begins with the Ouse at Harrimere, and runs to Cambridge; the Wisbeach canal joins the Wisbeach river at the old sluice of that town, and opens a communication between this county and Norfolk and Suffolk. The Gogmagog hills, the highest in the county, begin about four miles to the south-east of Cambridge, and form one of the terminations of the range of chalk hills that commence in the south-west of England. Along the district from hence to Newmarket the country is bleak, and inhabited but thinly. Chalk, clunch, as it is called, silt, gault, sand, peat, and gravel, are the substrata of this county. The clunch is a species of limestone. The gault is a blue clay, pertaining to the fenny districts; where also the silt, a fine sea-sand, and peat, are found in great abundance.

Cambridgeshire is chiefly an arable county. Wheat and oats are grown largely in the northern, and barley in the southern, parts. Coleseed also occupies a considerable portion, it has been said a fourth, of the fen lands. It is generally eaten green with sheep. Hemp, flax, mustard-seed, and osiers are also grown largely in this district. The turf is very valuable in some parts; and the garden produce on the borders of the fens is abundant. The breeds of sheep are the Norfolk, west country, and Cambridgeshire; and a cross breed of the Leicester and Lincoln. The farmers also pride themselves much on their large black cart horses.

Cambridgeshire is little distinguished by its manufactures. Oil-mills, for crushing seed and making oil-cake, were once sources of considerable trade at Wisbeach, and still are found at Whittlesford and Sawston; at the last place is also a respectable paper manufactory. Malt is made in considerable quantities in the north-west of the county, and a coarse pottery, together with excellent white bricks, at Ely, Chatteris, and Cambridge.

One of the oldest and most complete specimens of Saxon architecture in this kingdom is found in the conventual church of Ely. It was erected in king Edgar's reign. The two transepts of the cathedral are celebrated specimens of the massy Norman style; the whole of that edifice, indeed, is very interesting to the antiquary. See Ely. Near Chesterton are vestiges of a square Roman camp, called Harborough, or Arbury. Three parts of the vallum remain, and enclose nearly six acres of ground, in which various coins have been discovered; one of which had the head of Rome on one side, and Castor and Pollux on horseback on the other. About four miles to the east of Cambridge, on the Gogmagog hills, are the remains of a circular fort or camp, which has three ramparts and two grafts. It is about 246 paces in diameter, enclosing thirteen acres and a half of land. Some antiquaries have supposed that it was erected by the British as a check to the Romans at Harborough. Southward is a Roman highway. When a road was making from March to Wisbeach, in 1730, three urns were discovered full of burnt bones and ashes, and a pot containing 300 pieces of silver coin, of all the emperors from Vespasian to Antoninus Pius.

No county of England has exhibited more decided improvements in its general appearance than some parts of the county of Cambridge, of late years: none, on the other hand, has experienced more fluctuations in the value of property, and the rise and fall of agricultural produce. The only mansion in the county worth particular notice is Wimpole, the seat of the earl of Hardwicke. It is a spacious brick structure, with noble wings, that have been added since its erection; the east wing is connected with the offices, and the west with a large greenhoure. The entrance is by a double flight of steps. The interior of the fabric is elegant, and has been much improved by the present earl. It is three miles from Caxton.

CAMBYSES, king of Persia, son of Cyrus the Great. He conquered Egypt, and, after having been beaten in some skirmish with the Ethiopians, he found, on returning to Memphis, the Egyptians rejoicing on having found their god Apis, which so provoked him, that he killed their god, and plundered their temples. When he attacked Pelusium, he placed at the head of his army a number of cats and dogs; and the Egyptians refusing to kill animals which they reverenced as divinities, became an easy prey. Cambyses afterwards sent an army of 50,000 men to destroy Jupiter Ammon's temple, but it was overwhelmed by the sands. He next resolved to attack the Carthaginians and Ethiopians. He killed his brother Smerdis from mere suspicion, and flayed alive a partial judge, whose skin he nailed on the judgment seat, and appointed his son to succeed him, telling him to remember where he sat. He died of a small wound he had given himself with his sword as he mounted on horseback, A.C. 521.; and the Egyptians observed, that it was the same place on which he had wounded their god Apis, and that therefore he was visited by the hand of the gods. A short time before his death, having been reproved by one of his courtiers in the most delicate manner for his intemperance, he shot the censurer's son to the heart with an arrow, and then asked the father if he had not a steady hand, though intoxicated.

CAMCHATKA. See Kamtschatka.

CAMDEN, a county of the United States, in Edenton district, North Carolina; bounded north by the state of Virginia, south-west and west by Pasquotank river, which separates it from Pasquotank county, and east by Currituck. The chief town is Jonesborough.

Camden, a district of South Carolina, bounded on the north-east by Cheraws, south-east by George-town, north by the state of North Carolina, north-west by Pinkney, west by Ninety-Six, south-west by Orangeburgh, and south by Charleston district. It is eighty-two miles from north to south, and sixty from east to west, and is divided into the following counties, viz. Fairfield, Richland, Lancaster, Kershaw, Clermont, Clarendon, and Salem. It is watered by the Catabaw, which passes nearly through the middle of it. In the north part of the district are the Catabaw Indians; the only tribe which resides in the state. See Catabaw. The upper part of this district is diversified with hills, the soil in general rich, and the country well watered. It produces good crops of Indian corn, wheat, rye, barley, tobacco, cotton, &c.

Camden, a post town of South Carolina, and capital of the district. It is situated in Kershaw county, on the east side of the Wateree, 120 miles north by west of Charleston. It has a court house, jail, and Episcopalian church. It is situated on a large navigable river, and carries on a brisk trade with the back counties. A district court is held here on the 26th of April and November. A battle was fought at this town on the 16th August, 1780, between general Gates and lord Cornwallis; in which the Ame-

been much improved by the present earl
three miles from Caxton.
AMBYSES, king of Persia, son of Cyrus

ty, on the east side of the Wateree, 120
north by west of Charleston. It has a
house, jail, and Episcopalian church. It
tuated on a large navigable river, and
es on a brisk trade with the back counties
strict court is held here on the 26th of April
November. A battle was fought at this
on the 16th August, 1780, between gene
ates and lord Cornwallis, in which the Ame-

ricans were defeated. Another was fought, on the 25th April, 1791, between lord Rawdon and general Greene, who was encamped within a mile of the town. The Americans had 126 killed, and 100 taken prisoners. The English had about 100 killed. The 13th of May following the British evacuated and burnt the town. See America. It is thirty-five miles north-east of Columbia, and 626 south-west by south of Philadelphia. Lon. 5° 23′ W., lat. 34° 17′ N.

Camden (William), the great antiquary, was born in London in 1551. His father was a native of Litchfield, and his mother was of the ancient family of Curwens in Cumberland. He was educated at Christ's hospital, and St. Paul's school; and from thence sent, in 1566, to Oxford, and entered servitor of Magdalen College; but, being disappointed of a demy's place, he removed to Broadgate hall, and two years after, to Christ Church, where he was supported by his friend Dr. Thornton. About this time he was a candidate for the fellowship of All-souls College, but lost it by the intrigues of the Popish party. In 1570, he supplicated the regents of the university to be admitted B. A. but in this also he miscarried. The following year he came to London, where he prosecuted his favorite study of antiquity, under Dr. Goodman, dean of Westminster, by whose interest he was made second master of Westminster school, in 1575. Between his leaving the university and this period, he took several journeys to different parts of England, to collect materials for his Britannia, in which he was now deeply engaged. In 1581 he became intimately acquainted with the learned president Brisson, who was then in England; and in 1586 he published the first edition of his Britannia, dedicated to lord Burleigh; and such was its reception, that eight editions of it were published in four years, and another in 1594. The title is Britannia, sive Florentissimorum Regnorum Angliæ, Scotiæ, Hiberniæ, et Insularum Adjacentium, ex intima Antiquitate, Chorographica Descriptio. In 1593 he succeeded to the head master of Westminster school. In 1597 he published his Greek grammar, and was appointed Clarencieux king at arms. In 1600 he made a tour as far as Carlisle, accompanied by his friend, Mr. (afterwards Sir Robert) Cotton. In 1606 he began his correspondence with De Thou, which continued to the death of that historian. In 1607 he published his last edition of the Britannia, which is that from which the English translations have been made; and in 1608 he began to digest his materials for a history of the reign of queen Elizabeth. In 1609, after recovering from a dangerous illness, he retired to Chislehurst in Kent, where he continued to spend the summer during the remainder of his life. The first part of his annals of the queen did not appear till 1615, and he determined that the second volume should not appear till after his death. The reign of queen Elizabeth was so recent when his first volume was published, that many of the persons concerned, or their dependents, were still living. It is no wonder, therefore, that the historian should offend those whose actions would not bear enquiry. Some of his enemies were clamorous and troublesome; which determined him not to publish the second volume during his life; but he deposited one copy in the Cottonian library, and transmitted another to his friend Dupuy at Paris. It was first printed at Leyden in 1625. The MS. was entirely finished in 1617; and from that time he was principally employed in collecting more materials for the further improvement of his Britannia. In 1622, being now upwards of seventy, and finding his health declining, he determined to execute his design of founding an history lecture in the university of Oxford. His deed of gift was accordingly transmitted by his friend Mr. Heather, to Mr. Wheare, who was, by himself, appointed his first professor. He died at Chislehurst, in 1623, in the seventy third year of his age; and was buried in Westminster Abbey, where a monument of white marble was erected to his memory.

CAM'EL, *n.*
Cam'el-backed,
Cam'el-driver.
Camel'opard.
} Arab. *qumel*, *boogumelon*, *gimel*; Heb. *gamal*, *καμηλος*; Lat. *camelus*, a large animal; common in Asia and Africa. The one sort is large, and full of flesh, and fit to carry burdens of a thousand pounds weight, having one bunch upon its back. The other have two bunches upon their backs, like a natural saddle, and are fit either for burdens, or men to ride on. A third kind is leaner, and of a smaller size, called dromedaries, because of their swiftness, which are generally used for riding by men of quality. The camelopard (Lat. *camelus* and *pardus*) is an Abyssinian animal, taller than an elephant, but not so thick. He is so named, because he has a neck and head like a camel; he is spotted like a pard, but his spots are white upon a red ground. The Italians call him giraffa. See Camelus.

Woo to you scribis and farisees ypocritis,—blynde lederis, clensynge a gnatte, but swolowynge a *camel*.

Wickliff's New Test. Matt. 23.

Camels have large solid feet, but not hard. *Camels* will continue ten or twelve days without eating or drinking, and keep water a long time in their stomach, for their refreshment. *Calmet.*

In silent horrour o'er the boundless waste,
The driver, Hassan, with his *camels* past:
One cruise of water on his back he bore,
And his light scrip contained a scanty store;
A fan of painted feathers in his hand
To guard his shaded face from scorching sand.

Collins' Eclogue, ii.

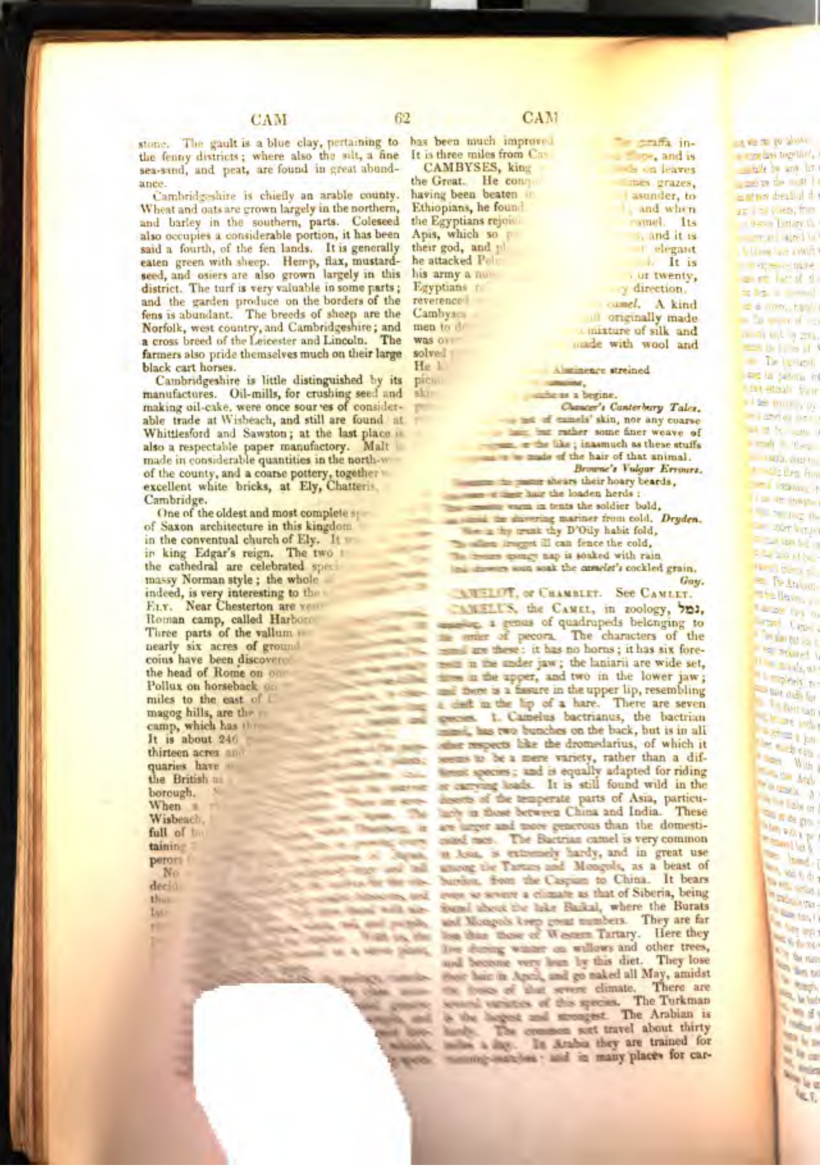
Patient of thirst and toil,
Son of the desart! even the *camel* feels,
Shot through his withered heart, the fiery blast.

Thomson.

The stomach of the *camel* is well known to contain large quantities of water, and to retain it unchanged for a considerable length of time. This properly qualifies it for living in the desert.

Paley's Natural Theology.

Camel, in mechanics, a kind of machine used in Holland for lifting ships, in order to bring them over the Pampus, at the mouth of the river Y, where the shallowness of the water hinders large ships from passing. It is also used in other places, particularly at the dock of Petersburgh, the vessels built there being, in



stone. The gault is a blue clay, pertaining to the fenny districts; where also the silt, a fine sea-sand, and peat, are found in great abundance.

Cambridgeshire is chiefly an arable county. Wheat and oats are grown largely in the northern, and barley in the southern, parts. Coleseed also occupies a considerable portion, it has been said a fourth, of the fen lands. It is generally eaten green with sheep. Hemp, flax, mustard-seed, and osiers are also grown largely in this district. The turf is very valuable in some parts; and the garden produce on the borders of the fens is abundant. The breeds of sheep are the Norfolk, west country, and Cambridgeshire; and a cross breed of the Leicester and Lincoln. The farmers also pride themselves much on their large black cart horses.

Cambridgeshire is little distinguished by its manufactures. Oil-mills, for crushing seed and making oil-cake, were once sources of considerable trade at Wisbeach, and still are found at Whittlesford and Sawston; at the last place is also a respectable paper manufactory. Malt is made in considerable quantities in the north-w[illegible] of the county, and a coarse pottery, together [illegible] excellent white bricks, at Ely, Chatteris, [illegible] Cambridge.

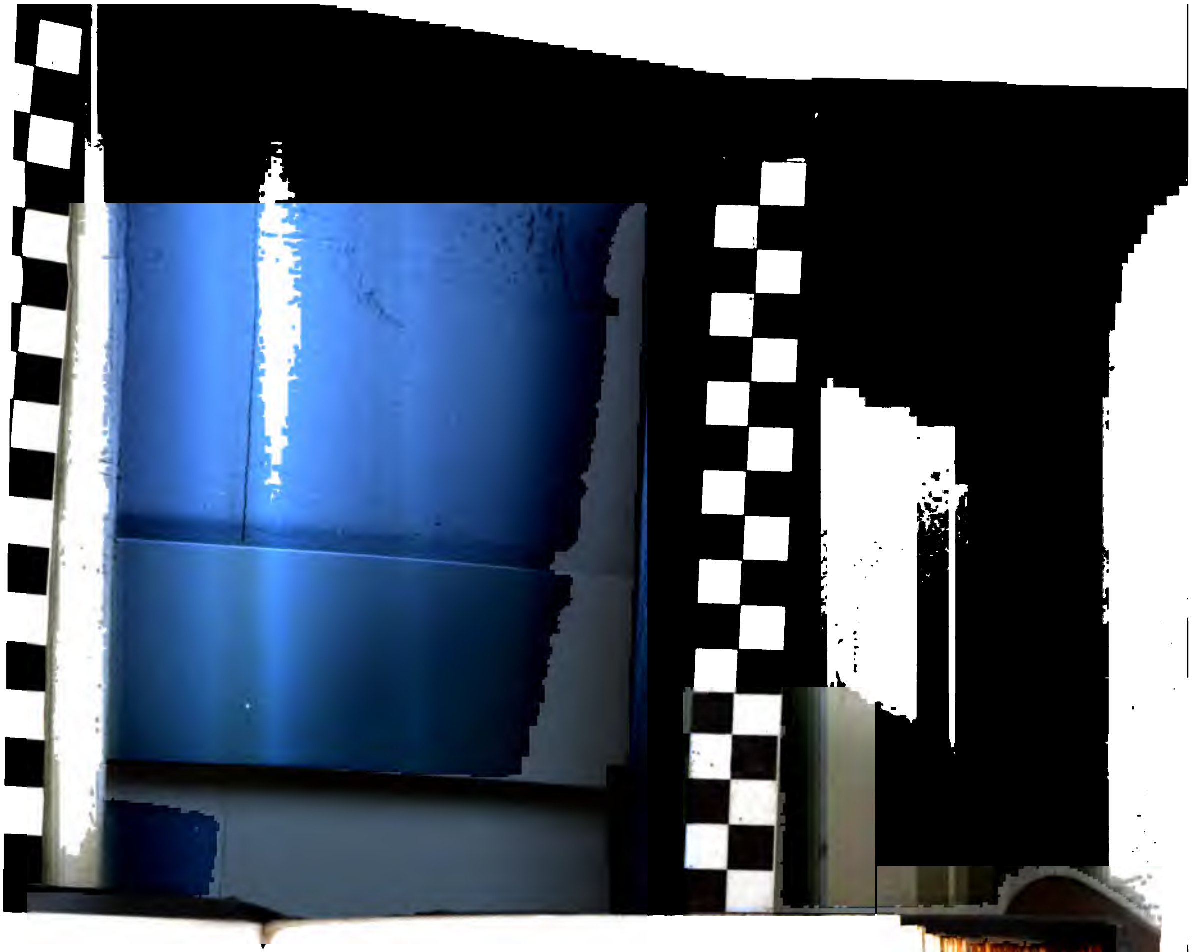
[illegible], or CHAMBLET. See CAMLET.

[illegible], the CAMEL, in zoology, גמל, [illegible] a genus of quadrupeds belonging to [illegible] order of pecora. The characters of the [illegible] are these: it has no horns; it has six fore-[illegible] in the under jaw; the laniarii are wide set, [illegible] in the upper, and two in the lower jaw; and there is a fissure in the upper lip, resembling a cleft in the lip of a hare. There are seven species. 1. Camelus bactrianus, the bactrian camel, has two bunches on the back, but is in all other respects like the dromedarius, of which it seems to be a mere variety, rather than a different species; and is equally adapted for riding or carrying loads. It is still found wild in the deserts of the temperate parts of Asia, particularly in those between China and India. These are larger and more generous than the domesticated race. The Bactrian camel is very common in Asia, is extremely hardy, and in great use among the Tartars and Mongols, as a beast of burden, from the Caspian to China. It bears even so severe a climate as that of Siberia, being found about the lake Baikal, where the Burats and Mongols keep great numbers. They are far less than those of Western Tartary. Here they live during winter on willows and other trees, and become very lean by this diet. They lose their hair in April, and go naked all May, amidst the frosts of that severe climate. There are several varieties of this species. The Turkman is the largest and strongest. The Arabian is hardy. The common sort travel about thirty miles a day. In Arabia they are trained for running-matches; and in many places for car-



een much improved by the pre

abstaining from drinking enable
over unwatered tracts for many
requiring the least liquid; and
under hunger is such that they
travel many days fed only with a few dates,
some small balls of bean or barley-meal, or
on the miserable thorny plants they meet with in the deserts. The Arabians regard the camel as a present from Heaven, a sacred animal, without whose assistance they could neither carry on trade, nor travel. Camel's milk is their common food. They also eat its flesh, that of the young camel being reckoned highly savory. Of the hair of those animals, which is fine and soft, and which is completely renewed every year, the Arabians make stuffs for clothes, and other furniture. With their camels, they not only want nothing, but have nothing to fear. In one day, they can perform a journey of fifty leagues into the desert, which cuts off every approach from their enemies. With a view to his predatory expeditions, the Arab instructs, rears, and exercises his camels. A few days after their birth, he folds their limbs under their belly, forces them to remain on the ground, and, in this situation, loads them with a pretty heavy weight, which is never removed but for the purpose of replacing a greater. Instead of allowing them to feed at pleasure, and to drink when they are dry, he begins with regulating their meals, and makes them gradually travel long journeys, diminishing, at the same time, the quantity of their aliment. When they acquire some strength, they are trained to the course. He excites their emulation by the example of horses, and, in time, renders them more robust. After he is certain of the strength, fleetness, and sobriety of his camels, he loads them with his own and their food, sets off with them, reaches unperceived the confines of the desert, robs the first passengers he meets, pillages the solitary houses, loads his camels with the booty, and, if pursued, accelerates his retreat. On these occasions he unfolds his own talents and those of the camels. He mounts one of the fleetest, conducts the troop, and makes them travel night and day, almost without either stopping, eating, or drinking; and, in this manner, he easily performs a journey of 900 miles in eight days. During this period of fatigue, they are perpetually loaded, and he allows them each day, one hour only of repose, and a ball of paste. They often run thus nine or ten days, without drink; and when, by chance, there is a pool at some distance, they scent the water half a league off. Thirst makes them double their pace, and they drink as much at once as serves them for the future as well as the past; for their journeys often last several weeks, and their abstinence continues an equal time. Of all carriages, that by camels is the cheapest and most expeditious. The merchants and other passengers unite in a caravan, to prevent the insults and robberies of the Arabs. These caravans are often very numerous, and are always composed of more camels than men. Each camel is loaded in proportion to his strength; and, when overloaded, he refuses to march, and continues lying till his burden is lightened. The large camels generally carry 1000 or 1200 pounds weight, and the smallest from 600 to 700. In these commercial travels, their march is not hastened; as the route is often 700 or 800 leagues, their motions and journeys are regulated. They walk only, and perform from about ten to twelve leagues each day. Every night they are unloaded, and allowed to pasture at freedom. When in a rich country, or fertile meadow, they eat, in less than an hour, as much as serves them to ruminate the whole night, and to nourish them twenty-four hours. But they seldom meet with such pastures; neither is this delicate food necessary for them. They even seem to prefer wormwood, thistles, nettles, broom cassia, and other prickly vegetables, to the softest herbage. As long as they find plants to browse they easily dispense with drink. This facility of abstaining long from drink proceeds not, however, from habit alone, but is rather an effect of their structure. Independent of the four stomachs, which are common to ruminating animals, the camels have a fifth bag, which serves them as a reservoir for water. This fifth stomach is peculiar to the camel. It is so large as to contain a vast quantity of fluid, where it remains without corrupting, or mixing with other aliments. When the animal is pressed with thirst, and has occasion for water to macerate his dry food in ruminating, he makes part of this water mount into his paunch, or even as high as the œsophagus, by a simple contraction of certain muscles. It is by this singular construction that the camel is enabled to pass several days without drinking, and to take at a time a prodigious quantity of water. Travellers, when much oppressed with drought, are sometimes obliged to kill their camels in order to have a supply of drink from these reservoirs. These inoffensive creatures must suffer much; for they utter the most lamentable cries, especially when overloaded. But though perpetually oppressed, their fortitude is equal to their docility. At the first signal, they bend their knees and lie down to be loaded.

As soon as they are loaded, they rise spontaneously, and without any assistance. One of them is mounted by their conductor, who goes before, and regulates the march of all the followers. They require neither whip nor spur. But, when they begin to be tired, their courage is said to be supported, or rather their fatigue is charmed, by singing, or by the sound of some instrument. Their conductors relieve each other in singing; and, when they want to prolong the journey, they give the animals but one hour's rest, after which, resuming their song, they proceed on their march for several hours more, and the singing is continued till they arrive at another resting place, when the camels again lie down; and their loads, by unloosing the ropes, are allowed to glide off on each side of the animals. Thus they sleep on their bellies in the middle of their baggage, which, next morning, is fixed on their backs with equal quickness and facility as it had been detached the evening before. One male only is left for eight or ten females; and the laboring camels are generally geldings. They are unquestionably weaker than unmutilated males; but are more tractable, and always ready for service; while the former are not only unmanageable, but almost furious, during the rutting season, which lasts forty days, and returns annually in the spring. They then foam continually, and one or two red vesicles, as large as a hog's bladder, issue from their mouths. In this season they eat little, and attack and bite animals, and even their own masters, to whom at all other times they are very submissive. The time of gestation is near twelve months; and like all large quadrupeds, the female brings forth only one at a birth. Her milk is copious and thick; and when mixed with a large quantity of water, affords an excellent nourishment to men. The females are not obliged to labor, but are allowed to pasture and produce at full liberty. The advantage derived from their produce and their milk is perhaps superior to what could be drawn from their working. In some places, however, most of the females are castrated, to fit them for labor; and it is alleged, that this operation, instead of diminishing augments their vigor and plumpness. In general, the fatter camels are, the more they are capable of enduring fatigue. During long journeys, in which their conductor is obliged to husband their food, and when they often suffer much hunger and thirst, their bunches gradually diminish, and become so flat, that the place where they were is only perceptible by the length of the hair, which is always longer on these parts than on the rest of the back. The meagreness of the body augments in proportion as the bunches decrease. The Moors, who transport all articles of merchandise from Barbary and Numidia, as far as Ethiopia, set out with their camels well laden, which are very fat and vigorous; and bring back the same animals so meagre that they commonly are sold at a low price to the Arabs of the desert, to be again fattened. Ancient authors assert, that camels are in a condition for propagating at the age of three years; but this is doubtful, for, in three years, they have not acquired one-half their growth. The young camel sucks twelve months, but, when meant to be trained, to render him strong and robust in the chase, he is allowed to suck and pasture at freedom during the first year, and is not loaded or made to perform any labor till he is four year old. He generally lives forty and sometimes fifty years, which duration of life is proportioned to the time of his growth. Considering, under one point of view, all the qualities of this animal, and all the advantages derived from him, it must be acknowleged, that he is the most useful creature subjected to the service of man. Gold and silk constitute not the true riches of the East. The camel is the genuine treasure of Asia. 2. Camelus dromedarius, the Arabian camel, with one bunch or protuberance on the back. It has four callous protuberances on the fore legs, and two on the hind ones. This species is common in Africa, and the warmer parts of Asia. It is a common beast of burden in Egypt, and along the countries which border on the Mediterranean Sea; in Morocco, Sahara, or the Desert, and Ethiopia; but nowhere south of those kingdoms. In Asia it is equally common in Turkey or Arabia; but scarcely seen farther north than Persia, being too tender to bear a more severe climate. India is destitute of this animal. 3. Camelus glama, or llama, the South American camel sheep, has an almost even black, small head, fine black eyes, and very long neck bending much, and very protuberant near the junction with the body; in a tame state, with smooth short hair; in a wild state, with long coarse hair, white, gray, and russet, disposed in spots; with a black line from the head along the top of the back to the tail, and belly white. The tail is short; the height from four to four feet and a half; the length from the neck to the tail, six feet. In general the shape exactly resembles a camel, only it wants the dorsal bunch. It is the camel of Peru and Chili; and, before the arrival of the Spaniards, was the only beast of burden known to the Indians. It is very mild, gentle, and tractable. Before the introduction of mules, they were used by the Indians to plough the land: at present they serve to carry burdens of about 100lbs. They lie down to the burden; and when wearied no blows can provoke them to go on, and nothing but caresses can make them arise. Their flesh is eaten, and is said to be as good as mutton. The wool has a strong disagreeable scent. They are very surefooted, and are, therefore, used to carry the Peruvian ores over the ruggedest hills and narrowest paths of the Andes. They inhabit that vast chain of mountains through their whole length to the straits of Magellan; but, except where these hills approach the sea, as in Patagonia, never appear on the coasts. Like the camel, they have powers of abstaining long from drink, sometimes for four or five days; like that animal, their food is coarse. In a wild state they keep in great herds in the highest and steepest parts of the hills; and while they are feeding, one keeps sentry on the pinnacle of some rock: if it perceives the approach of any one it neighs; the herd take the alarm, and go off with incredible speed. They outrun all dogs: there is no way of killing them but with the gun. They are killed for the sake of their flesh and hair; for the Indians weave the last into cloth. The huanaco, the arcucanus, and the vicuna, so nearly resemble this animal, that they by no means merit a separate description.

4. Camelus pacos, or the sheep of Chili, has no bunch on its back. It is covered with a fine valuable wool, which is of a rose red color on the back of the animal, and white on the belly. They are of the same nature with the llama, inhabit the same places, but are more capable of supporting the rigor of frost and snow; they live in vast herds, are very timid, and excessively swift. The Indians take the pacos in a strange manner; they tie cords with bits of cloth or wool hanging on them, about three or four feet from the ground, across the narrow passes of the mountains, then drive those animals towards them, which are so terrified by the flutter of the rags that, huddling together, they give the hunters an opportunity to kill with their slings as many as they please. The tame ones will carry from fifty to seventy-five pounds, but are kept principally for the sake of the wool and the flesh, the latter of which is exceedingly well tasted.

Camelus, in zoology, a species of trichoda, found in vegetable infusions. This is thickish, hairy before, and emarginate on each side in the middle.

Camelus, in entomology, a species of scarabæus; thorax four-horned; shield bicornuted behind; body black. Inhabits Germany.

CAMEO. See Camaieu.

CAMERA Æolia, a contrivance for blowing the fire for the fusion of ores, without bellows, by means of water falling through a funnel into a close vessel, which sends from it so much air as continually blows the fire if there be the space of another vessel for it to expatiate in by the way, as it there lets fall its humidity. See Blowing Machine.

Camera Lucida, a contrivance of Dr. Hook for making the image of any thing appear on a wall in a light room, either by day or night. Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there be a high window with a casement opened. At a convenient distance, to prevent its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the picture be transparent, reflect the sun's rays by means of a looking-glass, so as that they may pass through it towards the place of representation; and to prevent any rays from passing aside it, let the picture be encompassed with some board or cloth. If the object be a statue, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation put a broad convex glass, ground to such a convexity as that it may represent the object distinctly in such place. The nearer this is situated to the object the more will the image be magnified on the wall, and the further the less; such diversity depending on the difference of the spheres of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situated at suitable distances, easily found by trial, to make the representations erect. The whole apparatus of object-glasses, &c. with the person employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room, and the operation itself will be easily performed.

Camera Lucida is also the name of an instrument for taking views, invented by Dr. Wollaston in 1807. We shall copy his own description of this ingenious invention.

'While I look directly down at a sheet of paper on my table, if I hold between my eye and the paper a piece of plane glass, inclined from me downwards at an angle of 45°, I see by reflection the view that is before me, in the same direction that I see my paper through the glass. I might then take a sketch of it; but the position of the object would be reversed.

To obtain a direct view it is necessary to have two reflections. The transparent glass must for this purpose be inclined to the perpendicular line of sight only the half of 45°, that it may reflect the view a second time from a piece of looking-glass placed beneath it, and inclined upwards at an equal angle. The objects now appear as if seen through the paper in the same place as before; but they are direct instead being inverted, and they may be discerned in this manner sufficiently well for determining the principal positions.

The pencil, however, and any object which it is to trace, cannot both be seen distinctly in the same state of the eye, on account of the difference of their distances; and the efforts of successive adaptation of the eye, to one or the other, would become painful if frequently repeated. In order to remedy this inconvenience, the paper and pencil may be viewed through a convex lens of such a focus as to require no more effort than is necessary for seeing the distant objects distinctly. These will then appear to correspond with the paper in distance as well as direction, and may be drawn with facility, and with any desired degree of precision.

This arrangement of glasses will probably be best understood from inspection of plate II., fig. 1., *a b* is the transparent glass; *b c* the lower reflector; *b d* a convex lens (of twelve inches focus); *e* the position of the eye; and *f g h e* the course of the rays.

In some cases a different construction will be preferable. Those eyes, which without assistance are adapted to seeing near objects alone, will not admit the use of a convex glass; but will, on the contrary, require one that is concave to be placed in front, to render the distant objects distinct. The frame for a glass of this construction is represented at *i k*, fig. 3, turning upon the same hinge at *h*, with a convex glass in the frame *l m*, and moving in such a manner, that either of the glasses may be turned alone into its place, as may be necessary to suit an eye that is long or short sighted. Those persons, however, whose sight is nearly perfect, may at pleasure use either of the glasses.

The instrument represented in that figure differs, moreover, in other respects from the foregoing, which I have chosen to describe first, because the action of the reflectors there employed would be more generally understood. But those who are conversant with the science of optics will perceive the advantage that may be derived in this instance from prismatic reflection; for when a ray of light has entered a solid piece of glass, and falls from within upon any surface, at an inclination of only twenty-two or twenty-three degrees, as above supposed, the refractive power of the glass is such as to suffer none of that light to pass out, and the surface becomes in this case the most brilliant reflector that can be employed.

Fig. 2. represents the section of a solid prismatic piece of glass, within which both the reflections requisite are effected at the surfaces ab, bc, in such a manner that the ray fg, after being reflected first at g, and again at h, arrives at the eye in a direction he at right angles to fg.

There is another circumstance in this construction necessary to be attended to, and which remains to be explained. Where the reflection was produced by a piece of plane glass, it is obvious that any objects behind the glass, if sufficiently illuminated, might be seen through the glass as well as the reflected image. But when the prismatic reflector is employed, since no light can be transmitted directly through it, the eye must be so placed that only a part of its pupil may be intercepted by the edge of the prism, as at e, fig. 2. The distant objects will then be seen by this portion of the eye, while the paper and pencil are seen past the edge of the prism by the remainder of the pupil.

In order to avoid the inconvenience that might arise from an unintentional motion of the eye, the relative quantities of light to be received from the object, and from the paper, are regulated by a small hole in a piece of brass, which by moving on a centre at c, fig. 3., is capable of adjustment to every inequality of light that is likely to occur.

Since the size of the whole instrument, from being so near the eye, does not require to be large, I have, on many accounts, preferred the smallest size that could be executed with correctness, and have had it constructed on such a scale, that the lenses are only three-fourths of an inch in diameter.

Though the original design and principal use of this instrument is to facilitate the delineation of objects in true perspective, yet this is by no means the sole purpose to which it is adapted; for the same arrangement of reflectors may be employed with equal advantage for copying what has been already drawn, and may thus assist a learner in acquiring at least a correct outline of any subject.

For this purpose, the drawing to be copied should be placed as nearly as may be at the same distance before the instrument that the paper is beneath the eye-hole; for in that case the size will be the same, and no lens will be necessary, either to the object or to the pencil.

By a proper use of the same instrument, every purpose of the pentagraph may also be answered, as a painting may be reduced in any proportion required, by placing it at a distance in due proportion, greater than that of the paper from the instrument. In this case a lens becomes requisite for enabling the eye to see at two unequal distances with equal distinctness; and in order that one lens may suit for all these purposes, there is an advantage in carrying the height of the stand according to the proportion in which the reduction is to be effected.

The principles upon which the height of the stem is adjusted will be readily understood by those who are accustomed to optical considerations. For as in taking a perspective view, the rays from the paper are rendered parallel, by placing a lens at the distance of its principal focus from the paper, because the rays received from the distant objects are parallel; so also when the object seen by reflection is at so short a distance that the rays received from it are, in a certain degree, divergent, the rays from the paper should be made to have the same degree of divergency, in order that the paper may be seen distinctly by the same eye; and for this purpose, the lens must be placed at a distance less than its principal focus. The stem of the instrument is accordingly marked at certain distances, to which the conjugate foci are in the several proportions of two, three, four, &c. to one; so that distinct vision may be obtained in all cases, by placing the painting proportionably more distant.

By transposing the convex lens to the front of the instrument, and reversing the proportional distances, the artist might also enlarge his smaller sketches with every desirable degree of correctness, and the naturalist might delineate minute objects in any degree magnified.

Since the primary intention of this instrument is already, in some measure, answered by the camera obscura, a comparison will naturally be made between them.

The objections to the camera obscura are,

1st. That it is too large to be carried about with convenience.

The camera lucida is as small and portable as can be wished.

2dly, In the former, all objects that are not situated near the centre of view are more or less distorted.

In this there is no distortion; so that every line, even the most remote from the centre of view, is as straight as those through the centre.

3dly, In that the field of view does not extend beyond 30°, or at most 35° with distinctness.

But in the camera lucida as much as 70° or 80° might be included in one view.

It is obvious, that the preceding contrivance may be applied to a telescope, for the purpose of taking sketches of the different objects that may be contained within the field of view; but as it is only a small portion of a landscape, or of any large object, that can be seen at once through a telescope, it would be desirable to have some contrivance by which the objects seen in different fields of view, and sketched upon the same piece of paper, might be all connected with each other into one landscape. This, however, can be done only to a certain extent, as will appear from plate II. fig. 4. Let A B be the direction of the telescope, which, when placed upon a suitable stand, can be moved round the axis O in a horizontal plane, $B\,b\,b'$; B, the extremity of the eye-tube at which the prism of the camera lucida is fixed; M N, the paper lying in a horizontal po-

t one lens may suit for all these purposes, there
an advantage in carrying the height of th
id according to the proportion in which the
uction is to be effected.
The principles upon which the height of the
m is adjusted will be readily understood by
se who are accustomed to optical considera-
ns. For as in taking a perspective view, the
s from the paper are rendered parallel, by
cing a lens at the distance of its principal
us from the paper, because the rays received
m the distant objects are parallel; so also
en the object seen by reflection is at so short
listance that the rays received from it are, in a
tain degree, divergent, the rays from the
per should be made to have the same degree
divergency, in order that the paper may be
m distinctly by the same eye; and for this
rpose, the lens must be placed at a distance
s than its principal focus. The stem of the
strument is accordingly marked at certain dis-
nces, to which the conjugate foci are in the
veral proportions of two, three, four, &c. to
ie; so that distinct vision may be obtained in
l cases, by placing the painting proportionably
ore distant.
By transposing the convex lens to the front of
e instrument, and reversing the proportional
stances, the artist might also enlarge his smaller
etches with every desirable degree of correct-
ss, and the naturalist might delineate minute
jects in any degree magnified.
Since the primary intention of this instrument
already, in some measure, answered by the
amera obscura, a comparison will naturally be
ade between them.
The objections to the camera obscura are,
1st. That it is too large to be carried about
ith convenience.
The camera lucida is as small and portable as
an be wished.
2dly, In the former, all objects that are not
ituated near the centre of view are more or less
istorted.
In this there is no distortion; so that every
ine, even the most remote from the centre of
iew, is as straight as those through the centre.
3dly, In that the field of view does not extend
eyond 30°, or at most 35° with distinctness.
But in the camera lucida as much as 70° or 80°
night be included in one view.
It is obvious, that the preceding contrivance
nay be applied to a telescope, for the purpose of
aking sketches of the different objects that may
e contained within the field of view; but as it
s only a small portion of a landscape, or of any
arge object, that can be seen at once through a
elescope, it would be desirable to have some
ontrivance by which the objects seen in different
ields of view, and sketched upon the same piece
f paper, might be all connected with each other
nto one landscape. This, however, can be done
nly to a certain extent, as will appear from
late II. fig. 4. Let A B be the direction of the
elescope, which, when placed upon a suitable
tand, can be moved round the axis O in a hori-
ontal plane, B b b′; B, the extremity of the eye-
ube at which the prism of the camera lucida is
ixed; M N, the paper lying in a horizontal po-

sition; and a b, a′ b′, successive positions of the telescope in a plane parallel to M N. Let E F be the field of view of the telescope, when seen on the paper by reflection from the prism; then the instrument must be so constructed, that when the telescope is in the position a b, and directed to the part of the landscape immediately adjacent to that which is contained in the field E F, the field of view F G, when seen by reflection from the prism, must be in contact with E F. When this happens we have B b = C c, and the angle B F b = E B F the angle subtended by the field of view; but it is obvious, that when the telescope is moved from the position A B into the position a b, its angular motion round O, viz. the angle B O b, is equal to an angle comprehended by the field of view, that is, to the angle B F E; therefore, in the triangles O B b, B F b, we have the angles at O and F equal, and the side B b common; and consequently the side O B is equal to the side B C. From this it follows, that, in order to have the successive fields of view, E F, F G, G H, all joined to each other, or at their proper relative distances, the distance of the eye from the paper must be equal to its distance from the centre of motion O, round which the telescope revolves. The telescope should therefore be placed upon a stand, so constructed that the centre of motion, O, may be placed in different positions between the eye-piece and the object-glass; by which means, the observer may vary the distance of the paper from his eye, according as he wishes to have his drawing on a large or a small scale. By the instrument, when thus constructed, we are enabled to take a connected panoramic view of any horizontal zone of a landscape, whose breadth does not exceed the field of view of the telescope. The objects contained in the different fields of view, will be arranged in a circle whose diameter is equal to the distance of the eye from the centre of motion.

This instrument is admirably fitted for taking a correct outline of the visible horizon, with all the various indentations with which that line is generally broken by the intervention of valleys and mountains. Unless the horizon is extremely and unusually contracted, the field of view of a common telescope will contain a zone which will easily comprehend every depression and elevation; and even when the place of the observer is embosomed in an amphitheatre of mountains which rise around him with various elevations, the field of view may be enlarged by diminishing the magnifying power of the telescope. For this purpose, the micrometrical telescope, invented by Dr. Brewster, is particularly applicable, as the magnifying power can be increased or diminished without changing any of the lenses; and as the distance between the eye and the centre of motion, O, can be altered, even though the telescope is fixed to its stand. The micrometrical telescope having also the properties of a compound microscope, any long object which cannot be contained in the field of view, in the direction of its length, may be delineated in a similar manner. This contrivance cannot be applied to the common compound microscope, as it has not a motion round an axis.

The camera lucida of Dr. Wollaston might be fitted up with a horizontal motion, and without the aid of a telescope, so as to delineate one continued zone of a landscape; but when the objects are small, or at a considerable distance, a telescope becomes indispensably necessary. See the *Philosophical Magazine*, vol. xxvii. p. 343; *Nicholson's Journal*, vol. xvii. p. 1., vol. xxiii. p. 372, vol. xxiv. p. 146; and *Brewster's Treatise on New Philosophical Instruments*, Edinb. 1812, book i. p. 11, book iii. p. 133, and book vi.

Camera Obscura, Latin, the dark chamber, an optical machine, used in a darkened chamber, so that the light coming only through a double convex glass, objects exposed to day-light, and opposite to the glass, are represented inverted upon any white matter placed in the focus of the glass. It was invented by Baptista Porta. It affords very diverting spectacles, both by exhibiting images perfectly like their objects, and each clothed in its native colors, and by expressing, at the same time, all their motions; which latter no other art can imitate. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy and justness. See Optics.

CAM'ERADE, *n. s.* Lat from *camera*, chamber. One that lodges in the same chamber; a bosom companion. By corruption we now use comrade.

Camerades with him, and confederates in his design. *Rymer.*

CAMERARIA, in botany: a genus of the monogynia order, and pentandria class of plants; natural order, thirtieth, contortæ: cor. contorta; two horizontal follicles at the base of the seed-case, and the seeds are inserted into a proper membrane. There are four species; the principal are 1 C. angustifolia has an irregular shrubby stalk, which rises about eight feet, sending out many branches, garnished with very narrow thin leaves, placed opposite, at each joint. The flowers are produced scatteringly at the end of the branches, which are shaped like those of the latifolia, but smaller. It is a native of Jamaica. 2. C. latifolia, a native of the island of Cuba. It rises with a shrubby stalk to ten or twelve feet, dividing into several branches, garnished with roundish pointed leaves placed opposite. The flowers are produced at the end of branches in loose clusters, which have long tubes enlarging gradually upward, and at the top are cut into five segments, broad at the base, but ending in sharp points; the flower is of a yellowish white color. Both these plants abound with an acrid milky juice like the spurge. They are propagated by seeds, which must be procured from the places of their growth. They may also be produced by cuttings planted in a hot-bed during summer: they must have a bark stove for they are very tender, but in warm weather they must have plenty of air.

CAMERARIUS (Joachim), one of the most learned writers of his time, was born in 1500, at Bamberg, in Franconia. He embraced the reformation very early, and formed a close friendship with Melancthon, whose life he wrote. On the establishment of a college at Nuremburg, Camerarius was made professor of belles lettres. He afterwards removed to Leipsic to superintend the university, where he died in 1575. He translated into Latin, Herodotus, Demosthenes, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret, Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek Epistles; Accounts of his Journeys, in Latin verse; a Commentary on Plautus; the Lives of Helius Eobanus Hessus, and Philip Melancthon, &c.

CA'MERATED, *adj*. Lat. *cameratus*, arched; roofed slopewise.

CAM'ERATION, *n. s.* Lat. *cameratio*; a vaulting or arching.

CAMERLINGO, denotes the cardinal who governs the ecclesiastical state, and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal camerlingo publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and twelve prelates, called clerks of the chamber.

CAMERON (John), one of the most famous divines among the Protestants of France, in the seventeenth century, was born at Glasgow, in 1580, where he taught the Greek tongue; and having read lectures upon that language for about a year, travelled, and became professor and minister at Bourdeaux, Sedan, and Saumur, at which last place he broached his doctrine of grace and free will, which was framed by Amyraut, Cappel, Bochart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. He published, 1. Theological Lectures; 2. Icon Johannis Cameronis; and some miscellaneous pieces. He died in 1625, aged sixty.

CAMERON (Richard), the founder of the Scots Cameronians, was a famous field-preacher, who, refusing to accept the indulgence to tender consciences, granted by king Charles II., thinking such an acceptance an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a defection from his brethren, and even headed a rebellion, in which he was killed.

CAMERONIANS, a sect in Scotland, who separated from the Presbyterians in 1666, and continued long to hold their religious assemblies in the fields. The Cameronians took their denomination from Richard Cameron. They were never entirely reduced till the Revolution, when they voluntarily submitted to king William. The Cameronians adhere rigidly to the form of government established in 1648. They are also called Cargillites, from another of their preachers. There are not, it is said, above fourteen or fifteen congregations among them, and those not large.

CAMERONITES, a party of Calvinists in France, who asserted that the will of man is only determined by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind They were so named from professor John Cameron. They are a sort of mitigated Calvinists, and approach to the opinion of the Arminians.

CAMES, a name given to the small slender rods of cast lead, of which the glaziers make their turned lead. The lead being cast into slender rods of twelve or fourteen inches long each, is called the came; sometimes also they call each of these rods a came, which, being afterwards drawn through their vice, makes their turned lead.

CAMILLA, queen of the Volsci, daughter of Metablus and Camilla, was educated in the woods, inured to the labors of hunting, and fed upon the milk of mares. Her father devoted her, when young, to the service of Diana. When she was declared queen, she marched at the head of an army, accompanied by three youthful females like herself, to assist Turnus against Æneas, where she signalised herself by the numbers that perished by her hand.

CAMILLA, in entomology, an European species of papilio, the P. rivularis of Scopoli, and P. lucilla of Esper. The wings of this species are indented, black, and glossed with blue, with a white band and spot on each side; posterior wings beneath at the base silvery and immaculate.

CAMILLÆ, and **CAMILLI**, in antiquity, girls and boys who ministered in the sacrifices of the gods; and especially those who attended the flamen dialis, or priest of Jupiter. The word seems borrowed from the language of the ancient Etrurians, where it signified minister, and was changed from casmillus.

CAMILLUS (Furius), an illustrious hero of the Roman republic. He triumphed four times was five times dictator, and was justly honored with the title of the second founder of Rome. Lucius Apuleius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, the Gauls sacked Rome; but instead of rejoicing at the punishment of his ungrateful countrymen, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost strictness the law of Rome, in refusing to accept the command, which several private persons offered him. The Romans, who were besieged in the Capitol, created him dictator, A. A. C. 363; in which office he acted with so much bravery and conduct, that he entirely drove the Gauls out of the territories of the commonwealth. He died A. A. C. 385, aged 81. He conquered the Hernici, Volsci, Latini, and Etrurians, and dissuaded his countrymen from their intention of leaving Rome to reside at Veii. When he besieged Falisci, he rejected, with proper indignation, the offers of a schoolmaster, who had betrayed into his hands the sons of the most worthy citizens.

CAMINA, or **YERVA CAMINA**, in botany, an American herb, the same with what is otherwise called Paraguay tea, or yerva conpallo. See ILEX.

CAMINISTIQUIA, in geography, a river of Upper Canada, which discharges itself into the lake Superior, thirty miles east of the Grand Portage.

CAMION, in the military art, a small cart with three wheels, for carrying pullets, &c.

CAMISA'DO, *n.* } From *camisa*, a shirt. A
Cam'isated, *adj.* } nocturnal assault, wherein the soldiers wear shirts over their armour, to know their own company from the enemy, lest they should in the dark kill of their own company instead of the enemy.

> For I this day will lead the forlorn hope,
> The *camisado* shall be given by me.
> *Old Play. Four Prentices of London.*

> They had appointed the same night, whose darkness would have encreased the fear, to have given a *camisado* upon the English. *Hayward.*

CAMISARDS, a name given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms in their own defence in 1688.

CAMLET, or Camblet, a kind of stuff made of goats' hair, with wool or silk: in some, the warp is silk and wool twisted together, and the woof hair. The true, or oriental camlet is made of the pure hair of a sort of goat, frequent about Angora; all the inhabitants whereof are employed in the manufacture and commerce of camlets. Mention is made in writers of the middle age, of stuffs made of camels' hair, under the denominations of cameletum and camelinum, whence probably the origin of the term; but these are represented as strangely coarse, rough, and prickly, and seem to have been chiefly used among the monks by way of mortification, as the hair shirt of later times. We have no camlets made in Europe of the goats' hair alone; even at Brussels, they add a mixture of woollen thread. England, France, Holland, and Flanders, are the chief places of this manufacture. Brussels exceeds them all in the beauty and quality of its camlets: those of England are reputed the second.

Camlets, Figured, are those of one color, whereon are stamped various figures, flowers, foliage, &c., by means of hot irons, which are a kind of moulds, passed together with the stuff, under a press. These are chiefly brought from Amiens and Flanders; the commerce of these was anciently much more considerable than at present.

Camlets, Watered, those which, after weaving, receive a certain preparation with water; and are afterwards passed under a hot press, which gives them a smoothness and lustre.

Camlets, Waved, are those whereon waves are impressed, as on tabbinets; by means of a calender, under which they are passed and repassed several times. The manufacturers, &c. of camlets ought to take care they do not acquire any needless plaits; it being almost impossible to get them out again. This is notorious, even to a proverb: we say, a person is like camlet, he has taken his plait.

CAMMA, a province of Loango in Africa, the inhabitants of which are continually at war with those of Gobbi, another province of Loango. See Gobbi. The weapons they formerly used in their wars were the short pike, bows and arrows, sword and dagger; but since the Europeans have become acquainted with that coast, they have supplied them with fire-arms.

CAM'MOCK, *n. s.* Sax. cammoc; Lat. *ononis*. An herb; the same with petty whin, or rest-harrow, as this herb is always called, though the proper name seems to be wrest-harrow, from its strong roots resting the harrow aside.

CAMOENS (Lewis De), a famous Portuguese poet, the honor of whose birth is claimed by different cities. But according to N. Antonia and Manuel Correa, his intimate friend, he was born at Lisbon in 1517. His family was of considerable note, and originally Spanish. The elder branch of it, according to Castera, intermarried with the blood royal of Portugal. But the younger branch had the superior honor to produce the author of the Lusiad. The misfortunes of the poet began early. In his infancy, Simon Vaz de Camoens, his father, being commander of a vessel, was shipwrecked at Goa, where, with his life, the greatest part of his fortune was lost. His mother, however, Anne de Macedo of Santaren, provided for the education of her son Lewis at the university of Coimbra. What he acquired there his works discover; an intimacy with the classics, equal to that of Scaliger, but directed by the taste of a Milton or a Pope. When he left the university, he appeared at court. He was handsome; had sparkling eyes; with the finest complexion; and was a polished scholar; which, added to the natural vivacity of his disposition, rendered him an accomplished gentleman. Courts are the scenes of intrigue; and intrigue was fashionable at Lisbon. But the particulars of the amours of Camoens are unknown. Only this appears; he aspired above his rank, for he was banished from court; and in several of his sonnets he ascribes his misfortunes to love. He now retired to his mother's friends at Santaren. Here he renewed his studies, and began his poem on the discovery of India. John III. at this time prepared an armament against Africa. Camoens, tired of his inactive obscure life, went to Ceuta in this expedition, and displayed his valor in several rencounters. In a naval engagement with the Moors in the straits of Gibraltar, in the conflict of boarding, he was among the foremost, and lost his right eye. Yet neither the hurry of actual service nor the dissipation of the camp could stifle his genius. He continued his Lusiad, and several of his most beautiful sonnets were written in Africa, while, as he expressed it,

> 'One hand the pen, and one the sword, employed.'

The fame of his valor had now reached the court, and he obtained permission to return to Lisbon. But, while he solicited an establishment which he had merited in battle, the malignity of evil tongues was injuriously poured upon him. Though the bloom of his youth was effaced by long residence under the scorching sun-beams of Africa, and disfigured by the loss of an eye, his presence gave uneasiness to some gentlemen of families of the first rank, where he had formerly visited. Jealousy is the characteristic of the Spanish and Portuguese; its resentment knows no bounds, and Camoens now found it prudent to banish himself from his native country. Accordingly, in 1553, he sailed for India, with a resolution never to return. As the ship left the Tagus, he exclaimed in the words of the sepulchral monument of Scipio Africanus, Ingrata patria, non possedebis ossa mea! 'Ungrateful country, thou shalt not possess my bones!' But he knew not what evils in the East would awake the remembrance of his native fields. When Camoens arrived in India, a fleet was ready to sail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery. In 1554 he attended Vasconcello in an expedition to the Red Sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined to the fleet or camp. He visited Mount Felix, and the adjacent inhospitable regions of Africa, which he so strongly pictures in the Lusiad, and in one of his little pieces, where he laments the absence of his mistress. When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his Epic. But this serenity was interrupted, perhaps by his own imprudence. He wrote some satires which gave offence; and, by order of the viceroy, Francisco Barreto, he was banished to China. The accomplishments of Camoens soon found him friends, even under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao. Here he continued his Lusiad; and here also, after five years residence, he acquired a fortune equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulf near the mouth of the river Mehon on the coast of China. All he had acquired was lost; as he tells us in the seventh Lusiad:

> 'Now blest with all the wealth fond hope could
> crave,
> Soon I beheld that wealth beneath the wave
> For ever lost;——
> My life like Judah's heaven-doom'd king of yore,
> By miracle prolong'd.'——

His poems, which he held in one hand, while he cut the waves with the other, were all that he possessed, when he stood friendless on the unknown shore. But the natives gave him a most humane reception; which he has immortalised in that beautiful prophetic song in the tenth Lusiad. On the banks of the Mehon, he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, admitted him into intimate friendship, and Camoens was happy till count Rodondo assumed the government. But now, those who had formerly procured his banishment, exerted all their arts against him. Rodondo, when he entered on office, pretended to be the friend of Camoens, yet, he soon after suffered him to be thrown into the common prison. Camoens, however, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy. But Camoens had some creditors, who detained him in prison a considerable time, till the gentlemen of Goa, ashamed that a man of his singular merit should experience such treatment among them, set him at liberty. He again assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, who was appointed governor of the fort at Sofala, allured the poet by high promises to attend him thither. Though the only motive of Barreto was to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But to prevent this, the governor ungenerously charged him with a debt for board. Anthony de Cabra however, and Hector de Silveira, paid the demand; and 'Camoens,' says Faria, 'and the honor of Barreto were sold together.' After an absence of sixteen years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his Lusiad, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to king Sebastian, then in his eighteenth year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar. Though Henry was the great patron of one species of literature, yet the author of the Lusiad was utterly neglected by him, and under his inglorious reign, died in all the misery of poverty. By some, it is said, he died in an almshouse. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, saved his master's life in the shipwreck, begged in the streets of Lisbon, for the only man in Portugal on whom God had bestowed those talents, which tend to elevate the spirit of a degenerate age. To the eye of a careful observer, the fate of Camoens throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same despicable spirit, which suffered Camoens to depend on alms, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: 'Em fim accaberey à vida,'

&c. 'I am ending the course of my life; the world will witness how I have loved my country. I have returned, not only to die in her bosom, but to die with her.' In this unhappy situation, in 1579, in his sixty-second year, the year after the fatal defeat of Don Sebastian, died Lewis de Camoens, the greatest literary genius ever produced in Portugal; a man equal in martial courage and honor to her greatest heroes. And he was buried in a manner suitable to the poverty in which he died. The Lusiad has been translated once into Latin, twice into Italian, once into French, four times into Spanish, and once into English, by Mr. Mickle. Some of his minor poems have been translated into English, in beautiful, if not very faithful, language, by lord Strangford.

CAM'OMILE, *n. s.* A flower. See ANTHEMIS.

CAMORTA, one of the Nicobar isles, in the Bay of Bengal, on which the Danes had a settlement during the last century. It is about twenty-nine miles in length from north to south, and five miles broad. On the south-east coast is a good harbour. It is covered in parts with the poon tree, used for masts in India, and has even fruitful spots, but is thinly peopled. See NICOBAR.

CA'MOS, or
CA'MOYS, or
CA'MOUS, *adj.*
CA'MOUSED, *adj.*
CA'MOUSLY.

Fr. *camuser*; Lat. *simus*; Ital. *camuso*. Flat nosed; to bend; to break; to flatten the nose; from *καμπτω*, I bend. Dr. Johnson says, that camow-nosed is hook-nosed.

Round was his face, and *camuse* was his nose;
As pilled as an ape was his skull.
Chaucer's Canterbury Tales.

Many Spaniards, of the race of Barbary Moors, though after frequent commixture, have not worn out the *camous* nose unto this day.
Browne's Vulgar Errours.

CAMOUFLET, in military affairs, a kind of stinking combustible blown out of paper cases into the miners' faces, when they are at work in the galleries of the countermines. They are to be ranked at present, not only among the disused, but we hope among the never to be renewed resources of a weak garrison.

CAMP', *v.* & *n.*
CAMPAIGN',
CAMP'-FIGHT,
CAMP'-MASTER.

Sax. *camp*, corresponds with Lat. *castrum*, from Goth. *kiamp*, a soldier; Swed. *kamp*; Sax. *camp*; Arm. *kimp*; Welsh, *camp*; Irish, *campa*; Ital. *campo*; Fr. *camp*. A contest, or place of armies; a military station in the field. The root of the Goth. word is *kapp*, a contest; from which we have our word *cope*, to contend. Its general acceptation is the place and order of tents for soldiers in the field. It has also a signification that has nothing to do with the pomp and circumstance of glorious war; it often means no more than a field, plain, or open country. Campaign is equally applied to an extensive level country, and to the season that armies keep the field.

From *camp* to *camp*, through the foul womb of night,
The hum of either army stilly sounds. *Shakspeare.*
I, his despiteful Juno, sent him forth,
From courtly friends, with *camping* foes to live. *Id.*

For their trial by *camp-fight*, the accuser was, with the peril of his own body, to prove the accused guilty; and, by offering him his glove or gantlet, to challenge him to this trial. *Hakewell.*

This might have hastened his march, which would have made a fair conclusion of the *campaign.*
Clarendon.

In countries thinly inhabited, and especially in vast *campanias*, there are few cities, besides what grow by the residence of kings. *Temple.*

Command the children of Israel, that they put out of the *camp* every leper, and overy one that hath an issue, and whosoever is defiled by the dead: Both male and female shall ye put out, without the *camp* shall ye put them; that they defile not their *camps* in the midst whereof I dwell. *Numb.* v. 2—4.

What hindered me from going into Spain? That was my province, where I should have had the less dreaded Asdrubal, not Hannibal, to deal with. But hearing, as I passed along the coast of Gaul, of this enemy's march, I landed my troops, sent the horse forward, and pitched my *camp* upon the Rhone. A part of my cavalry encountered, and defeated that of the enemy. *Hooke's Speech of Scipio.*

I served thee fifteen hard *campaigns*,
And pitched thy standard in these foreign fields;
By me thy greatness grew; thy years grew with it—
But thy ingratitude out-grew them both. *Dryden.*

Those grateful groves that shade the plain,
Where Tiber rolls majestic to the main,
And fattens, as he runs, the fair *campaign*. *Garth.*

An Iliad rising out of one *campaign*. *Addison.*
Next, to secure our *camp* and naval powers,
Raise an embattled wall with lofty towers. *Pope.*

And perfect victor had the duke remained,
But that Prince Hubert privately retired,
And long before the *camp* at Brescia gained,
Whence he returned with double fury fired. *Gay.*

On Addison's sweet lays, Attention waits,
And Silence guards the place while he repeats;
His muse alike on every subject charms,
Whether she paints the god of love or arms;
In him pathetic Ovid sings again,
And Homer's Iliad shines in his *campaign*. *Id.*

'Not far from hence,' said he, 'a chosen few
Lie *camped*, my trusty followers in the field. *Id.*

On the banks of the Niester, the prudent Athanaric, more attentive to his own than to the general safety, had fixed the *camp* of the Visigoths, with the firm resolution of opposing the victorious barbarians, whom he thought it less advisible to provoke.
Gibbon.

What though I saw with steady view
Bath spread of nymphs her proud array;
And faced, with anguish well concealed,
The shafts that frequent round me flew;
Think not that from the fatal field
I bore a heart entire away!
Nor yet, believe me, thus retired,
Hill, grove, or lawn, my plaint resound;
A secret pleasure soothes my pain,
And with heroic ardour fired
I cherish each illustrious wound
In memory of that bright campaign. *Dr. T. Percy.*

And for his tongue, the *camp* is full of licence,
And the sharp stinging of a lively rogue
Is to my mind far preferable to
The gross, dull, heavy, gloomy, execrations
Of a mere famished, sullen, grumbling slave.
Byron Deformed Transformed.

CAMP is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade. In these every nation forms a kind of town, where they carry on their trade, not only keeping all their warehouses and shops, but also living in these camps with their whole families. The Europeans, however, may live either in the cities or suburbs, as they please.

CAMPS, in respect to their location, ought to be planted near water, in a country of forage, where the soldiers may find wood for dressing their victuals; have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, be situated on a rising ground, in a dry gravelly soil. The advantages of the ground ought also to be considered, as marshes, woods, rivers, and enclosures; and if the camp be near the enemy, with no river or marsh to cover it, it ought to be intrenched. An army generally encamps fronting the enemy: in two lines, running parallel, about 500 yards distance; the horse and dragoons on the wings, and the foot in the centre: sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the reserve. The artillery and bread waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed eighty or 100 paces for its camp; and thirty or forty for an interval, betwixt one battalion and another. A squadron of horse is allowed thirty for its camp, thirty for an interval, and more if the ground will allow it. Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers: because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off noxious exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees: for then the air is not only moist and hurtful, but, by stagnating, becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by putrid effluvia of various kinds, which make it necessary to leave the ground with all the filth of the camp behind. This should be frequently done, if consistent with the military operations. It may also be a proper caution to order the privy-pits to be made at a distance, either in the front or the rear, as the then stationary winds may best carry off the effluvia from the camp. It will also be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious steams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw. Several modern medical writers have considered the diseases of camps, among whom Drs. Pringle and Monro may be mentioned as most celebrated.

CAMPS, ANCIENT FORMS OF. The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an enclosure of the height of ten hand-breadths. It made a square of twelve miles in compass about the tabernacle; and within this was the Levites' camp. The Greeks had also their camps, fortified with gates and ditches. The Lacedæmonians made their camp of a round figure, looking upon that as the most perfect and defensive of any form; though they doubtless dispensed with it when circumstances required. In the other Grecian camps, the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus Homer tells us that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the other princes. The figure of the Roman camp was a square divided into two principal parts: in the upper parts were the general's pavilion, or prætorium, and the tent of the chief officers; in the lower, those of inferior degree. On one side of the prætorium stood the quæstorium, or apartment of the treasurer; and near this the forum, both for a market-place and the assembling of councils. On the other side of the prætorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside from the tribunes were the præfecti of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati; then those of the extraordinarii and ablecti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called principia, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse; next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly the foreign foot. They fortified their camp with a ditch and parapet, which they termed fossa and vallum; in the latter some distinguish two parts, viz. the agger or earth, and the sudes or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same matter.

In the front of a Turkish camp are quartered the janissaries and other foot, whose tents encompass their aga: in the rear are the quarters of the spahis and other horsemen. The body of the camp is possessed by the stately tents or pavilions of the vizier, reis effendi, kahija, the tefterdar bashaw, and kapislar kahiasee. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent lailac, the place where the courts of justice are held; it being the disposition of this, that regulates all the rest. The Arabs still live in camps, as the ancient Scenites did. The camp of the Assyne Emir, or king of the country about Tadmor, is described by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that, though he had the advantage of a rising ground, he could not see the utmost extent of it. The king's tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

The CAMPAGNA DI ROMA, or Territory of Rome, is bounded on the north by Il Patrimonio di St. Pietro and Sabina, on the north-east and east by the kingdom of Naples, and on the south

AMPAGNA di Roma, or Territory of
bounded on the north by Il Patrimonio
tro and Sabina, on the north-east and
e kingdom of Naples, and on the south

and west by the Tuscan Sea. It is the most important of the States of the Church, having Rome for its capital, and comprehending the greater part of ancient Latium. It is from fifty to seventy miles long, and from forty to sixty broad. Its formation is entirely volcanic. Here are now many waste and unhealthy tracts, thinly peopled. The ruins of temples and tombs are the only conspicuous objects. The Pontine marshes cover a large district in the south-east, and fill the atmosphere with the most noxious vapors. But a good road has lately been cut through them. The soil is generally fertile, and wants only an intelligent and healthy population to render it productive. The towns of note, besides Rome, are Velletri, Frascati, Palestrina, Terracina, Tivoli, Ardea, Veroli, Albano, Nettuno, Ostia, Castel-Gandolfo, and Marino. The chief river is the Tiber, which separates this province from St. Peter's Patrimony.

CAMPAN, a town of France, in the department of the Upper Pyrenees, on the left bank of the Adour. Population 4200. This is one of the most romantic parts of France; the hills abound in red, white, and gray marble. The inhabitants rear cattle, and travel for employment into Spain. Two miles and a half south of Bagneres.

CAMPANELLA (Thomas), a celebrated Italian philosopher, born at Stilo, in Calabria, in 1568. He distinguished himself very early, for at the age of thirteen he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. At the age of twenty-two he formed a new system of philosophy, which raised him many enemies among the partizans of Aristotle. This induced him to go to Rome, whence he proceeded to Florence and Padua. In 1598 he returned to Calabria, where he was seized and carried to Naples, put seven times to the rack, and finally imprisoned for twenty-four years. During his confinement, he wrote his famous work, entitled Atheismus Triumphatus. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and cardinal Richelieu; the latter procured him a pension of 2000 livres. Campanella passed the remainder of his days in a monastery at Paris, and died in 1639.

CAMPANIA. See Campagna di Roma.

CAMPAN'IFORM, *adj.* Lat. *campana*, a bell, and *forma*. A term used of flowers, which are in the shape of a bell.

CAMPANILE, a bell tower, a detached tower in some parts of Italy, erected for the purpose of containing bells. The narrowness of the base, combined with the great elevation of these towers, has occasioned several of them to settle, as it is called, and to deviate considerably from their original perpendicular.

The campanile of Pisa, called Torre Pendente, or the hanging tower, is the most remarkable of these. Its form is that of a cylinder surrounded with eight stories of columns placed over each other; the last story, which forms the belfry, retiring a little from the general line of elevation. All the columns are of marble: from each column springs two arches, and between the columns and the circular wall of the tower is an open gallery. The height to the platform is 150 feet, and the building inclines nearly thirteen feet from the perpendicular.

CAMPANULA, the bell-flower, a genus of the monogynia order, in the pentandria class of plants; natural order, twenty-ninth, campanaceæ: cor. campanulated, with its fundus closed up by the valves that support the stamina: stig. trifid: cap. inferior, or below the receptacle of the flower, opening and emitting the seeds by lateral pores. Of this genus there are no fewer than eighty-five species, but the following are the most worthy of attention:—

1. C. Canariensis, with an orach leaf and tuberous root, is a native of the Canary Islands. The flowers are produced from the joints of the stalk, which are the perfect bell shape, and hang downward, they are of a flame color, marked with stripes of a brownish red; the flower is divided into five parts; at the bottom of each is seated a nectarium, covered with a white transparent skin, much resembling those of the crown imperial, but smaller. The flowers begin to open in the beginning of October, and there is often a succession of them till March. The stalks decay to the root in June, and new ones spring up in August.

2. C. decurrens, the peach-leaved bell-flower, is a native of the northern parts of Europe; of this there are some with white, and some with blue flowers, and some with double flowers of both colors. These last have of late been propagated in such abundance as to have almost banished from the gardens those with single flowers.

3. C. hybrida, or common Venus's looking-glass, seldom rises more than six inches, with a stalk branching from the bottom upwards. This was formerly cultivated in the gardens; but since the speculum has been introduced, whose flowers are very similar, it has almost supplanted this; for the other is a much taller plant, and the flowers larger.

4. C. latifolia, or great bell-flower. The flowers come out singly upon short foot-stalks; their colors are blue, purple and white.

5. C. medium, the Canterbury bell-flower, is a biennial plant, perishing soon after it has ripened its seeds. It grows naturally in the woods of Italy and Austria; but is cultivated in the British gardens for the beauty of its flowers, which are blue, purple, white, and striped, with double flowers of all the colors. From the setting on of the leaves proceed the foot-stalks of the flowers; those which are on the lower part of the stalk and branches diminishing gradually in their length upward, and thereby forming a sort of pyramid. The flowers of this kind are very large, and make a fine appearance. The seeds ripen in September, and the plants decay soon after.

6. C. ranunculus, the rampion, the roundish fleshy roots of which are eatable, and much cultivated in France for sallads; it was formerly cultivated in the English gardens for the same purpose, but is now generally neglected. It is a native of Britain; but the roots of the wild sort never grow to half the size of those which are cultivated.

7. C. speculum with yellow eye-bright leaves. From the wings of the leaves come out the flowers sitting close to the stalks, which are of a beautiful purple, inclining to a violet color. In the evening, they contract and fold into a pentagonal figure; from whence it is by some called viola pentagonia, or five-cornered violet.

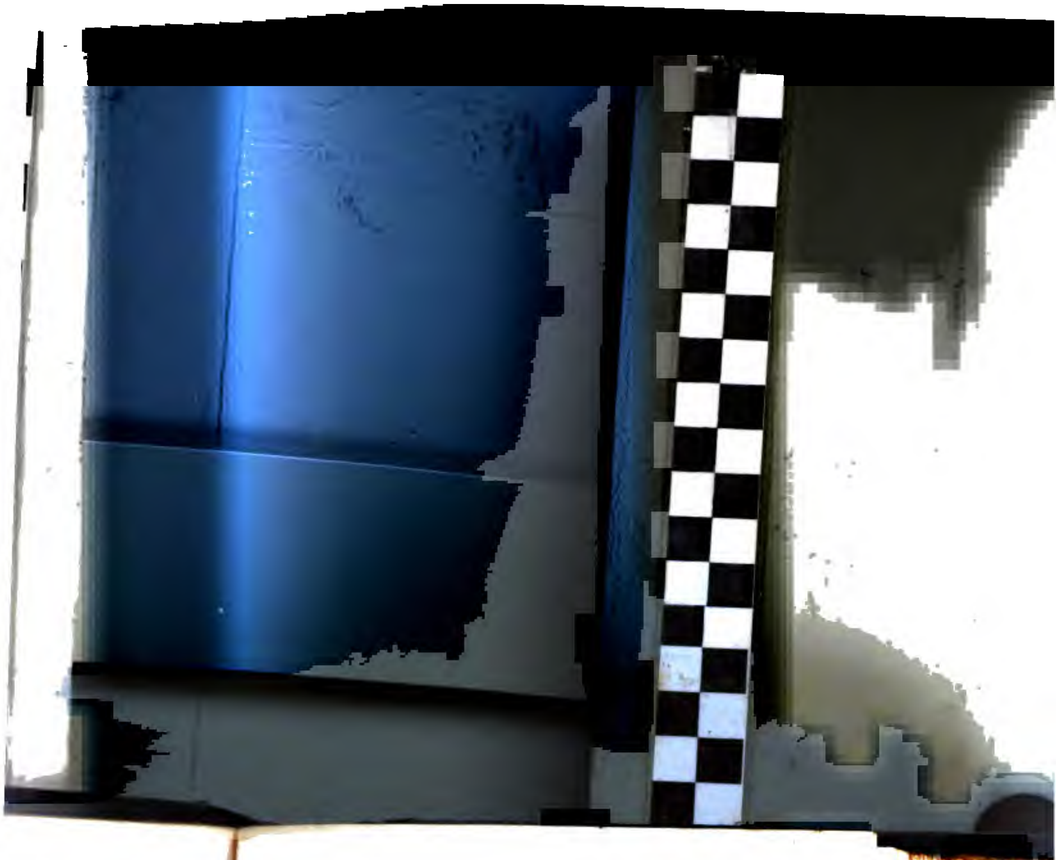
8. C. trachelium, with nettle leaves, and a perennial root. Towards the upper part of the stalks, the flowers come out alternately upon short trifid foot-stalks having hairy empalements. The colors of the flowers are a deep and pale blue and white, with double flowers of the same; only the double flowered kind merits a place in gardens.

The first species is propagated by parting the roots, which must be done with caution: for if they are broken or wounded, the milky juice will flow plentifully; and if planted before the wounds are skinned over, they rot: when any of them are broken, they should be laid in the green-house a few days to heal. They must not be too often parted, if they are expected to flower well; for they are thus weakened. The best time for transplanting and parting them is in July, soon after the stalks are decayed. They succeed best in light sandy loam, mixed with a fourth part of screened lime-rubbish: when the roots are first planted, the pots should be placed in the shade, and unless the season is very dry they should not be watered. About mid-August the roots will begin to put out fibres; at which time, if the pots are placed under a hot-bed frame, opened every day to enjoy the free air, it will greatly forward them for flowering, and increase their strength. The plants thus managed, by the middle of September will have grown so tall as not to be kept any longer under the glass frame; they must, therefore, be removed into a dry airy glass case, where they may enjoy the air in free mild weather, but screened from the cold. The second, fourth, fifth, and eighth species are so easily propagated by parting the roots, or by seeds, that no particular directions for the culture need be given. The third and seventh species are easily propagated by seeds, which they produce in plenty. If the seeds are sown in autumn, the plants will flower early in the spring; but, if sown in spring, they will not flower till mid-June; and, if a third sowing is performed about the middle of May, the plants will flower in August; but good seeds must not be expected from these. The ranunculus, which is cultivated for its esculent roots, may be propagated by seeds, which are to be sown in a shady border, and the ground to be well hoed. The roots ought to be taken up, in winter, as they are wanted. They will continue good till April, at which time they send out their stalks, when the roots become hard.

CAMPASPE, a most beautiful concubine of Alexander the Great, who ordered Apelles to draw her picture naked. But the painter, during the operation, falling in love with her, the conqueror of the world conquered his own passion so far, as to give her up to him.

CAMPBELL (George), D. D. the son of the Rev. C. Campbell, was born in 1719 at Aberdeen, where he was educated. He was at first articled to a writer of the signet, but turned his attention to divinity, and obtained in 1748 the church of Banchory Ternan. In 1756 he became one of the ministers of Aberdeen; and in 1759 was chosen principal of Marischal College. He now began his celebrated Essay on Miracles, in answer to Hume, and on the publication of it received his diploma from King's College, Aberdeen. In 1771 he was elected divinity professor. This professorship he resigned some years before his death, and the king settled on him a pension of £300 a year. He died in 1796. His other principal works are: The Philosophy of Rhetoric, in 2 vols. 8vo. 1776; A Sermon, on Allegiance, preached on the king's fast day, 1777, 4to.; An Address to the People of Scotland, on the Alarms raised by what is called the Popish Bill, 8vo. 1780; A Translation of the Gospels, with Preliminary Dissertations, 2 vols. 8vo., 1793. This was his last and greatest work; the fruit of copious erudition and unwearied application, for about thirty years; and will lead the attentive reader to regret that the other books of the New Testament had not been elucidated by the same judicious author.

CAMPBELL (John), second duke of Argyle and Greenwich, was born October 10th, 1680. At the age of fifteen he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to king William, who in 1694 gave him the command of a regiment. In this situation he remained till the death of his father in 1703; when, becoming duke of Argyle, he was sworn of queen Anne's privy council, made captain of the Scotch horse guards, and appointed one of the extraordinary lords of session. In 1704 the queen, reviving the Scottish order of the thistle, installed the duke one of the knights, and soon after appointed him high commissioner to the Scotch parliament; where, being of great service in promoting the Union, he was on his return created a peer of England, and in 1710 knight of the garter. He first distinguished himself at the battle of Oudenard; where he commanded as brigadier-general. He was also present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had a share likewise in the victory of Malplaquet, by dislodging the French from the wood of Sart, and gaining a post of great consequence. Soon after, he was sent to take the command in Spain; and, after the reduction of Port Mahon, returned to England. Having now a seat in the house of lords, he censured the measures of the ministry with such freedom, that he was deprived of all his places: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715 he was made commander-in-chief in North Britain. In direct opposition to that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, a nobleman of the same family and kindred. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived in London March 6th, 1716, and was in high favor; but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and



to divinity, and obtained in 1748 the
Banchory Ternan. In 1756 he became
: ministers of Aberdeen; and in 1759
n principal of Marischal College. He

---

from this period to 1718 signalised himself in a civil capacity. In the beginning of 1719 he was again admitted into favor, appointed lord steward of the household, and, in April following, created duke of Greenwich. He continued in the administration during the remaining part of that reign; and, after the accession of king George II, till April 1740; when he delivered a speech with which the ministry being highly offended, he was again dismissed. He was soon however restored; but not approving of the measures of the new ministry, gave up all his posts for the last time, and died in privacy, of a paralytic disorder, on the 4th of October, 1743. A noble monument, by Roubilliac, was erected in Westminster Abbey to his memory. The titles of duke and earl of Greenwich, and baron of Chatham, became extinct at his death; but in his other titles he was succeeded by his younger brother Archibald, earl of Ilay.

Campbell (John), an historical, biographical, and political writer, was born at Edinburgh, March 8th, 1708; and was the fourth son of Robert Campbell of Glenlyon, by a Miss Smith of Windsor in Berkshire, a descendant of the poet Waller. At five years of age he was brought from Scotland to Windsor, where he received his education; and was placed as clerk to an attorney. This profession, however, he never followed; but, by a close application to science, qualified himself to appear with great advantage in the literary world. In 1736 he gave to the public, in 2 vols. folio, The Military History of Prince Eugene and the Duke of Marlborough, enriched with maps, plans, and cuts. The reputation he acquired occasioned him soon after to be solicited to take a part in the Ancient Universal History. Whilst employed in this work, Mr. Campbell found leisure to undertake several other pieces. In 1739 he published the Travels and Adventures of Edward Brown, Esq., 8vo.; and Memoirs of the Bashaw Duke de Ripperda, 8vo.; reprinted, with improvements, in 1740. These were followed, in 1741, by the Concise History of Spanish America, 8vo. In 1742 he published A Letter to a Friend in the Country, on the Publication of Thurloe's State Papers; and the first and second vols. of his Lives of the English Admirals, and other eminent British Seamen. The two remaining vols. were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr. Campbell's works to which he prefixed his name. In 1743 he published Hermippus Redivivus; a second edition of which, much improved and enlarged, came out in 1749. In 1744 he gave to the public, in 2 vols. folio, his Voyages and Travels, on Dr. Harris's plan. The time and care employed by Mr. Campbell in this important undertaking, did not prevent his engaging in another great work, the Biographia Britannica, which began to be published in weekly numbers in 1745, and extended to 7 vols. folio; but his articles were only in the first 4 vols. When the late Mr. Dodsley formed the design of the Preceptor, which appeared in 1748, Mr. Campbell was engaged to assist in it. The parts written by him were the Introduction to Chronology, and the Discourse on Trade and Commerce. In 1750 he published the first separate edition of his Present State of Europe; a work which had been originally begun in 1746 in the Museum, a valuable periodical work printed for Dodsley. The next great undertaking which called for the exertion of his abilities and learning, was The Modern Universal History. This extensive work was published, in detached parts, till it amounted to 16 vols. folio; and a second edition of it, in 8vo., began to appear in 1759. The parts written by Mr. Campbell were, the histories of the Portuguese, Dutch, Spanish, French, Swedish, Danish, and Ostend Settlements in the East Indies; and the Histories of the kingdoms of Spain, Portugal, Algarve, and Navarre; and of France, from Clovis to 1656. The degree of LL. D. was conferred upon him June 18th, 1754, by the university of Glasgow. His favorite work was, A Political Survey of Great Britain, 2 vols. 4to., published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. He was, during the latter part of his life, agent for the province of Georgia in North America; and died in 1775, aged sixty-seven.

Campbell, a county of Virginia, bounded on the north by the Fluvanna, which divides it from Amherst; east by Charlotte and Prince Edward counties; north-east by Buckingham; west by Franklin and Bedford counties; and south by Pittsylvania. It is forty-five miles in length, and thirty in breadth.

CAMPBELTOWN, a royal burgh and post town in the parish of the same name, in the county of Argyle, seated on the lake of Kilkerran, on the eastern shore of the district of Kintyre, of which it is the chief town. It has a good harbour; and is now a very considerable place, though within these sixty years only a petty fishing town. It has in fact been created by the fishery; having been apppointed the place of rendezvous for the busses; and above 300 have been seen in the harbour at once. Its vicinity to the markets of Ireland and the Clyde, are advantages which very few sea-ports enjoy. The harbour is about two miles long and one broad, in the form of a crescent, with from six to ten fathoms water, and excellent anchorage, surrounded by high hills on each side, and an island to shelter the entrance. Two public libraries are also established, and a good school. This town was erected into a royal burgh in 1701, and is governed by a provost, two bailies, a dean of guild, treasurer, and twelve counsellors. It joins with Ayr, Irvine, Inverary, and Rothsay, in sending a member to parliament. It lies thirty miles west of Ayr, and 176 miles west by south from Edinburgh.

CAMPDEN, a market town of Gloucestershire, famous for its stocking manufactures. The church is a fine gothic building, said to be as old as William II. Here is also a grammar school and two charity schools. In the neighbourhood is a silk mill and manufactory. Market on Wednesday. Seven miles east from Evesham, and ninety W.N.W. from London.

CAMPEACHY, a town of Mexico, seated on the east coast of the bay of this name, and defended by a good wall and strong forts: but it is not so rich as formerly; having been once the principal port for the sale of logwood. It was taken by the English in 1596; by the buccaneers in 1650 and 1678; and by the Flibusters of St. Domingo in 1685, who set it on fire and blew up the citadel. It was once a considerable native town, and the Spaniards afterwards found many curious Indian antiquities here. The port is large, but the water shallow. The houses are of stone, and generally well built. Population about 6000. Its principal trade is in wax and cotton cloth, which is manufactured here.

CAMPEACHY WOOD, in botany. See HÆMATOXYLUM.

CAMPEN, a fortified town of the Netherlands, has a citadel and harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672; they abandoned it in 1673. It is seated near the mouth of the river Yssel, on the Zuider Zee. The most remarkable edifices are the two churches, the town-house, and the wooden bridge across the Yssel, which is 720 feet long, and 20 broad. The country around can readily be laid under water. Population 6200. Thirteen miles north of Arnheim, and forty-five north-east of Amsterdam.

CAMPES'TRAL, *adj.* Latin, *campestris*; growing in fields.

> The mountain beech is the whitest; but the *campestral*, or wild beech, is blacker and more durable.
> *Mortimer.*

CAMPESTRE, in antiquity, a cover for the body, worn by the Roman soldiers in their field exercises; being girt under the navel, and hanging down to the knees. The name is formed from campus, the field, where they performed these exercises.

CAMP FIGHT, among old law writers, is spelt KAMP FIGHT. We therefore refer the reader, for an account of this obsolete mode of legal duelling to that article.

CAM'PHIRE, *v.* & *n.*
CAM'PHIRE-TREE,
CAM'PHORATE, *n.*
CAM'PHORATED.

Καφυρα; Ar. Heb. Per. *kafoor*; Sans. *kupoor*; Fr. *camphre*; Lat. *camphora* A white resinous gum.

> There are two sorts of this tree; one is a native of the isle of Borneo, from which the best *camphire* is taken, which is supposed to be a natural exudation from the tree, produced in such places where the bark of the tree has been wounded or cut. The other sort is a native of Japan, which Dr. Kempfer describes to be a kind of bay, bearing black or purple berries, from whence the inhabitants prepare their *camphire*, by making a simple decoction of the root and wood of this tree, cut into small pieces; but this sort of *camphire* is in value eighty or an hundred times less than the true Bornean *camphire*. *Miller.*
>
> Spirit of wine *camphorated*, is a remedy frequently applied externally in cases of inflammations, &c.
> *Dr. A. Rees.*

CAMPHIRE, CAMPHOR, or CAMPHORA, a solid concrete juice extracted from the wood of the laurus camphora. See LAURUS CAMPHORA.

CAMPHOROSMA, in botany, stinking ground pine, a genus of the tetrandria order and monogynia class of plants: natural order twelfth, holoraceæ: CAL. is pitcher-shaped and indented, there is no corolla; and the capsule contains a single seed. It is reputed cephalic and nervine; though little used in modern practice. It takes the name from its smell, which bears some resemblance to that of camphor. There are five species. Of these the principal is, C. Monspeliensis, which grows especially about Montpelier It has been produced as a specific for the dropsy and asthma.

CAMPHUYSEN (Dirk Theodore Raphael), an eminent painter, born at Gorcum in 1586. He learned the art from Govertze, but soon far surpassed his master. His subjects were landscapes, mostly small, with ruinous buildings, huts of peasants, or views of villages on the banks of rivers. He generally represented them by moon light. His pencil is remarkably soft; his coloring very transparent, and his expertness in perspective is seen in the proportional distances of his objects. Few of his works are to be met with, and they bring considerable prices.

CAMPIAN (Edmund), an English Jesuit, born in London, of indigent parents, in 1540; and educated at Christ's Hospital, where he had the honor to deliver an oration before queen Mary on her accession to the throne. He was admitted a scholar of St. John's College in Oxford on its foundation, and took the degree of M. A. in 1564. About the same time he was ordained, and became an eloquent Protestant preacher. In 1566, when queen Elizabeth was entertained by the University of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St. Mary's church. In 1568 he was junior proctor of the University. In 1569 he went over to Ireland, where he wrote a history of that kingdom, and became papist, and being assiduous in persuading others to follow his example, was committed to prison. He soon, however, made his escape, and in 1571 proceeded to Douay in Flanders, where he publicly recanted his former opinions, and was created B. D. He went soon after to Rome, where, in 1573, he was admitted of the Society of Jesus, and was sent by the general to Vienna, where he wrote his tragedy, called Nectar et Ambrosia, which was acted before the emperor with great applause. He went next to Prague, where he resided in the Jesuits' college about six years, and then returned to Rome. From thence, in 1580, he was sent by pope Gregory XIII. with father Parsons, to convert the people of England. They were joyfully received by their friends; but had not been long in England before Campian was apprehended, and conducted in triumph to London. He was imprisoned in the tower; where, says Wood, 'he did undergo many examinations, abuses, wrackings, tortures.' He was finally condemned on the statute 25 Edward III. for high treason; and butchered at Tyburn, with two or three of his fraternity. 'All writers, whether Protestant or Popish, say, that he was a man of admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher, whether in English or Latin, of a sweet disposition, and a well polished man.' His History of Ireland, in two books, was published by Sir James Ware, their riches, and several colonies were planted by them over the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St. Athanasius's time, the African, still said they were descended from the Canaanites; and the Punic tongue was almost entirely the same with the Canaanitish and Hebrew languages. The colonies which Cadmus carried into Thebes in Bœotia, and his brother Cilix into Cilicia, came from the stock of Canaan. The isles of Sicily, Sardinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by them. Bochart, in his large work, entitled Canaan, has set this matter in a clear light. Many of the old inhabitants of the north-west of Canaan, however, particularly on the coast of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan long after those other parts of the country, which were better inhabited by the Israelites, had lost the name. The Greeks called this tract, inhabited by the old Canaanites, Phœnicia; the more inland parts, being inhabited partly by Canaanites, and partly by Syrians, Syrophœnicia: and hence the woman, said by St. Matthew (xv. 22.) to be a woman of Canaan, whose daughter Jesus cured, is said by St. Mark (vii. 26.) to be a Syrophœnician by nation, as she was a Greek by religion and language.

CANADA. See America, British, vol. ii. p. 46—49, where is a full account of this interesting colony.

CANAILLE', *n. s.* French. The lowest people; the dregs; the lees; the offscouring of the people: a French term of reproach.

CANAL', Lat. *canalis.* Virgil uses *canalis* for a trough. It literally means the hollow of any thing, like the hollow of a cane. Thus narrow pieces of water in a garden, which are drawn out to any considerable length, are called canals. And the term is now appropriated to any tract or course of water made by art. It is used in its primitive sense, in anatomy, to designate any conduit or passage through which the juices of the body flow.

> But soche a fairenesse of a necke
> Yhad that swete, that bone nor brecke,
> N'as there none seen that missesatte,
> It was white, smothe, streight, and pure flatte,
> Withouten hole or *canel* bone,
> And by seming she had none.
>
> *Chaucer's Boke of the Duchesse.*
>
> The walks and long *canals* reply. *Pope.*
>
> So with strong arm immortal Brindley leads
> His long *canals*, and parts the velvet meads;
> Winding in lucid lines, the watery mass
> Mines the firm rock, or loads the deep morass. *Dar*
>
> The rushing flood from sloping pavements pours,
> And blackens the *canals* with dirty showers. *Gay.*

Canals. See Inland Navigation.

Canal'-coal, *n. s.* A fine kind of coal, dug up in England.

> Even our *canal-coal* nearly equals the foreign jet.
>
> *Woodward.*

CANALES Semicirculares, three semicircular canals placed in the posterior part of the labyrinth of the ear. They open by five orifices into the vestibulum. See Ear and Physiology.

CANALIC'ULATED, *adj.* from Lat. *canaliculatus;* channelled; made like a pipe or gutter.

CANALIS Arteriosus, canaliculus arteriosus; canalis botalii. A blood-vessel peculiar to the fœtus, disappearing after birth; through which the blood passes from the pulmonary artery into the aorta.

Canalis Nasalis, a canal going from the internal canthus of the eye downwards into the nose: it is situated in the superior maxillary bone, and is lined with the pituitary membrane continued from the nose.

Canalis Petitianus, a triangular cavity, naturally containing a moisture, between the two laminæ of the hyaloid membrane of the eye, in the anterior part, formed by the separation of the anterior lamina from the posterior. It is named after its discoverer, M. Petit.

Canalis Venosus, a canal peculiar to the fœtus, disappearing after birth, that conveys the maternal blood from the porta of the liver to the ascending vena cava.

CANANDAQUA, a post town, the capital of Ontario county, seated near the lake, thirty miles from Jerusalem, and 434 N. N. W. of Philadelphia. Courts of sessions and common pleas are held in it, first Tuesday of June and November.

CANANORE, a town and district on the coast of Malabar, once a separate kingdom. The natives are generally Mahommedans; and the country produces pepper, cardamoms, ginger, mirobolans, and tamarinds, in which they drive a considerable trade. The town has a safe harbour. It formerly belonged to the Portuguese, and had a strong fort to guard it; but in 1683 the Dutch, together with the natives, drove them out, and enlarged the fortifications. It was afterwards taken by Tippoo Saib, and finally by the English in 1790. It is under a native sovereign, tributary to the East India Company. Distant fifteen miles north-east of Tellicherry, and 100 W. S. W. of Seringapatam.

CANARA, or Canata, a province of Hindostan, on the coast of Malabar. Here is a pagoda, called Ramtrut, which is visited every year by a great number of pilgrims, and the custom of burning the wives with their husbands is much practised. The lower grounds yield every year two crops of corn or rice; and the higher produce pepper, betel-nuts, sanders wood, iron and steel. The whole province is about 180 miles in length, and from thirty to seventy broad: the climate fine, and the teak wood abundant. The principal towns are Barcelore, Batecola, Carwar, Mangalore, and Onore. It was ceded by Tippoo Saib to the English in 1799.

CANARIA, in ancient geography, one of the Fortunate Islands, a proof that these are what we now call the Canaries. Canaria had its name from abounding with dogs of an enormous size.

Canaria, or the Grand Canary, an island in the Atlantic Ocean, about 180 miles from the coast of Africa. It is forty-two miles long, twenty-seven broad, about 100 in circumference, and thirty-three in diameter. It is fruitful, and famous for its wine. It also abounds with apples, melons, oranges, citrons, pomegranates, figs, olives, peaches, and plantations. The fir and palm-trees are the most common. The towns are, Canary the capital, Gualdera, and Geria.

CANARINA, in botany, a genus of plants of the class hexandria, and order monogynia: CAL. six-leaved; COR. six-cleft, and campanulate; STIG. SIX: CAPS. inferior, six-celled, many-seeded. Species one only, a native of the Canaries.

CANARIUM, in antiquity, from canis, a dog, a Roman sacrifice, wherein dogs of a red color were sacrificed, for a security of the fruits of the earth against the raging heats of Sirius in the dog-days.

CANARIUM, in botany, a genus of the diœcia order, in the pentandria class of plants. Its characters are, that it has male and female flowers; that in both the calyx has three leaves, and the corolla consists of three petals; the fruit is a drupa with a three-cornered nut. There is but one species, an East Indian tree.

CANA'RY, a kind of linnet, a dance, and a peculiar wine, are imported from the Canary Isles, and thence deriving their name.

I will to my honest knight Falstaff, and drink *canary* with him.—I think I shall drink pipe, wine first with him; I'll make him dance. *Shakspeare.*

Master, will you win your love with a French brawl?—How mean'st thou, brawling in French?—No, my complete master; but to jig off a tune at the tongue's end, *canary* to it with your feet, humour it with turning up your eyelids. *Id.*

Of singing birds, they have linnets, goldfinches, ruddocks, *canary-birds*, blackbirds, thrushes, and divers others. *Carew.*

CANARY, or CIVITAD DE PALMAS, the capital of the island of Canaria. It has an indifferent castle, a court of inquisition, and the supreme council of the rest of the Canary Islands. It is a bishop's see, and has four convents, two for men and two for women. It is about three miles in compass, and contains 12,000 inhabitants. The houses are only one story high, and flat at the top; but they are well built. The cathedral is a handsome structure.

CANARY BIRDS, in ornithology. See FRINGILLA.

CANARY GRASS. See PHALARIS.

CANARY ISLANDS, or CANARIES, are situated in the Atlantic Ocean, over against Morocco. They were formerly called the Fortunate Islands, on account of the temperate healthy air, and excellent fruits. The land is very fruitful both in wheat and barley. The cattle thrive well, and the woods are full of all sorts of game. The birds are well known throughout Europe. Sugar canes abound greatly, but the Spaniards first planted vines here, whence we have the wine called Canary. These islands were not unknown to the ancients; but they were forgotten till John de Betencourt discovered them, in 1402. It is said they were first inhabited by the Phœnicians, or Carthaginians, but the inhabitants could not tell from whence they were derived; on the contrary they did not know there was any other country in the world. Their language, manners, and customs, had no resemblance to those of their neighbours. They had no iron. The Spaniards obtained possession of them all, except Madeira, which belongs to the Portuguese; and they still retain them. The settlers are chiefly Spaniards, though there are some of the original natives remaining, whom they call Guanches. These are somewhat civilised by their intercourse with the Spaniards; and are a hardy, active, bold people. They live on the mountains, and their chief food is goats' milk. Their complexion is tawny and their noses flat. The Spanish vessels, when they sailed for the West Indies, always called at these islands, going and coming. Their names are ALLEGRANZA, CANARIA, FERRO, FUERTAVENTURA, GOMERA, GRACIOSA, INFERNO, LANCEROTTA, LOBOS, MADEIRA, PALMA, ROCCA, ST. CLARE, SALVAGES, and TENERIFFE. See those articles. Long. from 12° to 31° W. Lat. from 27° 30' to 29° 30' N.

CANCALLE, a sea-port town of France, in the department of the Morbihan, and ci-devant province of Upper Britanny. Here the British landed in 1758, in their way to St. Malo, where they burned a great number of ships in the harbour, and then retired without loss. It is eight miles from St. Malo.

CANCAMUM, among ancient Greek physicians, a gum resin, supposed to be gum lac.

CANCEL, *v.* & *n.*
CAN'CELLATED, *adj.*
CANCELLA'TION.

From Lat. *cancelli*; lattices; the mode of obliteration, by lines crossing each other. Hence to cross out, is to cancel by wiping out or expunging the contents of an instrument by two lines drawn in the manner of a cross. Blackstone uses the word in its technical and proper sense. To blot out; to supersede; to destroy; in reference to any thing written. To cancel a debt is, to cross the bill.

Now welcome night, thou night so long expected,
That long day's labour doth at last defray,
And all my cares which cruel love collected
Has summed in one, and *cancelled* for aye. *Spenser.*

Know then, I here forget all former griefs,
Cancel all grudge; repeal thee home again.
Shakspeare.

———————— but those elect
Angels, contented with their fame in heaven,
Seek not the praise of men: the other sort,
In might though wondrous, and in acts of war,
Nor of renown less eager, yet by doom
Cancelled from heaven and sacred memory,
Nameless in dark oblivion let them dwell. *Milton.*

Such a plot was layed,
Had not Ashley betrayed,
As had *cancelled* all former disasters,
And your wives had been strumpets
To his highness's trumpets,
And foot-boys had all been your masters.
Marvell.

My warm assistance gave thee birth,
Or thou hadst perished low in earth;
But upstarts, to support their station,
Cancel at once all obligation. *Gay.*

The tail of the castor is almost bald, though the beast is very hairy; and *cancellated*, with some resemblance to the scales of fishes. *Grew.*

Thou, whom avenging powers obey,
Cancel my debt, too great to pay,
Before the sad accounting day. *Roscommon.*

I pass the bills, my lords,
For *cancelling* your debts. *Southerne.*

In the proper sense of the word, *to cancel* is to deface an obligation, by passing the pen from top to

bottom, or across it; which makes a kind of chequer lattice, called by the Latins *cancelli*. *Dr. A. Rees.*

CAN'CELEER, *s.* or } From Fr. *chancel-*
CAN'CELIER. } *lor;* the turn of a light-flown hawk upon the wing to recover her self, when she misses her aim in the stoop. Dr Rees (Cyclopedia) says, 'It is when a light-flown hawk, in her stooping, turns two or three times upon the wing, to recover herself before she seizes.'

> Nor with the falcon fetch a *cancelleer.*
> *T. Weever's Epigram.*

Also as a verb, to cancelier, to turn in flight.

> ——— the partridge sprung,
> He makes his stoop; but wanting breath, is forced
> To *cancelier*; then with such speed as if
> He carried lightning in his wings, he strikes
> The trembling bird. *Mass. Guard.*

CANCELLATA, in conchology, a species of arca, inhabiting the American Ocean, the shell of which is marked with the cancellated striæ, and bearded; the margin gaping in the middle.

CANCELLI, in building, lattice windows, or those made of cross bars disposed latticewise. It is also used for rails or balusters enclosing the communion table, a court of justice, or the like; and for the net-work in the inside of hollow bones.

CANCELLING, in the civil law, an act whereby a person consents that some former deed be rendered null and void; otherwise called recision.

CAN'CER, *n.* } Sax. *cancere;* Fr. *cancre;*
CAN'CERATE, *v.* } Ital. *cancro;* Span. *cancer;*
CAN'CEROUS. } Dutch, *kancker.* A virulent swelling, which generally suppurates, producing a hard, uneven, obstinate sore, which spreads and deepens by fibres which appear like the legs and claws of a crab; while its general appearance resembles the creature after which it is named.

> But striking his fist upon the point of a nail in the wall, his hand *cancerated*, he fell into a fever, and soon after died on't. *L'Estrange.*
>
> How they are to be treated when they are strumous, schirrus, or *cancerous*, you may see in their proper places. *Wiseman.*
>
> Any of these three may degenerate into a schirrus, and that schirrus into a *cancer.* *Id.*
>
> As when a *cancer* on the body feeds,
> And gradual death from limb to limb proceeds;
> So does the chilness to each vital part
> Spread by degrees, and creeps into the heart.
> *Addison.*

CAN'CER, *n. s.* Lat. *cancer.* A crabfish; the sign of the summer solstice.

> When now no more the alternate twins are fired,
> And *Cancer* reddens with the solar blaze,
> Short is the doubtful empire of the night. *Thomson.*

CANCER, in astronomy, one of the twelve signs, represented on the globe in the form of a crab, and thus marked (♋). It is the fourth constellation in the starry zodiac. See ASTRONOMY. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us. By others, the disposition of stars in this sign is supposed to have given the first hint to the representation of a crab. It gives name to a quadrant of the ecliptic, viz.

CANCER, TROPIC OF, in astronomy, a lesser circle of the sphere, parallel to the equator, and passing through the sign Cancer. See ASTRONOMY.

CANCER, in medicine, a roundish, unequal, hard, and livid tumor, generally seated in the glandulous part of the body, supposed to be so called, because it appears at length with turgid veins, shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish. See MEDICINE. The matter of cancer was found by Dr. Crawford to give a green color to syrup of violets, and treated with sulphuric acid, to emit a gas resembling sulphuretted hydrogen, which he supposes to have existed in combination with ammonia in the ulcer. Hence the action of virulent pus on metallic salts. He likewise observed, that its odor was destroyed by aqueous chlorine, which he therefore recommends for washing cancerous sores. But although several medicines, both internal and external have been tried, and in some instances partially succeeded, the only method of cure on which reliance may be placed is that by extirpating the part affected.

CANCER, in zoology, a genus of insects of the order of aptera. The generic characters are these: they have eight legs (seldom ten or six), besides the two large claws which answer the purpose of hands. They have two eyes at a considerable distance from each other, and for the most part supported by a kind of pedunculi or foot-stalks; the eyes are likewise elongated and moveable; they have two clawed palpi, and the tail is jointed. The species have been well divided into these classes:

1. The crab, properly so called, having four filiform antennæ. See CRAB. 2. Pagarus antennæ, pedunculate, inhabiting cast-off shells. 3. Galathæa, antennæ unequal. 4. Astacus, or the lobster, with foliaceous tail. See LOBSTER. 6. Squilla, with a very short thorax. 6. Gammarus, antennæ pedunculate and simple. 7. Scyllarus, having two biarticulate plates instead of the hinder antennæ. See also SHRIMP.

CANCROMA, or boat-bill, in ornithology, a genus of birds belonging to the order of grallæ: the characters of which are,—the bill is broad, with a keel along the middle; the nostrils are small, and lodged in a furrow; the tongue is small, and the toes are divided. There are two species: 1. C. cancrophaga, or the brown boat-bill. In this species the under parts, instead of ash color, are of a pale rufous brown; the tail rufous ash; and the upper parts wholly of a cream color; the bill and legs of a yellow brown. It inhabits Cayenne, Guiana, and Brasil, and chiefly frequents such parts as are near the water: in such places it perches on the trees which hang over the streams, and like the king's-fisher, drops down on the fish which swim beneath. It has been thought to live on crabs likewise, whence the Linnæan name. 2. C. cochleari, the crested boat-bill, is of the size of a fowl; the length twenty-two inches. The bill is four inches long, and of singular form, not unlike a boat with the keel uppermost; the upper mandible has a prominent ridge at the top, and on each side of this a channel, at the bottom of which the nostrils are placed; these are oval, and situated obliquely; the general color of the bill is dusky; from the hind head springs a long black crest, the feathers which compose it narrow, and end in a point.

CANDAHAR. See Kandahar.

CANDELA Fumalis, the smoking candle, is an odoriferous mass, shaped like a candle, the use of which is to fumigate rooms where there is any contagion or noxious smell. The candela fumalis, or candela pro suffitu odorata, as it is also called, consists of aromatic powders, mixed up with a third or more of the charcoal of willow or lime tree, and reduced to a proper consistence with a mucilage of gum tragacanth, labdanum, or turpentine. It excites a grateful smell without any flame, and corrects the state of the air.

CAN'DENT, *adj.* Lat. *candens.* Hot; in the highest degree of heat, next to fusion.

> If a wire be heated only at one end, according as that end is cooled upward or downward, it respectively acquires a verticity, as we have declared in wires totally *candent.* *Brown.*

CANDEROS, in the materia medica, an East Indian gum, not much known among us, though sometimes imported. It has much the appearance of amber, only it is white and pellucid. Garcias and others tell us that the people of Borneo have the art of adulterating the crude camphor with large quantities of this gum.

CANDIA, the ancient Crete, one of the largest islands in the Mediterranean, and situate south of the Grecian Archipelago, is about 180 miles long, and twenty-five to thirty broad. The island abounds with mountains, the most remarkable of which are the Psilorite or Ida of the ancients, and the mountains of Sphachia or the white mountains, the summits of which are covered with snow nearly half the year. The fertile valleys abound with springs of excellent water. Of the natural advantages and salubrious climate of this island, travellers speak with raptures. The heat is never excessive; and in the plains violent cold is never felt. In the warmest days of summer the atmosphere is cooled by breezes from the sea. December and January are their only winter months, and then there is a copious fall of rain; the sky is obscured with clouds, and the north winds blow violently; but in February the ground is again overspread with flowers and rising crops; and the rest of the year is almost one continued fine day. Thus the air here is always found extremely congenial to delicate constitutions, and epidemical diseases are almost unknown. Fevers prevail here in the summer, but are not generally dangerous. This fine country is, however, infested with one dreadful disorder, the leprosy, which is infectious, and said to be instantaneously communicated by contact. The victims who are attacked by it, are driven from society, and confined to little ruinous houses on the way side. They are strictly forbidden to leave these dwellings, or hold intercourse with any person. Having generally beside their huts a small garden producing pulse, they feed poultry; and with what they obtain from passengers, find means to drag out a painful life in circumstances of shocking bodily distress. The disorder appears to be chiefly confined to the poor Greeks.

The coast of Candia abounds with excellent harbours, the principal of which are Grabusa on the west, the bay of Suda on the north, and Paleo Castro on the east. The south is almost inaccessible.

But little labor is here required to produce the necessaries or the luxuries of life. But the insecurity of property, under the tyranny of the Turks, prevents all attempts at extensive cultivation. It yields, however, abundance of oil, silk, honey, wax, saffron, figs, walnuts, apricots, almonds, oranges, citrons, olives, melons, and grapes, which grow very large, and produce wine of an excellent flavor. Shrubs and flowers also abound in this salubrious spot. Its principal manufacture is soap, which, though not so good as French soap, is still preferred by the Turks for its cheapness.

Candia is at present governed by three pachas, who reside respectively at Candia, Canea, and Retimo. For the earlier history of this island see Crete. It came into the possession of the Venetians by purchase, in the year 1194, and soon began to flourish under the laws of that republic. The inhabitants, encouraged by their masters, engaged in commerce and agriculture. The Venetian commandants readily afforded to those travellers who visited the island, every assistance necessary to enable them to extend and improve useful knowledge. Belon, the naturalist, is lavish in praise of their good offices, and describes, in an interesting manner, the flourishing state of that part of the island which he visited. The seat of government was established at Candia, the magistrates and officers, who composed the council, resided there. The provisor general was president. He possessed the chief authority; and his power extended over the whole principality. It continued in the possession of the Venetians for five centuries and a half. Cornaro held the chief command when it was threatened with a storm, on the side of Constantinople. The Turks, for a whole year, had been employed in preparing a vast armament. They deceived Cornaro, by assuring him that it was intended against Malta. In 1645, in the midst of a solemn peace, they appeared unexpectedly before Crete with a fleet of 400 sail, having on board 60,000 land forces, under the command of four pachas. The emperor Ibrahim, under whom this expedition was undertaken, had no fair pretext to offer in justification of the enterprise. He made use of all that perfidy which characterises the people of the east, to impose on the Venetian senate. He loaded their ambassadors with presents; directed his fleet to bear for Cape Matapan, as if they had been going beyond the Archipelago; and caused the governors of Tina and Cerigna to be solemnly assured, that the republic had nothing to fear for her possessions. At the very instant when he was making those assurances, his naval armament entered the gulf of Canea; and, passing between that city and St. Theodore, anchored at the mouth of Platania. The Venetians

ng him that it was intended against Malta.
1645, in the midst of a solemn peace, they
eared unexpectedly before Crete with a fleet
400 sail, having on board 60,000 land forces,
ler the command of four pachas. The em-
or Ibrahim, under whom this expedition
s undertaken, had no fair pretext to offer in
ification of the enterprise. He made use of
that perfidy which characterises the people of
east, to impose on the Venetian senate. He
ded their ambassadors with presents; directed
fleet to bear for Cape Matapan, as if they
d been going beyond the Archipelago; and
used the governors of Tina and Cerigo to be
lemnly assured, that the republic had nothing
fear for her possessions. At the very instant
en he was making those assurances, his naval
mament entered the gulf of Canea; and, pas-
ng between that city and St. Theodore, anchor-
l at the mouth of Platania. The Venetians

---

not expecting this sudden attack, had made no preparations to repel it. The Turks landed without opposition. The isle of St. Theodore is but a league and a half from Canea, and is only three quarters of a league in compass. The Venetians had erected two forts there; one of which, standing on the summit of the highest eminence, on the coast of that little isle, was called Turluru; the other on a lower situation, was named St. Theodore. It was an important object to the Mussulmans to make themselves masters of that rock, which might annoy their ships. They immediately attacked it with ardor. The first of those fortresses, being destitute of soldiers and cannon, was taken without striking a blow. The garrison of the other consisted of no more than sixty men. They made a gallant defence and stood out till the last extremity; and, when the Turks at last prevailed, their number was diminished to ten, whom the captain pacha cruelly caused to be beheaded. Being now masters of that important post, as well as of Lazaret, an elevated rock, standing above half a league from Canea, the Turks invested the city by sea and land. General Cornaro was struck, as with a thunder-clap, when he learned the descent of the enemy. In the whole island there were no more than a body of 3500 infantry, and a small number of cavalry. The besieged city was defended only by 1000 regular troops, and a few citizens, who were able to bear arms. He made haste to give the republic notice of his distress; and posted himself off the road, that he might the more readily succour the besieged city. He threw a body of 250 men into the town, before the lines of the enemy were completed. He afterwards made several attempts to strengthen the besieged with other reinforcements; but in vain. The Turks had advanced in bodies close to the town, had carried a half-moon battery, which covered the gate of Retimo; and were battering the walls night and day with their numerous artillery. The besieged defended themselves with resolute valor, and the smallest advantage which the besiegers gained cost them dear. Cornaro made an attempt to arm the Greeks, particularly the Spachiots, who boasted loudly of their valor. He formed a battalion of these. But the æra of their valor was long past. When they beheld the enemy, and heard the thunder of the cannon, they took to flight; not one of them would stand fire. While the senate of Venice were deliberating on the means to be used for relieving Canea, and endeavouring to equip a fleet, the Mahommedan generals were sacrificing the lives of their soldiers to bring their enterprise to a glorious termination. In different engagements they had already lost 20,000 warriors; but, descending into the ditches, they had undermined the walls, and blown up the most impregnable forts with explosions of powder. They sprung one of those mines beneath the bastion of St. Demetri. It overturned a considerable part of the wall, which crushed all the defenders of the bastion. That instant the besiegers sprung up with their sabres in their hands, and taking advantage of the general consternation of the besieged in that quarter, made themselves masters of the post. The besieged, recovering from their terror, attacked them with unequalled intrepidity. About 400 men assailed 2000 Turks already firmly posted on the wall, and pressed upon them with such obstinate and dauntless valor, that they killed a great number, and drove the rest down into the ditch. In this extremity, every person in the city was in arms. The Greek monks took up muskets; and the women, forgetting the delicacy of their sex, appeared on the walls among the defenders, either supplying the men with ammunition and arms, or fighting themselves; and several of those daring heroines lost their lives. For fifty days the city held out against all the forces of the Turks. If even at the end of that time, the Venetians had sent a naval armament to its relief, the kingdom of Candia might have been saved. Doubtless, they were not ignorant of this well-known fact. The north wind blows straight into the harbour of Canea. When it blows a little briskly, the sea rages. It is then impossible for any squadron of ships, however numerous, to form in line of battle in the harbour, and to meet an enemy. If the Venetians had set out from Cerigo with a fair wind, they might have reached Canea in five hours, and might have entered the harbour with full sails, without being exposed to one cannon shot; while none of the Turkish ships would have dared to appear before them; or, if they had ventured, must have been driven back on the shore, and dashed in pieces among the rocks. But, instead of thus taking advantage of the natural circumstances of the place, they sent a few galleys, which, not daring to double Cape Spada, coasted along the southern shore of the island, and failed of accomplishing the design of their expedition. At last, the Caneans, despairing of relief from Venice, seeing three breaches made in their walls, through which the infidels might easily advance upon them, exhausted with fatigue and covered with wounds, and reduced to the number of 500 men, who were obliged to scatter themselves round the walls, which were half a league in extent, and undermined in all quarters, demanded a parley, and offered to capitulate. They obtained very honorable conditions; and after a glorious defence of two months, which cost the Turks more than 20,000 men, marched out of the city with the honors of war. Those citizens who did not choose to continue in the city were permitted to remove; and the Ottomans faithfully observed their stipulations.

The Venetians, after the loss of Canea, retired to Retimo. The captain pacha laid siege to the citadel of Suda, situated in the entrance of the bay, on a high rock, of about a quarter of a league in circumference. He raised earthen batteries, and made an ineffectual attempt to level its ramparts. At last, despairing of taking it by assault, he left some forces to block it up from all communication, and advanced towards Retimo. That city, being unwalled, was defended by a citadel, standing on an eminence which overlooks the harbour. General Cornaro had retired thither. At the approach of the enemy, he advanced from the city, and waited for them in the open field. During the action, he encouraged his soldiers, by fighting in the ranks. A glorious death was the reward of his valor; but his fall determined the fate of Retimo. The Turks having landed additional forces, they introduced the plague, which was almost a constant attendant on their armies. This dreadful pest destroyed most part of the inhabitants. The rest escaped into the Venetian territories, and the island was left almost desolate. The siege of the capital commenced in 1646, and was protracted much longer than that of Troy. For two years the Turks scarce gained any advantages before that city. They were often routed by the Venetians, and sometimes compelled to retire to Retimo. In 1649 Ussein Pacha, who blockaded Candia, receiving no supplies, owing to the revolutions at Constantinople by the deposition and death of Ibrahim, and accession of Mahomet IV. was compelled to raise the siege, and retreat to Canea. The Venetians were then on the sea with a strong squadron. They attacked the Turkish fleet in the bay of Smyrna, burnt twelve of their ships and two galleys, and killed 6000 of their men. Some time after, the Mahommedans having landed an army on Candia, renewed the siege of the city with greater vigor, and made themselves masters of an advanced fort that was very troublesome to the besieged; which obliged them to blow it up. From 1650 to 1658, the Venetians, continuing masters of the sea, intercepted the Turks every year in the straits of the Dardanelles, and fought them in four naval engagements; in which they defeated their numerous fleets, sunk a number of their caravels, took others, and extended the terror of their arms even to the walls of Constantinople. That capital became a scene of tumult and disorder The grand seignior, alarmed, left the city with precipitation. These great successes revived the hopes of the Venetians and depressed the courage of the Turks. The latter converted the siege of Candia into a blockade, and suffered considerable losses. The Sultan, to exclude the Venetian fleet from the Dardanelles, caused two fortresses to be built at the entrance of the straits. He ordered the pacha of Canea to appear again before the walls of Candia, and to make every possible effort to gain the city. In the meantime the Venetians made several attempts on Canea. In 1660 the city was about to surrender, when the pacha of Rhodes reinforced it with a body of 2000 men. He doubled the extremity of Cape Melec, within sight of the Venetian fleet, which was becalmed off Cape Spada, and could not advance one fathom to oppose an enemy considerably weaker than themselves. Kiopruli, knowing that the murmurs of the people against the long continuance of the siege of Candia were rising to a height, and fearing a general revolt, set out from Constantinople about the end of 1666, at the head of a formidable army. Having escaped the Venetian fleet, which was lying off Canea, he landed at Palio Castro, and formed the lines around Candia. Under his command were four pachas, and the flower of the Ottoman forces. Those troops, being encouraged by their chiefs, and supported by a great quantity of artillery, performed prodigies of valor. All the exterior forts were destroyed. Nothing now remained to the besieged but the bare line of the walls, unprotected by fortresses; and these being battered, by an incessant discharge of artillery, soon gave way on all quarters. Still, however, (incredible as it may apppear) the Candians held out three years against all the forces of the Ottoman empire. At last they were about to capitulate, when the hope of assistance from France re-animated their valor. The expected succours arrived on the 26th of June, 1669. They were conducted by the duke of Noailles. Next day the ardor of the French prompted them to make a general sally. The duke of Beaufort, admiral of France, assumed the command. He was the first to advance against the Mussulmans, and was followed by a numerous body of infantry and cavalry. They rushed furiously upon the enemy, forced the trenches, and would have compelled them to abandon their lines and artillery, had not an unforeseen accident damped their courage. In the midst of the engagement a powder magazine blew up; the duke of Beaufort and the foremost of the combatants lost their lives; the French ranks were broken, and fled in disorder; and the duke of Noailles with difficulty effected a retreat within the walls of Candia. The French accused the Italians of having betrayed them; and on that pretext prepared to set off sooner than the time agreed upon. No intreaties of the commandant could prevail with them to delay their departure. This determined the fate of the city, which had only 500 men left to defend it. Morosoni capitulated with Kiopruli, to whom he surrendered the kingdom of Crete, excepting only the Suda, Grabusa, and Spina-Longa. The grand vizier made his entrance into Candia, Oct. 4th, 1670; and stayed eight months in it, inspecting the reparation of its walls and fortresses. The three fortresses left in the hands of the Venetians continued long in their possession, but were all taken at last. In short, after a war of 30 years continuance, in the course of which more than 200,000 men fell, Candia was entirely subdued by the Turks, in whose hands it still continues.

Candia, the capital of the above island, is a fortified town, containing from 12,000 to 15,000 inhabitants, by far the greater part of whom are Turks. The houses are mean and irregular. The manufacture of soap is carried on very extensively here. The harbour, once large and commodious, is now very much choked with sand and will not admit more than ten merchantmen. The Governor is a pacha of three tails, and seraskier or military commandant of the whole island. Long 25° 4′ E., lat. 35° 16′ N.

CAN'DIDATE, *v. adj.* & *n.*
Can'did, *adj.*
Can'didly,
Can'didness,
Can'dour.

Fr. *candide*; Ital. *candida*; Span. *candido*; Lat. *candidus*; *candidus* is from *candeo*, as *lucidus* is from *luceo*. Thus, in addition to white, it is applied to any thing that is bright and glowing, as to snow recently fallen; to polished silver; to the light of a candle. In this sense, however, it is rare in English. In process of time it was employed to designate all persons, who are expectants of any office, in obtaining which the suffrages of others are required, because among the Romans such persons, on such occasions, wore a garment more white than ordinary *(candida toga)*. It is metaphorically applied to ingenuousness, openness of temper, purity of mind; without prejudice or malice; or sincere and unpretending goodness.

It presently sees the guilt of a sinful action; and, on the other side, observes the *candidness* of a man's very principles, and the sincerity of his intentions. *South.*

The box receives all back; but, poured from thence,
The stones came *candid* forth, the hue of innocence. *Dryden.*

Thy first-fruits of poesy were given
To make thyself a welcome inmate there,
While yet a young probationer,
And *candidate* of heaven. *Id.*

We have often desired they would deal *candidly* with us; for, if the matter stuck only there, we would propose that every one should swear, that is a member of the church of Ireland. *Swift.*

The import of the discourse will, for the most part, if there be no designed fallacy, sufficiently lead *candid* and intelligent readers into the true meaning of it. *Locke.*

A *candid* judge will read each piece of wit,
With the same spirit that its author writ. *Pope.*
What could thus high thy rash ambition raise?
Art thou, fond youth, a *candidate* for praise? *Id.*
So many *candidates* there stand for wit,
A place at court is scarce so hard to get. *Anonymous.*

One would be surprised to see so many *candidates* for glory. *Addison.*

But let untender thoughts afar be driven,
Nor venture to arraign the dread decree,
For know to man, as *candidate* for heaven,
The voice of the Eternal said, Be free! *Beattie.*

Yet are the darkened eye, the withered face,
Or hoary hair, I never will repine;
But spare, O time, whate'er of mental grace,
Of *candour*, love, or sympathy divine,
Whate'er of fancy's ray or friendship's flame is mine. *Id.*

CANDIDATES, in the college of physicians, London, is the order of members, out of whom the fellows are chosen. They must be natives of England, doctors of physic, admitted to the degrees in our own universities, and ought to have practised four years before they are admitted into the order.

CANDIDATI MILITES, an order of soldiers, among the Romans, who served as the emperor's body-guards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called candidati, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

CANDIDATI PRINCIPIS, were those who were recommended to any offices by the emperors. The candidatus principis was also an office in the court of the emperor of Constantinople, answering to a secretary of state among us.

CANDIDUS, in entomology, a species of cerambyx; color white, thorax and body fuscous, with two white stripes: its country unknown.

CAN'DIFY, *v. a.* Lat. *candifico*. To make white; to whiten.

CANDISH, a considerable province of **Asia**, in the dominions of the Great Mogul, bounded by Chytor and Malvo on the north, Orixa on the east, Deccan on the south, and Guzarat on the west. It is populous and rich; and abounds in cotton, rice, and Indigo. Brampore is the capital town. It is subject to the Poonah Mahrattas.

CANDITEERS, in fortification, frames to lay brushwood on to cover the workmen.

CAN'DLE, *n.*
CAN'DLE-BEAM,
CAN'DLE-CASE,
CAN'DLE-HOLDER,
CAN'DLE-LIGHT,
CAN'DLE-MINE,
CAN'DLE-SNUFF,
CAN'DLE-STICK,
CAN'DLE-STUFF,
CAN'DLE-TREES,
CAN'DLE-WASTER,
CAN'DLES'-ENDS.

Lat. *candela*; Ara. *gundel*; Per. *candel*; Fr. *chandelle*; supposed from *candidus*, white; but Goth. *kyndel*, from *kyndael*, is a fire-match; and *kyndil*, Sax. candel, a torch, a light; *καιω*, to burn. See KINDLE. The metaphorical beam of light is characterised according to the luminous body by or from which it is supposed to be protruded. It is hence that we speak of sun-beams and of moon-beams. Our ancestors spoke of candle-beams; and the sonneteer still sings of the lustre that beamed from the eye of his mistress. Candle-stick, Sax. condelsticca; condletreow is a stock or tree for a candle; that which holds the candle.

Candles'-ends, to drink off. A piece of romantic extravagance long practised by amorous gallants. It perhaps may be asked, why drinking off candles'-ends, for flap-dragons, should be esteemed an agreeable qualification? The answer is, that, as a feat of gallantry, to swallow a candles'-end formed a more formidable and disagreeable flap-dragon than any other substance, and therefore afforded a stronger testimony of zeal for the lady to whose health it was drank. See FLAP-DRAGON and DAGGERED ARMS.

Why doth the prince love him so then? Because he eats conger and fennel; and drinks off *candles'-ends* for flap-dragons. *Shakspeare.*

CANDLE-WASTERS; rakes who sit up all night, and therefore waste much candle. It certainly does not, as some have supposed, relate to the custom explained under the words candles'-ends; for a book-worm is called a candle-waster. See TODD.

Let wantons, light of heart
Tickle the senseless rushes with their heels;
For I am proverbed with a grandsire phrase,
To be a *candle-holder*, and look on. *Shakspeare.*

How far that little *candle* throws his beams!
So shines a good deed in a naughty world. *Id.*

The horsemen sit like fixed *candlesticks*,
With torch-staves in their hands; and their poor jades
Lob down their heads. *Id.*

By these blessed *candles* of the night,
Had you been there, I think you would have begged
The ring of me, to give the worthy doctor. *Id.*

Why, Petruchio is coming, in a new hat, and an old jerkin; a pair of old breeches, thrice turned; a pair of boots that had been *candle-cases*; an old rusty sword taken out of the town armory, with a broken hilt, and chapeless, with two broken points. *Id.*

CAN 88 CAN

Before the day was done, her work she sped,
And never went by candlelight to bed. *Dryd. Fab.*

The boding owl
Steals from her private cell by night,
And flies about the candlelight. *Swift.*

Such as are adapted to meals, will indifferently serve for dinners or suppers, only distinguishing between daylight and candlelight. *Id.*

Take a child, and, setting a *candle* before him, you shall find his pupil to contract very much, to exclude the light, with the brightness whereof it would otherwise be dazzled. *Ray.*

I know a friend, who has converted the essays of a man of quality into a kind of frame for his *candlesticks*. *Addison.*

I shall find him coals and *candlelight*. *Molineux to Locke.*

CANDLE. A tallow candle, to be good, must be part sheeps' and part bullocks' tallow. Hogs' tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an inconstant vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects. There are two sorts of tallow candles; the one dipped, the other moulded: the former are the common candles; the others the invention of the sieur le Brege at Paris. Candles are also made of spermaceti and wax.

CANDLE, MEDICATED. See BOUGIE.

CANDLE, SALE, or AUCTION BY INCH of, is when a small piece of candle, being lighted, the bystanders are allowed to bid for the merchandise that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder. This mode of sale seems to have been borrowed from the church of Rome, where there is an excommunication by inch of candle, when the sinner is allowed to come to repentance while the candle continues burning; but after it is consumed he remains finally excommunicated.

CANDLES. See CHANDLERY.

CANDLE BOMBS, a name given to small glass bubbles, having a neck about an inch long, with a very slender bore, by means of which a small quantity of water is introduced into them, and the orifice afterwards closed up. The stalk being put through the wick of a burning candle, the flame soon rarifies the water into steam, by the

Now that the winter 's gone, the earth hath lost
Her snow-white robes, and now no more the frost
Candies the grass, or casts an icy cream
Upon the silver lake or chrystal stream;
But the warm sun thaws the benumbed earth,
And makes it tender; gives a second birth
To the dead swallow; wakes in hollow tree
The drowsy cuckoo and the humble-bee.
Carew. The Spring.

They have in Turkey confections like to candied conserves, made of sugar and lemons, or sugar and citrons, or sugar and violets, and some other flowers, and mixture of amber. *Bacon.*

With candy'd plantanes, and the juicy pine,
On choicest melons and sweet grapes they dine.
Waller.

CA'NDY; LION'S FOOT. See CATANANCHE.

CANDY, or SUGAR CANDY, a preparation of sugar made by melting and crystallising it six or seven times over, to render it hard or transparent. It is of three kinds: white, yellow, and red. The white comes from the loaf-sugar, the yellow from the cassonade, the brown from the muscavado.

CANDY, a kingdom of Asia, in the centre of the island of Ceylon, is separated from the country possessed by Europeans on the coast by almost impenetrable woods and mountains. The passes are extremely steep and difficult, and so little known, even to the natives, that the exact dimensions of these dominions have never been ascertained. The climate is particularly unhealthy to Europeans on account of the heavy fogs which prevail.

The country is divided into provinces and districts. A high range of mountains extends across the whole country, and divides the island into two different climates. On one side the rains are incessant, and on the other there has been a continued drought for several years. Several rivers intersect the country, but they are rendered unnavigable by the very rapid current during the rainy season, and they are almost dried up during the summer months. The Candians are divided into castes; the nobles form the first or highest rank,—the second includes the better artificers, such as goldsmiths, painters, &c.—the third the meaner kind of artificers, as barbers, weavers, and the common soldiers; the laborers of all descriptions and the peasantry are included in the fourth caste. They worship the idol Buddha.

The government is despotic, and supported by presents or contributions brought by the people, or rather enforced by the king's officers. They consist of money, corn, fruit, precious stones, and all articles of their own manufacture. The submission of the subject to the sovereign is almost unbounded. The former never dares appear on horseback; indeed this animal is only kept in the royal stud.

The capital (see below) has been frequently attacked by Europeans and again given up. It was taken by the Dutch in 1766, but they only kept possession about nine months. In 1802 a war again broke out, and the Candians submitted to the English army of 3000 men, under the command of Major Mendarval, who left here Major Davie, with a garrison. The garrison, however, being small, they soon suffered very materially from the climate, and were obliged to surrender, on condition of being allowed to march to Trincomalee. This treacherous people, however, left [illegible] and cruelly murdered the greater part of them in cold blood. Another expedition failed in 1803, but a third was resolved upon in 1815, and an army of [illegible] men took possession of the capital. In March, 1815, the monarch, Wikrama Raja Sinha, was finally deposed, and the kingdom annexed to the British dominions.

CANDY, the capital of the Candian dominions, about 112 miles from Trincomalee, and 108 from Columbo, stands on a plain, surrounded by mountains covered with thick jungle and almost impenetrable woods. The town is, as it were, fortified by a thick thorn hedge, and is approached by difficult narrow passes, guarded by gates of the same materials. The town stands near the banks of the river Mahavillaganga, and is formed of one principal street, about two miles long, with narrow lanes branching from it. At the extremity of the street is the palace, containing a great number of apartments, some of them curiously painted, and others ornamented with plate glasses. The principal building consists of two squares, one within the other; the interior is the royal residence. The houses of the town are very mean. Long. 80° 47′ E., lat. 7° 23′ N. See CEYLON.

CANE, n. & v. t. } Kanah; Lat. canna. A
CA'NY. } kind of strong reed, of which walking staffs are made; a walking-staff. A lance; a staff made of cane, whence the Spanish juego de cannas. The plant which yields the sugar. To beat with a walking-stick. Cany signifies full of canes, or consisting of canes.

Shall I to please another wine-sprung mind
Lose all mine own; God hath given me a measure
Short of his cane and body; must I find
A pain in that wherein he finds a pleasure? *Herbert.*

But in his way lights on the barren plains
Of Sericana, where Chineses drive
With sails and wind their cany waggons light. *Milton.*

The king thrust the captain from him with his cane, whereupon he took his leave, and went home. *Harvey.*

Alexander, the youth these sports has known,
Of whom the cup is now spectator grown;
Judge-like thou sit'st, to praise or to arraign
The flying skirmish of the darted cane. *Dryden.*

If the poker be out of the way, or broken, stir the fire with your master's cane. *Swift.*

If the strong cane support thy walking hand,
Chairmen no longer shall the wall command.
Gay's Trivia.

This cane or reed, grows plentifully both in the East and West Indies. Other reeds have their skin hard and dry, and their pulp void of juice; but the skin of the sugarcane is soft. It usually grows ten or five feet high, and about half an inch in diameter. The stem or stalk is divided by knots a foot and a half apart. At the top it puts forth long green tufted leaves, from the middle of which arise the flower and the seed. They usually plant them in pieces a foot and a half long, below the top of the flower; and they are ordinarily ripe in ten months, at which time they are found quite full of a white succulent marrow, whence is expressed the liquor of which sugar is made. *Chambers.*

And the sweet liquor on the cane bestow,
From which prepared the luscious sugars flow.
Blackmore.

Ambition! does ambition there reside?
Yes! when the boy in manly mood astride,
Of headstrong prowess innocently vain,
Canters, the jockey of his father's *cane*. *Bishop.*

Cane, Grotto Del, i. e. the dog's grotto, a cave of Naples, seven miles from Puzzoli, where many dogs have been suffocated to show the effect of a mephitic vapor, which rises a foot above the bottom of this grotto.

Cane, in botany. See Arundo.

Cane, Sugar. See Saccharum

CANELLA, in botany, a genus of the monogynia order, and dodecandria class of plants, natural order twelfth, holoraceæ: cal. three-lobed; the petals five; the antheræ twelve to twenty-one, growing on an urceolated or bladder-shaped nectarium; and the fruit is a trilocular berry with two seeds. There is but one known species, C. alba. It grows usually about twenty feet high, and eight or ten inches in thickness, in most of the Bahama islands. The leaves are narrow at the stalk, growing wider at their ends, which are broad and rounding, having a middle rib only; they are very smooth, and of a light shining green. The whole plant is very aromatic, the bark particularly, being used in distilling, and in greater esteem in the more northern parts of the world than in Britain. The bark is the canella alba of the shops. It is brought to us rolled up into long quills, thicker than the cinnamon, and both outwardly and inwardly of a whitish color, lightly inclining to yellow. Infusions of it in water are of a yellowish color, and smell of the canella: but they are rather bitter than aromatic. Tinctures in rectified spirit have the warmth of the bark, but little of its smell. Proof spirit dissolves the aromatic as well as the bitter matter of the canella, and is therefore the best menstruum. This bark is a warm pungent aromatic, though not of the most agreeable kind: nor are any of the preparations of it very grateful. Canella alba is often employed where a warm stimulant to the stomach is necessary, and as a corrigent of other articles. It is now, however, little used in composition by the London College; the only officinal formula which it enters being the pulvis aloeticus; but with the Edinburgh College it is an ingredient in the tinctura amaro, vinum amarum, vinum rhei, as it is useful as covering the taste of some other articles.

CANEPHORIA, a ceremony celebrated by the Athenian virgins on the eve of their marriage day, in which the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of little curiosities, as presents to Diana, to engage her to make the marriage state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honorable amends made to that goddess, the protectrix of virginity, for abandoning her party; or as a ceremony to appease her wrath. Suidas calls it a festival in honor of Diana. Canephoria was also a festival in honor of Bacchus, celebrated particularly by the Athenians, in which the young maids carried golden baskets full of fruit, covered to conceal the mystery from the uninitiated.

CANES, in Egypt and other eastern countries, a poor sort of buildings for the reception of strangers and travellers, who are accommodated with a room at a small price, but with no other necessaries; so that, excepting the room, there are no greater accommodations in these houses than in the deserts except that there is a market near.

Canes Venatici, in astronomy, the greyhounds, two new constellations first established by Hevelius, between the tail of the Great Bear and the arms of Bootes, above the Coma Berenices. The first is called asterion, being next the Bear's tail; the other chara

CANGA, in the Chinese affairs, a wooden clog borne on the neck by way of punishment for divers offences The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offence. Some cangas weigh 200lbs.; the generality from fifty to sixty. The mandarins condemn to the punishment of the canga Sentence of death is sometimes changed for this kind of punishment.

CANGE (Sieu Du). See Fresne Du.

CANGIAGIO, or Cambiasi, (Lewis), one of the most eminent of the Genoese painters, was born in 1527. His works at Genoa are very numerous; and he was employed by the king of Spain to adorn part of the Escurial. He was not only expeditious, but worked equally well with both hands; and, by that unusual power, executed more designs, and finished grand works with his own pencil, in a much shorter time, than most other artists could do with several assistants. At the age of seventeen, being employed in painting the front of an elegant house, in fresco, on his entering on the scaffold the other artists concluded from his youth that he could be nothing more than a grinder of colors, and, therefore, when he took up the pallet, they attempted to prevent him, being apprehensive that he would spoil the work, but after a few strokes of his pencil they acknowledged their mistake, and allowed him to proceed. He died in 1585.

CANICULA, in astronomy, a star in the constellation canis major, called also the dog-star; by the Greeks Σειριος, Sirius. It is the tenth in order in the Britannic catalogue; in Tycho's and Ptolemy's it is the second It is situated in the mouth of the constellation, and is of the first magnitude, being the largest and brightest star in the heavens. From the rising of this star not cosmically, or with the sun, but heliacally, that is, its emersion from the sun's rays, the ancients reckoned their dies caniculares, canicular days, or dog days. The Egyptians and Ethiopians began their year at the rising of the canicula, reckoning to its rise again the next year. The reason of their choice of the canicula, before the other stars, to compute their time by, was not only the superior brightness of that star, but because its heliacal rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile. Ephestion adds, that from the aspect and color of canicula the Egyptians drew prognostics concerning the rise of the Nile; and, according to Florus, predicted the future state of the year; so that the first rising of this star annually observed with great attention.

CANIC'ULAR, *adj.* Lat. *canicularis.* Belonging to the dog-star; as canicular, or dog days.

In regard to different latitudes, unto some the *canicular* days are in the winter, as unto such as are under the equinoctial line; for unto them the dog-star ariseth, when the sun is about the tropick of Cancer, which season unto them is winter. *Browne's Vul. Err.*

CANICULUM, or CANICULUS, in the Byzantine antiquities, a golden standish or ink vessel, decorated with precious stones, wherein was kept the sacred encaustum, or red ink, wherewith the emperors signed their decrees, letters, &c. The name alludes to the figure of a dog which it represented, or rather because it was supported by the figures of dogs. The caniculum was under the care of a particular officer of state.

CANINANA, in zoology, a species of serpent found in America, and esteemed one of the less poisonous kinds. It grows to about two feet long; and is green on the back, and yellow on the belly. It feeds on eggs and small birds: the natives cut off the head and tail, and eat the body as a delicate fish.

CANINE', *adj.* Lat. *caninus.* Having the properties of a dog. Canine hunger, or bulimia, in medicine, is an appetite that cannot be satisfied.

A kind of women are made up of *canine* particles: these are scolds, who imitate the animals out of which they were taken, always busy and barking, and snarl at every one that comes in their way. *Addison.*

It may occasion an exorbitant appetite of usual things, which they will take in such quantities, till they vomit them up like dogs; from whence it is called *canine.* *Arbuthnot.*

CANINE MADNESS. See MEDCINE.

CANINE TEETH, are two sharp edged teeth in each jaw: one on each side, placed between the incisores and molares.

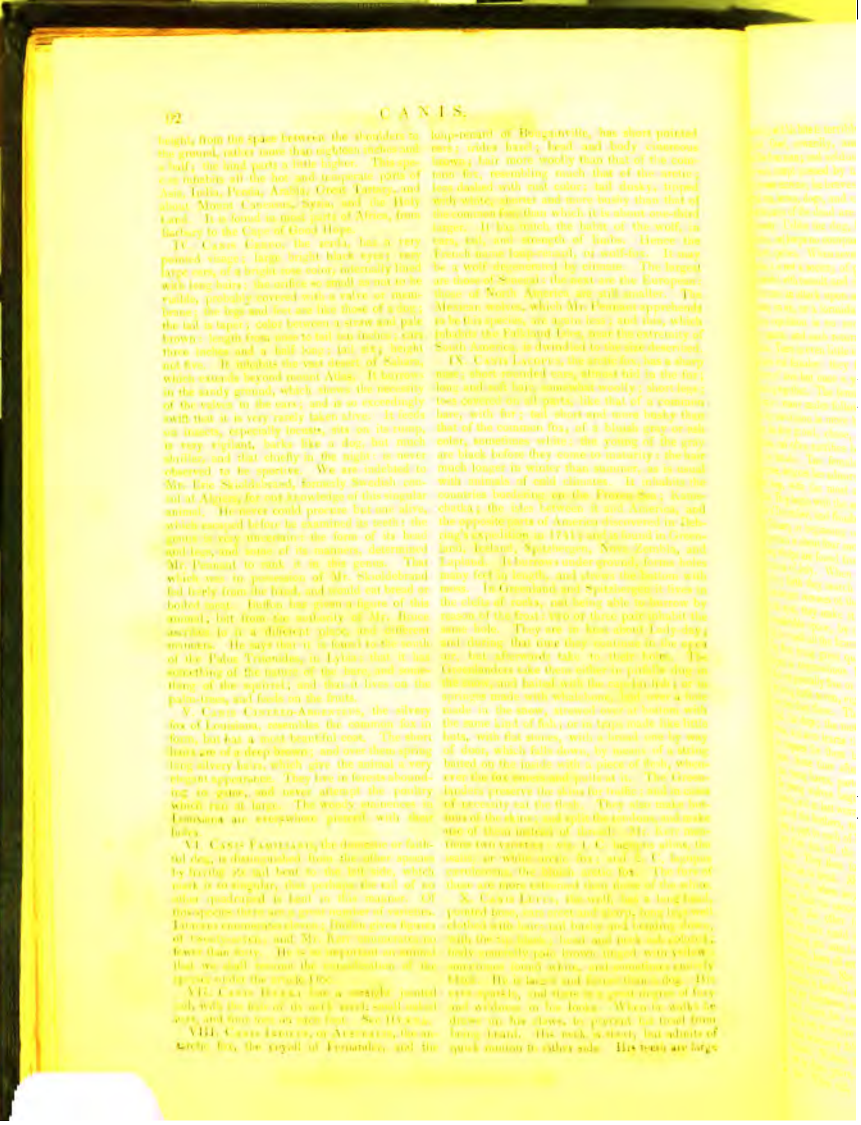
CANINI (John Angelo and Mark Anthony), two brothers, natives of Rome, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads; Mark engraved them. They were encouraged by Colbert to publish a succession of heads of the heroes and great men of antiquity, designed from medals, antique stones, and other ancient remains; but John died at Rome soon after the work was begun: Mark Anthony, however, procured assistance, finished and published it in Italian, in 1669. The cuts of this edition were engraved by Canini, Picard, and Valet; and a curious explanation is given, which discovers the skill of the Caninis in history and mythology. The French edition of Amsterdam, 1731, is spurious.

CANIS, in zoology, the dog, a genus of quadrupeds, belonging to the order of feræ. The characters of the dog are these: six fore-teeth in the upper jaw, those in the sides longer than the intermediate ones, which are lobated; in the under jaw there are also six fore-teeth, those on the sides being lobated. He has six grinders in the upper, and seven in the lower jaw. The teeth called dog-teeth are four, one on each side, both in the lower and upper jaw, sharp-pointed, bent a little inward, and at a distance from any of the rest. Zoologists commonly reckon fourteen species of this genus. Mr. Kerr, in his Animal kingdom, enumerates seventeen: but zoological arrangement seems not yet to have arrived at its perfection. Mr. Pennant, with considerable propriety (as Mr. Kerr remarks), excludes all the hyenæ from this genus. Indeed to ordinary readers it must appear somewhat strange, to class animals of such very opposite natures as the fox, the wolf, and the hyenæ, under the same genus with the dog. Adopting Mr. Kerr's arrangement in general, we state the different species and varieties as follows:—

I. CANIS ADIVE, the barbary fox, or chacal of Buffon, the jackal adive, has a long and slender nose, sharp upright ears, long bushy tail; color, a very pale brown; space above and below the eyes black; from behind each ear there is a black line, which soon divides into two, which extend to the lower part of the neck; and the tail is surrounded with three broad rings. This species is of the size of the common fox, but the limbs are shorter, and the nose is more slender.

II. CANIS ANTARCTICUS, the new Holland dog, or dog of New South Wales, is thus described by Mr. Kerr:—'the tail is bushy and hangs downwards; the ears are short and erect; and the muzzle is pointed. It inhabits New Holland; is rather less than two feet high; and about two feet and a half in length. His head resembles that of a fox, having a pointed muzzle, garnished with whiskers, and short erect ears; the body and tail light brown; paler towards the belly, on the sides of the face and throat. The hind parts of the fore-legs, the fore parts of the hind-legs, and all the feet, are white. On the whole it is a very elegant, but fierce and cruel, animal; from which, with its figure, the total want of the common voice of the dog, and from general resemblance in other respects, it seems more properly to belong to the wolf kind.'

III. CANIS AUREUS, the schackal, or jackal, as described by Pennant, has yellowish brown irides; ears erect, formed like those of a fox, but shorter and less pointed; hairy, with white within; brown without, tinged and dusky: head shorter than that of a fox, and nose blunter: lips black, and somewhat loose: neck and body very much resembling those of that animal, but the body more compressed; the legs have the same resemblance, but are longer: tail thickest in the middle, tapering to the point: five toes on the fore-feet, the inner toe very short, and placed high: four toes on the hind feet, all covered with hair even to the claws. The hairs are much stiffer than those of a fox, but scarcely so stiff as those of a wolf; short about the nose; on the back three inches long; on the belly shorter: those at the end of the tail four inches long: color of the upper part of the body a dirty tawny; on the back, mixed with black: lower part of the body of a yellowish white: tail tipt with black; the rest of the same color with the back: the legs of an unmixed tawny brown: the fore-legs marked (but not always) with a black spot on the knees; but on no part are those vivid colors which could merit the title of golden, bestowed on it by Kæmpfer. The length from the nose to the root of the tail is little more than twenty-nine inches English: the tail, to the ends of the hairs, ten inches and three quarters, the tip reaching to the top of the hind legs: the



height, from the space between the shoulders to the ground, rather more than eighteen inches and a half; the hind parts a little higher. This species inhabits all the hot and temperate parts of Asia, India, Persia, Arabia, Great Tartary, and about Mount Caucasus, Syria, and the Holy Land. It is found in most parts of Africa, from Barbary to the Cape of Good Hope.

IV. CANIS CERDO, the zerda, has a very pointed visage; large bright black eyes; very large ears, of a bright rose color, internally lined with long hairs; the orifice so small as not to be visible, probably covered with a valve or membrane; the legs and feet are like those of a dog; the tail is taper; color between a straw and pale brown: length from nose to tail ten inches; ears three inches and a half long; tail six; height not five. It inhabits the vast desert of Sahara, which extends beyond mount Atlas. It burrows in the sandy ground, which shews the necessity of the valves to the ears; and is so exceedingly swift that it is very rarely taken alive. It feeds on insects, especially locusts, sits on its rump, is very vigilant, barks like a dog, but much shriller, and that chiefly in the night: is never observed to be sportive. We are indebted to Mr. Eric Skioldebrand, formerly Swedish consul at Algiers, for our knowledge of this singular animal. He never could procure but one alive, which escaped before he examined its teeth: the genus is very uncertain: the form of its head and legs, and some of its manners, determined Mr. Pennant to rank it in this genus. That which was in possession of Mr. Skioldebrand fed freely from the hand, and would eat bread or boiled meat. Buffon has given a figure of this animal; but from the authority of Mr. Bruce ascribes to it a different place, and different manners. He says that it is found to the south of the Palus Tritonidis, in Lybia; that it has something of the nature of the hare, and something of the squirrel; and that it lives on the palm-trees, and feeds on the fruits.

V. CANIS CINEREO-ARGENTEUS, the silvery fox of Louisiana, resembles the common fox in form, but has a most beautiful coat. The short hairs are of a deep brown; and over them spring long silvery hairs, which give the animal a very elegant appearance. They live in forests abounding in game, and never attempt the poultry which run at large. The woody eminences in Louisiana are everywhere pierced with their holes.

VI. CANIS FAMILIARIS, the domestic or faithful dog, is distinguished from the other species by having its tail bent to the left side, which mark is so singular, that perhaps the tail of no other quadruped is bent in this manner. Of this species there are a great number of varieties. Linnæus enumerates eleven; Buffon gives figures of twenty-seven, and Mr. Kerr enumerates no fewer than forty. He is so important an animal that we shall reserve the consideration of the species under the article DOG.

VII. CANIS HYÆNA has a straight jointed tail, with the hair of its neck erect; small naked ears, and four toes on each foot. See HYÆNA.

VIII. CANIS [illegible], or AUSTRALIS, the antarctic fox, the [illegible] of Fernandez, and the loup-renard of Bougainville, has short pointed ears; irides hazel; head and body cinereous brown; hair more woolly than that of the common fox, resembling much that of the arctic; legs dashed with rust color; tail dusky, tipped with white, shorter and more bushy than that of the common fox; than which it is about one-third larger. It has much the habit of the wolf, in ears, tail, and strength of limbs. Hence the French name loup-renard, or wolf-fox. It may be a wolf degenerated by climate. The largest are those of Senegal: the next are the European: those of North America are still smaller. The Mexican wolves, which Mr. Pennant apprehends to be this species, are again less; and this, which inhabits the Falkland Isles, near the extremity of South America, is dwindled to the size described.

IX. CANIS LAGOPUS, the arctic fox, has a sharp nose; short rounded ears, almost hid in the fur; long and soft hair, somewhat woolly; short legs; toes covered on all parts, like that of a common hare, with fur; tail short and more bushy than that of the common fox, of a bluish gray or ash color, sometimes white; the young of the gray are black before they come to maturity: the hair much longer in winter than summer, as is usual with animals of cold climates. It inhabits the countries bordering on the Frozen Sea; Kamschatka; the isles between it and America, and the opposite parts of America discovered in Behring's expedition in 1741; and is found in Greenland, Iceland, Spitzbergen, Nova Zembla, and Lapland. It burrows under ground, forms holes many feet in length, and strews the bottom with moss. In Greenland and Spitzbergen it lives in the clefts of rocks, not being able to burrow by reason of the frost: two or three pair inhabit the same hole. They are in heat about Lady-day; and during that time they continue in the open air, but afterwards take to their holes. The Greenlanders take them either in pitfalls dug in the snow, and baited with the capelin fish; or in springes made with whalebone, laid over a hole made in the snow, strewed over at bottom with the same kind of fish; or in traps made like little huts, with flat stones, with a broad one by way of door, which falls down, by means of a string baited on the inside with a piece of flesh, whenever the fox enters and pulls at it. The Greenlanders preserve the skins for traffic; and in cases of necessity eat the flesh. They also make buttons of the skins; and split the tendons, and make use of them instead of thread. Mr. Kerr mentions two varieties: viz. 1. C. lagopus albus, the snowy, or white arctic fox; and 2. C. lagopus cærulescens, the bluish arctic fox. The furs of these are more esteemed than those of the white.

X. CANIS LUPUS, the wolf, has a long head, pointed nose, ears erect and sharp, long legs well clothed with hair; tail bushy and bending down, with the tip black; throat and neck ash colored; body generally pale brown, tinged with yellow; sometimes found white, and sometimes entirely black. He is larger and fiercer than a dog. His eyes sparkle, and there is a great degree of fury and wildness in his looks. When he walks he draws in his claws, to prevent his tread from being heard. His neck is stiff, but admits of quick motion to either side. His teeth are large and sharp; and his bite is terrible, as his strength is great. Cruel, cowardly, and suspicious, the wolf flies from man; and seldom ventures out of the woods, except pressed by hunger: but when this becomes extreme, he braves danger, and will attack men, horses, dogs, and cattle of all kinds; even the graves of the dead are not proof against his rapacity. Unlike the dog, he is an enemy to all society, and keeps no company even with those of his own species. When several wolves appear together, it is not a society of peace, but of war; it is attended with tumult and dreadful howlings, and indicates an attack upon some large animal, as a stag, an ox, or a formidable mastiff. This military expedition is no sooner finished than they separate, and each returns in silence to his solitude. There is even little intercourse between the males and females: they feel the mutual attractions of love but once a year, and never remain long together. The females come in season in winter: many males follow the same female; and this association is more bloody than the former; for they growl, chase, fight, and tear one another, and often sacrifice him that is preferred by the female. The female commonly flies a long time, fatigues her admirers, and retires while they sleep, with the most alert or most favorite male. They begin with the old females about the end of December, and finish with the young ones in February or beginning of March. The time of gestation is about four months and a half; and young whelps are found from the end of April to the month of July. When the females are about to bring forth they search for a concealed place in the inmost recesses of the forest. After fixing on the spot, they make it smooth and plain for a considerable space, by cutting and tearing up with their teeth all the brambles and brush-wood. They then bring great quantities of moss, and prepare a commodious bed for their young, which are generally five or six, though sometimes they bring forth seven, eight, and even nine, but never less than three. They come into the world blind, like dogs; the mother suckles them some weeks, and soon learns them to eat flesh, which she prepares for them by tearing it into small pieces. Some time after she brings them field mice, young hares, partridges, and other fowls. The young wolves begin by playing with these animals, and at last worry them; then the mother pulls off the feathers, tears them in pieces, and gives a part to each of her young. They never leave their den till the end of six weeks or two months. They then follow their mother, who leads them to drink. She conducts them back to the den, or, when any danger is apprehended, obliges them to conceal themselves elsewhere. Though, like other females, the she wolf is naturally more timid than the male; yet, when her young are attacked, she defends them with intrepidity, loses all sense of danger, and becomes perfectly furious. She never leaves them till their education is finished, till they are so strong as to need no assistance or protection, and have acquired talents for rapine, which generally happens in ten or twelve months after their first teeth (which commonly fall out in the first month) are replaced. Wolves are full grown at the end of two or three years, and live fifteen or twenty years. When old, they turn whitish, and their teeth are much worn. They sleep, but more during the day than the night, and it is always a slight slumber. They drink often; and, in the time of drought, when there is no water in the hollows, or in the trunks of old trees, they repair, several times in a day, to the brooks or rivulets. Though extremely voracious, if supplied with water, they can pass four or five days without meat. The wolf has great strength, especially in the anterior parts of the body, in the muscles of the neck and jaws. He carries a sheep in his mouth, and, at the same time, outruns the shepherds; so that he can only be stopped or deprived of his prey by dogs. His bite is cruel, and always more obstinate in proportion to the smallness of the resistance; for, when an animal can defend itself, he is cautious and circumspect. He never fights but from necessity. When wounded with a ball, he cries; and yet, when despatching him with bludgeons, he complains not. When he falls into a snare, he is so overcome with terror, that he may either be killed or taken alive without resistance: he allows himself to be chained, muzzled, and led any where, without exhibiting the least symptom of resentment or discontent. The senses of the wolf are excellent, but particularly that of smelling, which often extends farther than his eye. The odor of carrion strikes him at the distance of more than a league. He likewise scents live animals very far, and hunts them a long time by following their track. When he issues from the wood, he never loses the wind. He stops upon the borders of the forest, smells on all sides, and receives the emanations of living or dead animals; brought to him from a distance by the wind. Though he gives the preference to living animals; yet he devours the most putrid carcases. He is fond of human flesh; and, if stronger, he would perhaps eat no other. Wolves have been known to follow armies, to come in troops to the field of battle, where bodies are carelessly interred, to tear them up, and to devour them with an insatiable avidity. And, when once accustomed to human flesh, are said ever after to attack men. Wolves of this vicious disposition are called loups garoux by the French peasants, who suppose them to be possessed with some evil spirits; and of this nature were the were-wulfs of the old Saxons. The wolf inhabits the continents of Europe, Asia, Africa, and America; Kamtschatka, and even as high as the arctic circle. Those of North America are the smallest; and, when reclaimed, are the dogs of the natives: the wolves of Senegal are the largest and fiercest; they prey in company with the lion. They are found in Africa as low as the Cape. In the east, and particularly in Persia, wolves are exhibited as spectacles to the people. When young, they are learned to dance, or rather to perform a kind of wrestling with a number of men. Buffon brought up several of them: 'When young, or during the first year,' he informs us, 'they are very docile, and even caressing; and, if well fed, neither disturb the poultry nor any other animal: but at the age of eighteen months or two years, their natural ferocity appears, and they must be chained to prevent them from running off and doing mischief. I brought up one till the age of eighteen or nineteen months, in a court along with fowls none of which he ever attacked; but, for his first essay, he killed the whole in one night, without eating any of them. Another, having broken his chain, ran off, after killing a dog with whom he had lived in great familiarity.' In England king Edgar is said first to have attempted the extirpation of wolves, by commuting the punishments of certain crimes into the acceptance of a certain number of wolves' tongues from the criminal; and in Wales, by converting the tax of gold and silver into an annual tax of 300 wolves' heads. We find, however, that some centuries after the reign of this monarch, these animals were increased to such a degree as to become again the object of royal attention: accordingly Edward I. issued his royal mandate to Peter Corbet to superintend and assist in the destruction of them in the several counties of Gloucester, Worcester, Hereford, Salop, and Stafford; and in the adjacent county of Derby, certain persons at Wormhill, says Camden, held their lands by the duty of hunting and taking the wolves that infested the country, whence they were styled wolvehunt. Farther back, in Athelstan's reign, wolves abounded so much in Yorkshire, that a retreat was built at Flixton, in that county, 'to defend passengers from the wolves, that they should not be devoured by them:' and such ravages did those animals make during winter, particularly in January, when the cold was severest, that the Saxons distinguished that month by the name of the wolf month. They also called an outlaw wolf's-head, as being out of the protection of the law, proscribed, and as liable to be killed as that destructive beast.

Ireland was infested by wolves for many centuries after their extinction in England; for there are accounts of some being found there as late as 1710, the last presentment for killing of wolves being made in the county of Cork about that time. In many parts of Sweden the number of wolves has been considerably diminished by placing poisoned carcases in their way: but in other places they are found in great multitudes. Hunger sometimes compels them to eat lichens: these vegetables were found in the body of one killed by a soldier; but it was so weak, that it could scarcely move. It probably had fed on the lichen vulpinus, which is a known poison to these animals. Madness, in certain years, is apt to seize the wolf. The consequences are often very melancholy. Mad wolves will bite hogs and dogs, and the last again the human species. The symptoms are the same with those attendant on the bite of a mad dog. Fury sparkles in their eyes; a glutinous saliva distils from their mouths; they carry their tails low, and bite indifferently men and beasts. It is remarkable that this disease happens in the depth of winter. Often, towards spring, wolves get upon the ice of the sea, to prey on the young seals, which they catch asleep: but this repast often proves fatal to them; for the ice, detached from the shore, carries them to a great distance from land, before they are sensible of it. In some years a large district is by this means delivered from these pernicious beasts; which are heard howling in a most dreadful manner, far in the sea. When wolves come to make their attack on cattle, they never fail attempting to frighten away the men by their loud cries; but the sound of the horn makes them fly. There is nothing valuable in the wolf but his skin, which makes a warm durable fur. His flesh is so bad, that it is rejected with abhorrence by all other quadrupeds; no animal but a wolf will voluntarily eat a wolf. The smell of his breath is exceedingly offensive. As, to appease hunger, he swallows indiscriminately everything he can find, corrupted flesh bones, hair, skins half tanned and covered with lime, he vomits frequently. In fine, the wolf is consummately disagreeable; his aspect is base and savage, his voice dreadful, his odor insupportable, his disposition perverse, his manners ferocious; odious and destructive when living, and, when dead, perfectly useless, except for his fur. Mr. Kerr enumerates four other varieties of this species, viz. 2. C. lupus albus, the white wolf, found near the Jenisea, in the eastern parts of Asiatic Russia, much valued on account of its fur. 3. C. lupus fasciatus, the striped wolf. It is of a gray color striped with black, and inhabits the Cape of Good Hope. 4. C. lupus flavus, the yellow wolf, found in France and Germany, having a thicker fur, and more yellow color than the common kind. It is more wild, but less destructive, as it never troubles the flocks, or the habitations of men. 5. C. lupus niger, the black wolf. This variety inhabits Canada, and is of a uniform black color. It is not so long as the common kind; the ears are larger, more erect and more distant, but in every other circumstance it resembles the common European wolf.

XI. Canis Mesomelas, the capesch of Schreber, the tenlie, or kenlie, of the Hottentots, the Cape jackal, has erect yellowish brown ears, mixed with a few scattered black hairs: the head is of a yellowish brown, mixed with black and white, growing darker towards the hind part; the sides are of a light brown, varied with dusky hairs: the body and also the back part of the legs are of a yellowish brown, lightest on the body; the throat, breast, and belly white. On the neck, shoulders, and back, is a band of black. The tail is bushy, of a yellowish brown: marked on the upper part with a longitudinal stripe of black, and towards the end encircled with two rings of black, and is tipt with white. In length, the animal is two feet and three quarters, to the the origin of the tail: the tail is one foot. It inhabits the countries about the Cape of Good Hope, and is found as high as the line.

XII. Canis Mexicanus, has a smooth tail, bent downwards. The body is ash colored, variegated with dusky stripes and tawny spots, on the forehead, neck, breast, belly, and tail. Its head is large, and neck thick. It has great jaws and strong teeth. Above its mouth are bristles as large, but not so hard, as the spines of a hedgehog. Seba calls it the quauhpecolti, or mountain cat; and Hernandes stiles it the xoloitcuintli, or Mexican wolf. It inhabits the warm parts of Mexico and New Spain, and agrees with the European wolf in its manners; whence it is also called lupus, though ranked as a different species. There is also a white Mexican wolf.

XIII. Canis Thous, or the Surinam wolf,

has a smooth tail bent downwards. The body is gray on the upper and white on the under parts. Its face has a wart over each eye, on each cheek, and under the throat. It is about the size of a large cat; and, according to Linnæus, is found at Surinam. It is mentioned also by Pennant.

XIV. CANIS VIRGINIANUS, the gray fox of Catesby, &c. has a sharp nose; sharp, long, upright ears; legs long; color gray, except a little redness about the ears. It inhabits Carolina, and the warmer parts of North America, and differs from the arctic fox in form, and the nature of its dwelling: agreeing with the common fox in the first, but not in the last. It never burrows, but lives in hollow trees; it gives no diversion to the sportsman; for after a mile's chase, it takes to its retreat; it has no strong smell; it feeds on poultry, birds, &c. These foxes are easily made tame; their skins, when in season, are used for muffs.

XV. 1. CANIS VULPES, the common fox, has a straight tail, white at the point. His body is yellowish, or rather straw-colored; his ears are small and erect; his lips are whitish, and his fore feet black. From the base of the tail a strong scent is emitted, which to some people is very fragrant, and to others extremely disagreeable. The fox is a native of almost every quarter of the globe, and is of such a wild and savage nature, that it is impossible fully to tame him. He is esteemed the most sagacious and crafty of all beasts of prey. The former quality he shows in his method of providing himself with an asylum, where he retires from pressing dangers, dwells, and brings up his young: and his craftiness is chiefly discovered by the schemes he falls upon to catch lambs, geese, hens, and all kinds of small birds. The fox fixes his abode on the border of the wood, in the neighbourhood of cottages: he listens to the crowing of the cocks and the cries of the poultry. He scents them at a distance; he chooses his time with judgment; he conceals his road as well as his design: he slips forward with caution, sometimes even trailing his body, and seldom makes a fruitless expedition. If he can leap the wall, or get in underneath, he ravages the poultry yard, puts all to death, and then retires softly with his prey, which he either hides under the herbage, or carries off to his kennel. He returns in a few minutes for another, which he carries off, or conceals in the same manner, but in a different place. In this way he proceeds till the progress of the sun, or some movements in the house, advertise him that it is time to retire to his den. He plays the same game with the catchers of thrushes, woodcocks, &c. He visits the nets and bird-lime very early in the morning, carries off successively the birds which are entangled, and lays them in different places, especially near the sides of highways, in the furrows, under the herbage or brushwood, where they sometimes lie two or three days; but he knows perfectly where to find them when he is in need. He hunts the young hares in the plains, seizes old ones in their seats, never misses those which are wounded, digs out the rabbits in the warrens, discovers the nests of partridges and quails, seizes the mothers on the eggs, and destroys a vast quantity of game. The fox is exceedingly voracious; besides flesh of all kinds, he eats, with equal avidity, eggs, milk, cheese, fruits, and particularly grapes. When the young hares and partridges fail him, he makes war against rats, field mice, serpents, lizards, toads, &c. Of these he destroys vast numbers; and this is the only service he does to mankind. He is so fond of honey, that he attacks the wild bees, wasps, and hornets. They at first put him to flight by a thousand stings; but he retires only for the purpose of rolling himself on the ground to crush them; and he returns so often to the charge, that he obliges them to abandon the hive, which he soon uncovers, and devours both the honey and wax. In a word he eats fish, lobsters, grasshoppers, &c. The fox is not easily, and never fully tamed: he languishes when deprived of liberty; and, if kept too long in a domestic state, he dies of chagrin. Foxes produce but once a year; and the litter commonly consists of four or five, seldom six, and never less than three. When the female is full, she retires, and seldom goes out of her hole, where she prepares a bed for her young. She comes in season in the winter; and young foxes are found in the month of April. When she perceives that her retreat is discovered, and that her young have been disturbed, she carries them off one by one, and goes in search of another habitation. The young are brought forth blind; like the dog's, they grow eighteen months or two years, and live thirteen or fourteen years. The senses of the fox are as good as those of the wolf; the organs of his voice are more pliant and perfect. The wolf sends forth only frightful howlings; but the fox barks, yelps, and utters a mournful cry like that of the peacock. He varies his tones according to the different sentiments with which he is affected: he has an accent peculiar to the chase, and tones of desire, of complaint, and of sorrow. He has another cry expressive of acute pain, which he utters only when he is shot, or has some of his members broken; for he never mourns over any other wound; and, like the wolf, may be beat till he is killed with a bludgeon without complaining: but he always defends himself to the last with great courage and bravery. His bite is obstinate and dangerous; and the severest blows will hardly make him quit his hold. In winter, particularly during frost, he yelps perpetually; but, in summer, he is almost entirely silent, and, during this season, casts his hair. He sleeps sound, in a round form, and may be easily approached without wakening; but, when he only reposes himself, he extends his hind legs, and lies on his belly. It is in this situation that he spies the birds along the hedges, and meditates schemes for their surprise. The fox flies when he hears the explosion of a gun, or smells gunpowder. He is exceedingly fond of grapes, and does much mischief in vineyards. Various methods are daily employed to destroy foxes: they are hunted with dogs; iron traps are frequently set at their holes; which are sometimes smoked to make them run out, that they may fall into the snares, or be killed by dogs or fire-arms. The chase of the fox requires less apparatus, and is more amusing than that of the wolf. To the latter every dog has great reluctance; but all dogs hunt the fox spontaneously and with pleasure; for, though his odor be strong, they often prefer him to the stag or the hare.

Of all animals the fox has the most significant eye, by which it expresses every passion of love, fear, hatred, &c. He is remarkably playful; but, like all savage creatures, half reclaimed, will on the least offence bite those he is most familiar with. He is a great admirer of his bushy tail, with which he frequently amuses and exercises himself, by running in circles to catch it: and in cold weather, wraps it round his nose. The smell of this animal is in general very strong, and that of his urine remarkably fetid. It is so obnoxious, that it has often proved the means of his escape from the dogs. In warm weather it will quit its habitation for the sake of basking in the sun, or to enjoy the free air; but then it rarely lies exposed, but chooses some thick brake, that it may rest secure from surprise. Crows, magpies, and other birds who consider the fox as their common enemy, will often, by their notes of anger point out its retreat. The skin of this animal is furnished with a warm soft fur, which in many parts of Europe is used to make muffs, and to line clothes. Vast numbers are taken in the Valais, and the Alpine parts of Switzerland. At Lausanne there are furriers who are often in possession of between 2000 and 3000 skins, all taken in one winter. There are several varieties of the fox, differing either in color or form, viz.: 2—4. C. vulpes alopex, the brant fox, or field fox of Linnæus, considered by him as a distinct species, has a straight tail, with a black tip, and a blackish fur, thicker than that of the common kind. Mr. Kerr says, it 'inhabits Europe, Asia, and Chili, and is less frequent, smaller, and of a darker color than the common fox, to which it is very similar in all other respects. That described by Mr. Pennant came from Pennsylvania. Authors do not seem properly agreed about the animal to which this name is given: at least the coal fox, of Buffon, and the brant fox, of Pennant, are considerably different, though quoted by Gmelin as synonymous.' They are therefore added as sub-varieties. *a.* C. vulpes alopex Americanus, the brant fox, as described by Gesner and Linnæus, is of a fiery redness; and called by the first brand-fuchs, by the last brandraef; it is scarcely half the size of the common fox: the nose is black, and much sharper; the space round the ears ferruginous; the forehead, back, shoulders, thighs, and sides, black, mixed with red, ash-color, and black; the belly yellowish; the tail black above, red beneath, and cinereous on its side. It is a native of Pennsylvania. *b.* C. vulpes alopex Europæus, the charbonnier, or coal fox of Buffon, has remarkably black feet and legs, and inhabits that part of France formerly called Burgundy. It is of a silvery gray color, and has the tail tipt with white. C. lycaon, the black fox, is the most cunning of the genus, and its skin the most valuable; a lining of it is, in Russia, esteemed preferable to the finest sables: a single skin will sell for 400 rubles. It inhabits the northern parts of Europe, Asia, and North America.

CANIS MAJOR, the great dog, in astronomy, a constellation of the southern hemisphere, below Orion's feet, somewhat to the westward. See ASTRONOMY.

CANIS MINOR, the little dog, in astronomy, a constellation of the northern hemisphere; called also by the Greeks Procyon, and by the Latins Antecanis and Canicula. See ASTRONOMY.

CANISIUS (Henry), a native of Nimeguen, whose real name was De Hondt, one of the most learned men of his time, was professor of canon law at Ingolstadt. His principal works are, 1. Summa Juris Canonici. 2. Antiquæ Lexicones, 7 vols. 4to, a very valuable work. He died in 1609.

CAN'ISTER, *n. s.* Lat. *canistrum.* A small basket. A small vessel in which any thing, such as tea or coffee, is laid up.

White lilies in full *canisters* they bring,
With all the glories of the purple spring. *Dryden.*

CAN'KER, *v. a.* & *n.* } Lat. *cancer.* It
CAN'KERBIT, *part. adj.* } seems to have the same meaning and original with cancer, but to be accidentally written with a *k*, when it denotes bad qualities in a less degree; or canker might come from, Fr. *chancre*, Ital. *canchero*, and cancer from the Latin. A worm that preys upon and destroys fruits. A fly that commits the same species of depredation. Any thing that corrupts or consumes. An eating or corroding humor. Corrosion: virulence. A kind of wild worthless rose; the dog rose. To grow corrupt: implying something venomous and malignant. To corrupt; to corrode. To infect; to pollute.

His chamber all was hanged about with rolls
And old records from ancient times derived
Some made in books, some in long parchment scrolls,
That were all worm-eaten and full of *canker* holes.
Spenser.

And loathfull idlenes he doth detest,
The *canker*-worme of everie gentle brest;
The which to banish with faire exercise
Of knightly feates, he daylie doth devise.
Spenser. Mother Hubberd's Tale.

I am not glad, that such a sore of time
Should seek a plaister by a contemn'd revolt,
And heal the inveterate *canker* of one wound
By making many. *Shakspeare.*

As with age his body uglier grows,
So his mind with *cankers.* *Id.*

Yet writers say, as in the sweetest bud
The eating *canker* dwells, so eating love
Inhabits in the finest wits of all. *Id.*
Know, my name is lost,
By treason's tooth baregnawn and *cankerbit.* *Id.*

Or if these *cankered* foes, as most men say,
So mighty be, that gird this wall of clay,
What makes it hold so long, and threatened ruin stay.
Fletcher's Purple Island.

Restore to God his due in tithe and time:
A tithe purloined *cankers* the whole estate. *Herbert.*

It is the *canker* and ruin of many mens' estates, which, in process of time, breeds a public poverty.
Bacon.

There be of flies, caterpillers, *canker* flies, and bear flies. *Walton's Angler.*

As the Jessean hero did appease
Saul's stormy rage and stopped his black disease,

So the learn'd bard with artful song suppressed
The swelling passion of his *canker'd* breast;
And in his heart kind influences shed
Of country's love, by truth and justice bred. *Marvell.*

Draw a cherry with the leaf, the shaft of a steeple, single or *canker* rose. *Peacham.*

A huffing, shining, flattering, cringing coward,
A *canker* worm of peace, was raised above him.
Otway.

To some new clime, or to thy native sky,
Oh friendless and forsaken virtue! fly:
The Indian air is deadly to thee grown;
Deceit and *cankered* malice rule thy throne. *Dryden.*

That eating *canker*, grief, and wasteful spite,
Preys on the rosy bloom of youth and beauty. *Rowe.*

An honest man will enjoy himself better in a moderate fortune, that is gained with honour and reputation, than in an overgrown estate, that is *cankered* with the acquisitions of rapine and exaction. *Addison.*

No longer live the *cankers* of my court;
All to your several states with speed resort;
Waste in wild riot what your land allows,
There ply the early feast and late carouse. *Pope.*

Thus, when a villain crams his chest,
Gold is the *canker* of the breast:
'Tis avarice, insolence, and pride,
And every shocking vice beside. *Gay.*

Beyond the lowly vale of shepherd's life
They never roam'd: secure beneath the storm
Which in ambition's lofty land is rife;
Where peace and love are *canker'd* by the worm
Of pride, each bud of joy industrious to deform.
Beattie.

How hideous and forlorn! where ruthless Care,
With *cankering* tooth corrodes the seeds of life;
And deaf with passions' storms when pines Despair,
And howling furies rouse the eternal strife. *Id.*

Canker, in farriery, a disease incident to horses, consisting of a kind of fungous excrescence in their feet, which sometimes destroys the whole hoof, and so the horse. See Farriery.

Canker, in gardening, a disease incident to trees, proceeding chiefly from the nature of the soil, which makes the bark rot and fall. If the canker be in a bough, cut it off; in a large bough, at some distance from the stem; in a small one, close to it; but, for over-hot strong ground, the ground is to be cooled about the roots with pond mud and cow dung.

CANNA, in botany, Indian flowering reed; a genus of the monogynia order, and monandria class of plants, natural order eighth, scitamineæ: cal. triphyllous: cor. erect, divided into six parts, with a distinct lip, bipartite and rolled back; the style lanceolate, and growing to the corolla: caps. crowned with the calyx. There are five species, viz. 1. C. coccinea, hath larger leaves than any of the other four species, and the stalks rise much higher. The flowers are produced in large spikes; and are of a bright crimson, or rather scarlet color. 2. C. glauca, with a very large yellow flower, is a native of South America. 3. C. Indica, or common broad-leaved flowering cane, is a native of both Indies; the inhabitants of the British islands in America call it Indian shot, from the roundness and hardness of the seeds. It has a thick fleshy tuberous root; which divides into many irregular knobs; it sends out many large oval leaves, without order. 4. C. angustifolia, a plant common to the tropical parts of America. 5. C. juncea, a Chinese plant, with a small rufous flower and grassy leaves.

Canna likewise denotes a sort of long measure, otherwise called by modern authors a cane, by the Latins calamus, and in scripture a reed.

CAN'NABINE, *adj.* Lat. *cannobinus.* Hempen.

CANNABIS, in botany, hemp; a genus of the pentandria order, and diœcia class, natural order fifty-third, scabridæ: cal. of the male quinquepartite, of the female monophyllous, entire, and gaping at the side: cor. none, styles two: the fruit is a nut, bivalved, within the closed calyx. Of this there is but one species, viz. C. sativa. It is propagated in the rich fenny parts of Lincolnshire in great quantities, for its bark, which is useful for cordage, cloth, &c. and the seeds abound with oil. Hemp is always sown on a deep, moist, rich, soil such as is found in Holland, Lincolnshire, and the fens of the island of Ely, where it is cultivated to great advantage; as it might be in many other parts of England, where there is a soil of the same kind; but it will not thrive on clayey or stiff cold land. The ground on which hemp is to be sown, should be well ploughed, and made very fine by harrowing. When the plants are come up, they should be hoed out as turnips are, leaving them two feet apart; observe also to cut down all weeds, which, if well performed in dry weather, will destroy them. This crop, however, will require a second hoeing, in about six weeks after the first; and, if this is well performed, the crop will require no further care. The first season for pulling hemp is usually about the middle of August, when they begin to pull what they call the simble hemp, being that which is composed of the male plants; but it would be much better to defer this for a fortnight or three weeks longer, until those male plants have fully shed their farina or dust, without which the seeds will prove only empty husks. These decay soon after they have shed their farina. The second pulling is a little after Michaelmas, when the seeds are ripe. This is usually called karle hemp, and consists of the female plants which were left. This karle hemp is bound in bundles of a yard compass, statute measure, which are laid in the sun for a few days to dry; and then it is stacked up, or housed, to keep it dry till the seed can be threshed out. An acre of hemp, on a rich soil, will produce nearly three quarters of seed, which, together with the unwrought hemp, is worth £6 to £8. Hemp is esteemed very effectual for destroying weeds; but this it accomplishes by impoverishing the ground, and thus robbing them of their nourishment; so that a crop of it must not be repeated on the same spot. Some seeds of a large kind of hemp, growing in China, were some years ago sent by the East India Company to the Society for the encouragement of Arts, Manufactures, and Commerce. From the leaves of hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor, of which they are very fond. The plant when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the tough rind for mechanic uses, is said to be violently poisonous, and to produce its effects almost as soon as drank. The seeds also have some smell of the herb, and their taste is unctuous and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like.

CANNÆ, in ancient geography, a town of Apulia, in the Adriatic, at the mouth of the river Aufidus, rendered famous by a terrible overthrow which the Romans received from the Carthaginians under Hannibal. The Roman consuls, Æmilius Paulus and Terentius Varro, being authorised by the Senate to quit the defensive plan, and take the chance of a battle, marched from Canusium, and encamped a few miles east, in two unequal divisions, with the Aufidus between them. In this position they meant to wait for an opportunity of engaging to advantage; but Hannibal, whose critical situation, in a desolate country without refuge or allies, could admit of no delay, found means to inflame the vanity of Varro by some trivial advantages in skirmishes between the light horse. Varro, elated with this success, determined to bring matters to a speedy conclusion. The Romans were more numerous than the Carthaginians; but the latter were superior in cavalry. The army of the former consisted of 87,000 men; that of the latter of 40,000 foot and 1000 horse. Without entering into the particulars of the battle, which is fully narrated by the Roman historians, it is sufficient to say that the most moderate computation makes the number of Romans killed to amount to 45,000, among whom were Æmilius Paulus the consul, and the pro-consuls Servilius and Attilius. The scene of action is marked by the name of Pezzo di Sangue, the Field of Blood. In 1201 the archbishop of Palermo and his rebellious associates, who had taken advantage of the nonage of Frederick of Suabia, were cut to pieces at Cannæ by Walter de Brienne, sent by the pope to defend the young king's dominions. The traces of this town are very faint, consisting of fragments of altars, cornices, gates, walls, vaults, and underground granaries. It was destroyed the year before the battle; but, being rebuilt, became an episcopal see in the infancy of Christianity. It was again ruined in the sixth century, but seems to have subsisted many ages later; for we read of its contending with Barletta for the territory, which till then had been enjoyed in common by them; and in 1284 Charles I. issued an edict for dividing the lands, to prevent future litigation. The prosperity of the towns along the coast, which increased in wealth and population by embarkations for the crusades and by traffic, proved the annihilation of the great inland cities; and Cannæ was probably abandoned entirely before the end of the thirteenth century.

CANNAY, one of the Western Isles of Scotland, south-west of Sky. It is fertile and verdant, and has vast ranges of basaltic pillars, rising above each other, from the sea, somewhat resembling the Giant's Causeway in Ireland. See BASALTES.

CANNEL COAL. See AMPELITES and COAL.

CANNEQUINS, in commerce, white cotton cloths brought from the East Indies. They are much used in trading on the coast of Guinea, particularly about the rivers Senegal and Gambia. They are folded square, and are about eight ells long.

CANNES, a town of France, in the department of the Var, and ci-devant province of Provence, on the coast of the Mediterranean, with a barbour and a castle. There is an excellent fishery for pilchards, and good fruit is grown in the environs. Napoleon Buonaparte landed here on his return from Elba, 1st March, 1815.

The practice of man-eating.

CANNIBALS. See ANTHROPOPHAGI.

CANNING (George), was born in London, April 11, 1770. His father, a man of considerable abilities and literary cultivation, had offended his family by marrying a lady without fortune, and died in 1771, leaving his widow destitute. She had recourse to the stage for support, but was not very successful, and was afterwards twice married. She lived to see the success of her son, from whom she ever received the tenderest marks of filial love. Mr. Canning inherited a small estate in Ireland, was educated at Eton, where he was distinguished for industry, vigour of mind, and elegance of taste, and, at the age of fifteen, formed the plan of a periodical called the *Microcosm*, of which he was the editor. In 1787 he was entered at Oxford. His vacations were passed with Sheridan, by whom he was introduced to Burke, Fox, and other distinguished whigs. Although Sheridan announced him as the future ornament of his party, yet he was brought into parliament in 1793 by Mr. Pitt. During the first session he remained silent. His maiden effort was made in 1794, on the Sardinian treaty, and rather disappointed expectation. In 1796, he was under-secretary of state. In 1797, he projected, with some of his friends, the Anti-Jacobin, or Weekly Examiner, of which Gifford was appointed editor, and to which he contributed. In 1798, he supported Wilberforce's motion for the abolition of the slave-trade. In July, 1800, he married Joanna, daughter of general Scott, a lady with a fortune of £100,000. The administration being dissolved in 1801, he became a member of the opposition, until the restoration of Pitt in 1804. In 1807, he was appointed secretary of state for foreign affairs in the Portland administration. A political misunderstanding with lord Castlereagh led to a duel between him and that minister, in which he was slightly wounded. This dispute occasioned the dissolution of the ministry. He invariably supported the admission of the Catholics into power, purely as a matter of expediency. To Mr. Canning was principally owing the first blow which shook the throne of Napoleon; the British policy in Spain was directed and animated by him. "If there was any part of his political life," he declared, "in which he gloried, it was that, in the face of every difficulty, discouragement, and prophecy of failure, his had been the hand which had committed England to an alliance with Spain." In 1812 he was elected member of Parliament for Liverpool; from

NIBALS. See ANTHROPOPHAGI.
NNING (George), was born in London,
11, 1770. His father, a man of consider-
abilities and literary cultivation, had of-
d his family by marrying a lady without
e, and died in 1771, leaving his widow
ute. She had recourse to the stage for
rt, but was not very successful, and was
vards twice married. She lived to see the
ss of her son, from whom she ever received
nderest marks of filial love. Mr. Canning
ited a small estate in Ireland, was educated
on, where he was distinguished for industry,
r of mind, and elegance of taste, and, at the
of fifteen, formed the plan of a periodical
d the *Microcosm*, of which he was the
r. In 1787 he was entered at Oxford. His
ions were passed with Sheridan, by whom he
introduced to Burke, Fox, and other distin-
ıed whigs. Although Sheridan announced
as the future ornament of his party, yet he
brought into parliament in 1793 by Mr.
During the first session he remained
t. His maiden effort was made in 1794, on
Sardinian treaty, and rather disappointed
ctation. In 1796, he was under-secretary of
In 1797, he projected, with some of his
ds, the Anti-Jacobin, or Weekly Examiner,
hich Gifford was appointed editor, and to
h he contributed. In 1798, he supported
berforce's motion for the abolition of the
e-trade. In July, 1800, he married Joanna,
ghter of general Scott, a lady with a fortune
£100,000. The administration being dis-
ed in 1801, he became a member of the op-
tion, until the restoration of Pitt in 1804. In
7, he was appointed secretary of state for
ign affairs in the Portland administration. A
tical misunderstanding with lord Castlereagh
to a duel between him and that minister, in
ch he was slightly wounded. This dispute
sioned the dissolution of the ministry. He
riably supported the admission of the Catho-
into power, purely as a matter of expediency.
Mr. Canning was principally owing the first
which shook the throne of Napoleon; the
ish policy in Spain was directed and ani-
ed by him. "If there was any part of his
tical life," he declared, "in which he gloried,
as that, in the face of every difficulty, discou-
ement, and prophecy of failure, his had been
hand which had committed England to an
ance with Spain." In 1812 he was elected
nber of Parliament for Liverpool; from

---

which he was also returned in 1814, 1818, 1820. In 1814, he was appointed minister to Portugal, and remained absent about two years. In 1819, he declared his hostility to parliamentary reform in any shape; and his speech on lord John Russell's motion for reform, in 1822, is among the most finished specimens of his eloquence. On the impeachment of the queen, he declared, that "towards the object of that investigation, he felt an unaltered regard and affection;" and soon after resigned the presidency of the board of control, and went abroad. Having been nominated governor-general of India, he was on the point of embarking, when the death of the marquis of Londonderry called him to the cabinet as secretary for foreign affairs (Sept. 16, 1822). One of his earliest acts, in this situation, was to check the French influence in Spain. In 1825, he communicated to foreign ministers the determination of his majesty to appoint *chargés d'affaires* to Colombia, Mexico, and Buenos Ayres. In answer to the charge of having encouraged the attack upon Portugal, by having permitted the occupation of Spain by France, he uttered the memorable words: "Was it necessary that we should blockade Cadiz? No. I looked another way; I resolved that if France had Spain, it should not be Spain with the Indies. I called the new world into existence, to redress the balance of the old." April 12, 1827, his appointment to be prime minister was announced. His administration was terminated by his death, the 8th of August following; but not until it had been crowned by the treaty of London (July 6), for the settlement of the affairs of Greece.—As a statesman, he was liberal, profound, consistent, and independent. His eloquence was persuasive and impassioned; his reasoning clear and logical; his manner graceful; his expression winning; and his whole appearance prepossessing. His wit was brilliant, and his satire was extremely caustic. He died poor. His remains were deposited in Westminster Abbey.

CAN'NIPPERS, *n. s.* corrupted from CALLIPERS; which see.

CAN'NON, *n.*
CAN'NONADE, *v.*
CAN'NON-BALL, *n.*
CAN'NON-BULLET, *n.*
CAN'NON-SHOT, *n.*
CAN'NONIER.
} Ital. *cannone*; Fr. *cannon*, from *cane*, a pipe, meaning a large tube. A great gun for battery. A gun larger than can be managed by the hand. They are of so many sizes that they decrease in the bore from a ball of forty-eight pounds to a ball of five ounces. To cannonade: to play the great guns; to batter or attack with great guns. A cannonier is the engineer that manages the cannon.

CANNON. These destructive missile engines have long been of considerable importance in military tactics. Their invention must obviously have been subsequent to the discovery of gunpowder. Mezeray states that King Edward struck terror into the French army, by five or six pieces of cannon; it being the first time they had encountered such thundering machines. In the list of aids raised for the redemption of king John of France, in 1368, mention is made of an officer in the French army, called the master of the king's cannon, and of his providing four large cannon for the garrison of Harfleur. But father Daniel, in his life of Philip of Valois, produces a proof from the records of the chamber of accounts at Paris, that cannon and gunpowder were used in the year 1338. The Germans carry the invention of cannon farther back, and ascribe it to Albertus Magnus, a Dominican monk, about the year 1250. But Isaac Vossius assures us that they were known in China upwards of 1900 years ago; being employed by the Emperor Kitey, in the year of Christ 85.

Cannon were originally made of bars of iron fitted together lengthways, or of sheets of iron rolled up and fastened together, and hooped with iron rings, and sometimes of wood. They were ponderous, clumsy, cumbrous, in a great measure unmanageable, and could not be transported from one place to another, but with great difficulty and labor. They were chiefly employed for throwing large stones like the machines of the ancients, which they succeeded. These were gradually supplanted by brass cannon, which had much smaller calibers, and threw iron bullets instead of stones, but produced in a few hours greater effects than the others could in many days. These guns were first cast of a mixture of copper and tin, called gun-metal from that circumstance, which continued to be employed for the same purpose for a long time before cast iron was made use of. As the use of artillery, however, became more general, and the number of cannon greatly increased, iron guns were invented by way of lessening the expense. An idea, however, that prevailed of their being very liable to burst when much heated by firing, retarded the general introduction of them into military service, and was the cause of their being made much heavier than brass guns of the same caliber. And this apprehension was strengthened by some accidents that took place, either through improper management, or the carelessness and unskilfulness of the early founders; this has militated against the general use of them even down to the present time. When cast, however, with iron obtained from good ore, they resist bursting as much as brass cannon, and possess great advantages over them.

At present, cannon take their names from the weights of the balls, which they respectively discharge. Thus a piece that discharges a ball of twenty-four pounds, is called a twenty-four pounder; one that takes a ball of twelve pounds is called a twelve pounder; and so of the rest, divided into the following sorts.

Ship-guns, consisting of forty-two, thirty-six, twenty-four, eighteen, twelve, nine, six and three pounders.

Garrison guns, consisting of forty-two, thirty-two, twenty-four, eighteen, twelve, nine and six pounders.

Battering guns, consisting of twenty-four, eighteen, and twelve pounders, and sometimes, though but seldom, of forty-two pounders.

Field pieces, consisting of twelve, nine, six, three, two, one and a half, one, and half-pounders.

The different parts of a gun will be best understood by a reference to plate II. MISCELLANY, fig. 6, in which *a b* is the length of the gun; *a e* the first reinforce; *e f* the second reinforce; *f b* the chase; *h b* the muzzle; *a h* the cascable; *a c* the breech; *c d* the vent field; *f i* the chace girdle; *r s* the base ring and ogee; *t* the vent astragal and fillets; *p q* the first reinforce ring and ogee; *v w* the second reinforce ring and ogee; *x* the chace astragal and fillets; *z* the muzzle astragal and fillets; *n* the muzzle mouldings; *m* the swelling of the muzzle; *a i* the breech mouldings.

The vacant cylinder, wherein the powder and ball are lodged, is called the bore, and the entrance of the bore the mouth of the gun. The cylindric parts *t*, by which the gun is fixed upon its carriage, are called trunnions; and the handles on brass pieces are called dolphins, from the fish whose form they represent. The diameter of the bore is called the caliber of the piece. Lastly, the difference between the diameters of the shot and the bore, is called the windage of the gun.

The mode of casting cannon is too important to be passed unnoticed in this article. This process was, until about half a century ago, considered an arduous undertaking; and so little were the fundamental principles of the art understood, that we are assured that not one in three of the shells cast for the mortar service could be admitted into the stores. Such have been the improvements made, that thousands of articles which used to be from necessity made of wrought iron, are now to be had from the foundries at less than one-fifth of their former prices; while the material itself has been so highly perfected, that instances have been known of cast-iron being sufficiently soft to bear the file, and sufficiently ductile to undergo the hammer. Such, indeed, could not be done but at a considerable expense; nor does it appear that much good could result in general. With respect to military apparatus, it is found expedient to have the whole of our cannon, mortars, carronades, shot, shells, and garrison gun-carriages, cast at the several foundries established in the vicinity of coal and iron mines, whereby the work is done at a comparatively low expense, and the articles can be conveyed by water to the warren at Woolwich, much under the prices at which they could be cast at the place, to which both the iron and the coals must be transported.

Guns are usually cast from metal brought into the fluid state in a reverberatory furnace, and the moulds are formed of loam or dry sand. Guns cast in loam do not come from the mould with a surface so correctly resembling that of the model as those cast in dry sand, and in order to render the surface correct, and to remedy defects, it was always necessary to subject them to the process of turning. In guns carefully cast in dry sand, the process of turning might be dispensed with, the gun would then be strengthened by the outer skin of metal, which, having cooled more rapidly than the other parts, is the hardest: this outer skin is also less liable to rust than the surface laid bare by turning. The mould of a gun in dry sand, at the same time that it is more accurate, is also sooner made and dried than a loam mould.

It may be proper to state that some experiments are at present being made at Douay, in cannon founding, under the direction of Messrs. Gay Lussac and D'Arcet, which tend to show that the addition of a small proportion of iron into the alloy of brass nearly doubles the force of resistance.

Brass guns are subject to melt at the interior extremity of the touch-hole, by the heat of quick firing; and the melted parts are driven out by the explosion, so as to render the touch-hole too wide. To prevent this, there is sometimes a bush of copper inserted, and in this bush the touch-hole is drilled. The copper, being less fusible than the brass, is not melted by the heat of firing the piece. To form the bush, a cylindrical piece of copper is hammered cold, and made into the form of a male screw. A hole is then bored, reaching from the surface of the gun into its bore; the diameter of this cylindrical hole is equal to the diameter of the cylinder of copper measured from the bottom of the threads of the screw. The piece of copper is then screwed into the cylindrical hole, and the touch-hole is drilled in it.

Cannon were formerly made of a very great length, which rendered them exceedingly heavy, and the use of them very limited and troublesome. There were some of them employed by the Turks, in 1394, at the siege of Constantinople, then in possession of the Christians, and also in 1452, which threw a weight of 100 lbs.; but they could not stand repeated firing. Louis XII. had one cast at Tours of the same size, that threw a ball from the bastile to Charenton. One of these extraordinary cannon was taken at the siege of Diu in 1546, by Don John de Castro, and is now in the castle of St. Julian de Barra, ten miles from Lisbon. The length of it is twenty feet seven inches; its diameter at the middle is six feet three inches; and it threw 100 lbs. weight. It has neither dolphins, rings, nor a button; is of an unusual kind of metal, and has an inscription on it, which says that it was cast in 1400. Formerly strange and uncommon names were given to cannon. Thus Louis XII., in 1503, had twelve brass cannon, cast of an extraordinary size, called after the twelve peers of France. The Spaniards and Portuguese named theirs after their saints. The emperor Charles V., when he went against Tunis, had twelve cannon founded, which he called the Twelve Apostles. At Milan there is a seventy-pounder called the Pimontelli; and there is one at Bois-le-duc called the Devil. At Dover castle there is a sixty-pounder called Queen Elizabeth's pocket-pistol. There is an eighty-pounder in the Tower of London, brought thither from Edinburgh castle, called Mountsmeg, and another in the royal arsenal at Berlin, called the Thunderer. The large guns employed by the French at the siege of Cadiz threw shells more than four miles.

A brief tabular view of the dimensions and weight of iron and brass guns may now be given.

Table of the Length, Weight, Caliber, and Charges, of British Government Iron Guns.

	Length.		Weight.			Diameter of the Bore.	Diameter of the Shot.	Diameter of the Shot Gauge.	Charge.

We have now to notice a new description of missile weapon, which may properly find a place in this article; we allude to the steam-cannon, suggested by Mr. Perkins. This ingenious American has proposed to employ the elastic force of water converted into steam for the purpose of propelling bullets; and the power of the apparatus must of necessity depend on the intensity of the heat which is employed. A small cannon has already been constructed, which, when connected with the generator or boiler, has been found to discharge ordinary musket-bullets at the rate of 240 in the minute, and with such tremendous force, that, after passing through an inch deal, the ball, in striking against an iron-target, became flattened on one side and squeezed out. The original size of the bullets was 0·65 of an inch; but, after striking the target, they were plano-convex, and their diameter 1·070 inches, and 0·29 of an inch thick.

CAN'NOT. A word compounded of can and not: noting inability.

Sir! seyd the burgeyse, no mevelle it is to me,
For many a time and oft, I *cannot* sey how lome,
He hath be in your marches; and as I trow in Room
Also he was ybore, yf I ne ly shall.
Chaucer's Canterbury Tales.

And you, most noble Lord: that can and dare
Redresse the wrong of miserable wight,
Cannot employ your most victorious speare
In better quarrell than defence of right,
And for a lady 'gainst a faithlesse knight. *Spenser.*

Thus though we *cannot* make our sun
Stand still, yet we will make him run. *Marvell.*

I *cannot* but believe many a child can tell twenty, long before he has any idea of infinity at all. *Locke.*

To cities and the court repair,
A fortune *cannot* fail thee there. *Gay.*

Base envy withers at another's joy,
And hates that excellence it *cannot* reach.
Thomson

There is a spur in its half movements, to become
All that the others *cannot*, in such things
As still are free to both, to compensate
For stepdame Nature's avarice at first. *Byron.*

CANNULA, or **CANULA,** in surgery, a tube They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance; or into wounds either accidental or artificial, of the large cavities, as the thorax or abdomen; they are used in the operation of bronchotomy; and, by some, after cutting for the stone, as a drain for urine. Other cannulæ are used for introducing cauteries, either actual or potential, in order to guard the parts adjacent from to be cauterised, from that injury. They are of various figures; oval, round, and crooked.

CANO (Alonzo), a statuary, who has been called the Michael Angelo of Spain, was born at Grenada, in 1600. He studied architecture and sculpture from his youth, first under his father, and then at Seville; his first instructions in painting were received from Juan dell Castillo. He was after this made royal architect, king's painter, and instructor to the prince, Don Balthazar Carlos. While enjoying the great celebrity which his talents and attainments deserved, he one evening found his house robbed, and his wife murdered in his absence; an Italian servant having fled. The magistrates, because Cano was of a jealous disposition, seemed now determined to sacrifice him, and he fled to Valencia, but afterwards returned to Madrid; where he endured torture, without criminating himself, and the king restored him to favor. He afterwards embraced an ecclesiastical life, as a protection from prosecution. When the priest, at the hour of his death, held to him a crucifix, he told him to take it away, for it was so badly done he could not bear the sight of such a performance. He died in 1676. See *Cumberland's Anecdotes of Eminent Spanish Painters.*

CANO'A, *n. s.*
CANOE'.
Sp. *canoa.* But the word is said to be originally West Indian; Columbus having found it in use at San Salvador, on his arrival there. A boat made by cutting the trunk of a tree into a hollow vessel.

Others made rafts of wood; others devised the boat of one tree, called the *canoa*, which the Gauls upon the Rhone used in assisting the transportation of Hannibal's army. *Raleigh.*

In a war against Semiramis, they had four thousand monoxyla, or *canoes* of one piece of timber. *Arbuthnot on Coins.*

CANOES are Indian boats, sometimes formed of several pieces of bark put together, but more frequently by the hollowing out the trunk of some tree. The largest are made of the cotton tree; some of them will carry between twenty and thirty hogsheads of sugar or molasses. Some are made to carry sail; and for this purpose are steeped in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other sorts very rarely carry sail, unless when going before the wind; their sails are made of short silk grass or rushes. They are commonly rowed with paddles, which are pieces of light wood somewhat resembling a corn-shovel; and, instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breadth, and seven or eight lengthwise. The American Indians, when they are under the necessity of landing to avoid a water-fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again. Some nations have vessels under this name, which differ from these, as the inhabitants of Greenland, &c. The Esquimaux canoe is, however, the only one essentially different; this is formed of ribs of whalebone, from end to end, sewed together with strong muscles, and covered with seal-skins. It is very small and light, and generally contains but one person, who, by fastening his large skin cloak to the sides of the canoe, renders the whole water-tight, so that if overset, he can recover himself with his paddle, without injury. The paddle is ten feet long, and flat at each end; and so expert are the natives in the use of it, that they can keep up with any English ten-oared boat.

Canon also denotes those books of Scripture, which are received as inspired and canonical, to distinguish them from either profane, apocryphal, or disputed books. Thus we say, that *Genesis* is part of the sacred *canon* of the Scripture. *Id.*

There are, in popish countries, women they call secular *canonesses*, living after the example of secular canons. *Id.*

These were looked on as lapsed persons, and great severities of penance were prescribed them by the *canons* of Ancyra. *Stillingfleet.*

It is very suspicious, that the interests of particular families, or churches, have too great a sway in *canonisations*. *Addison.*

John Fisher, bishop of Rochester, when the king would have translated him from that poor bishoprick, he refused, saying, he would not forsake his poor little old wife; thinking of the fifteenth canon of the Nicene council, and that of the *canonists*, *Matrimonium inter episcopum et ecclesiam esse contractum*, &c. *Camden's Remains.*

Of whose strange crimes no *canonist* can tell
In what commandment's large contents they dwell.
Pope.

Canons, in logick, are such as these: every part of a division, singly taken, must contain less than the whole; and a definition must be peculiar and proper to the thing defined. *Watts.*

He [Edward I.] seems to have been the first christian prince that passed a statute of mortmain; and prevented by law the clergy from making new acquisitions of lands, which, by the ecclesiastical *canons*, they were for ever prohibited from alienating.
Hume's History of England.

The *canon* law is a body of Roman ecclesiastical law, relative to such matters as that church either has, or pretends to have, the proper jurisdiction over.
Blackstone's Commentaries.

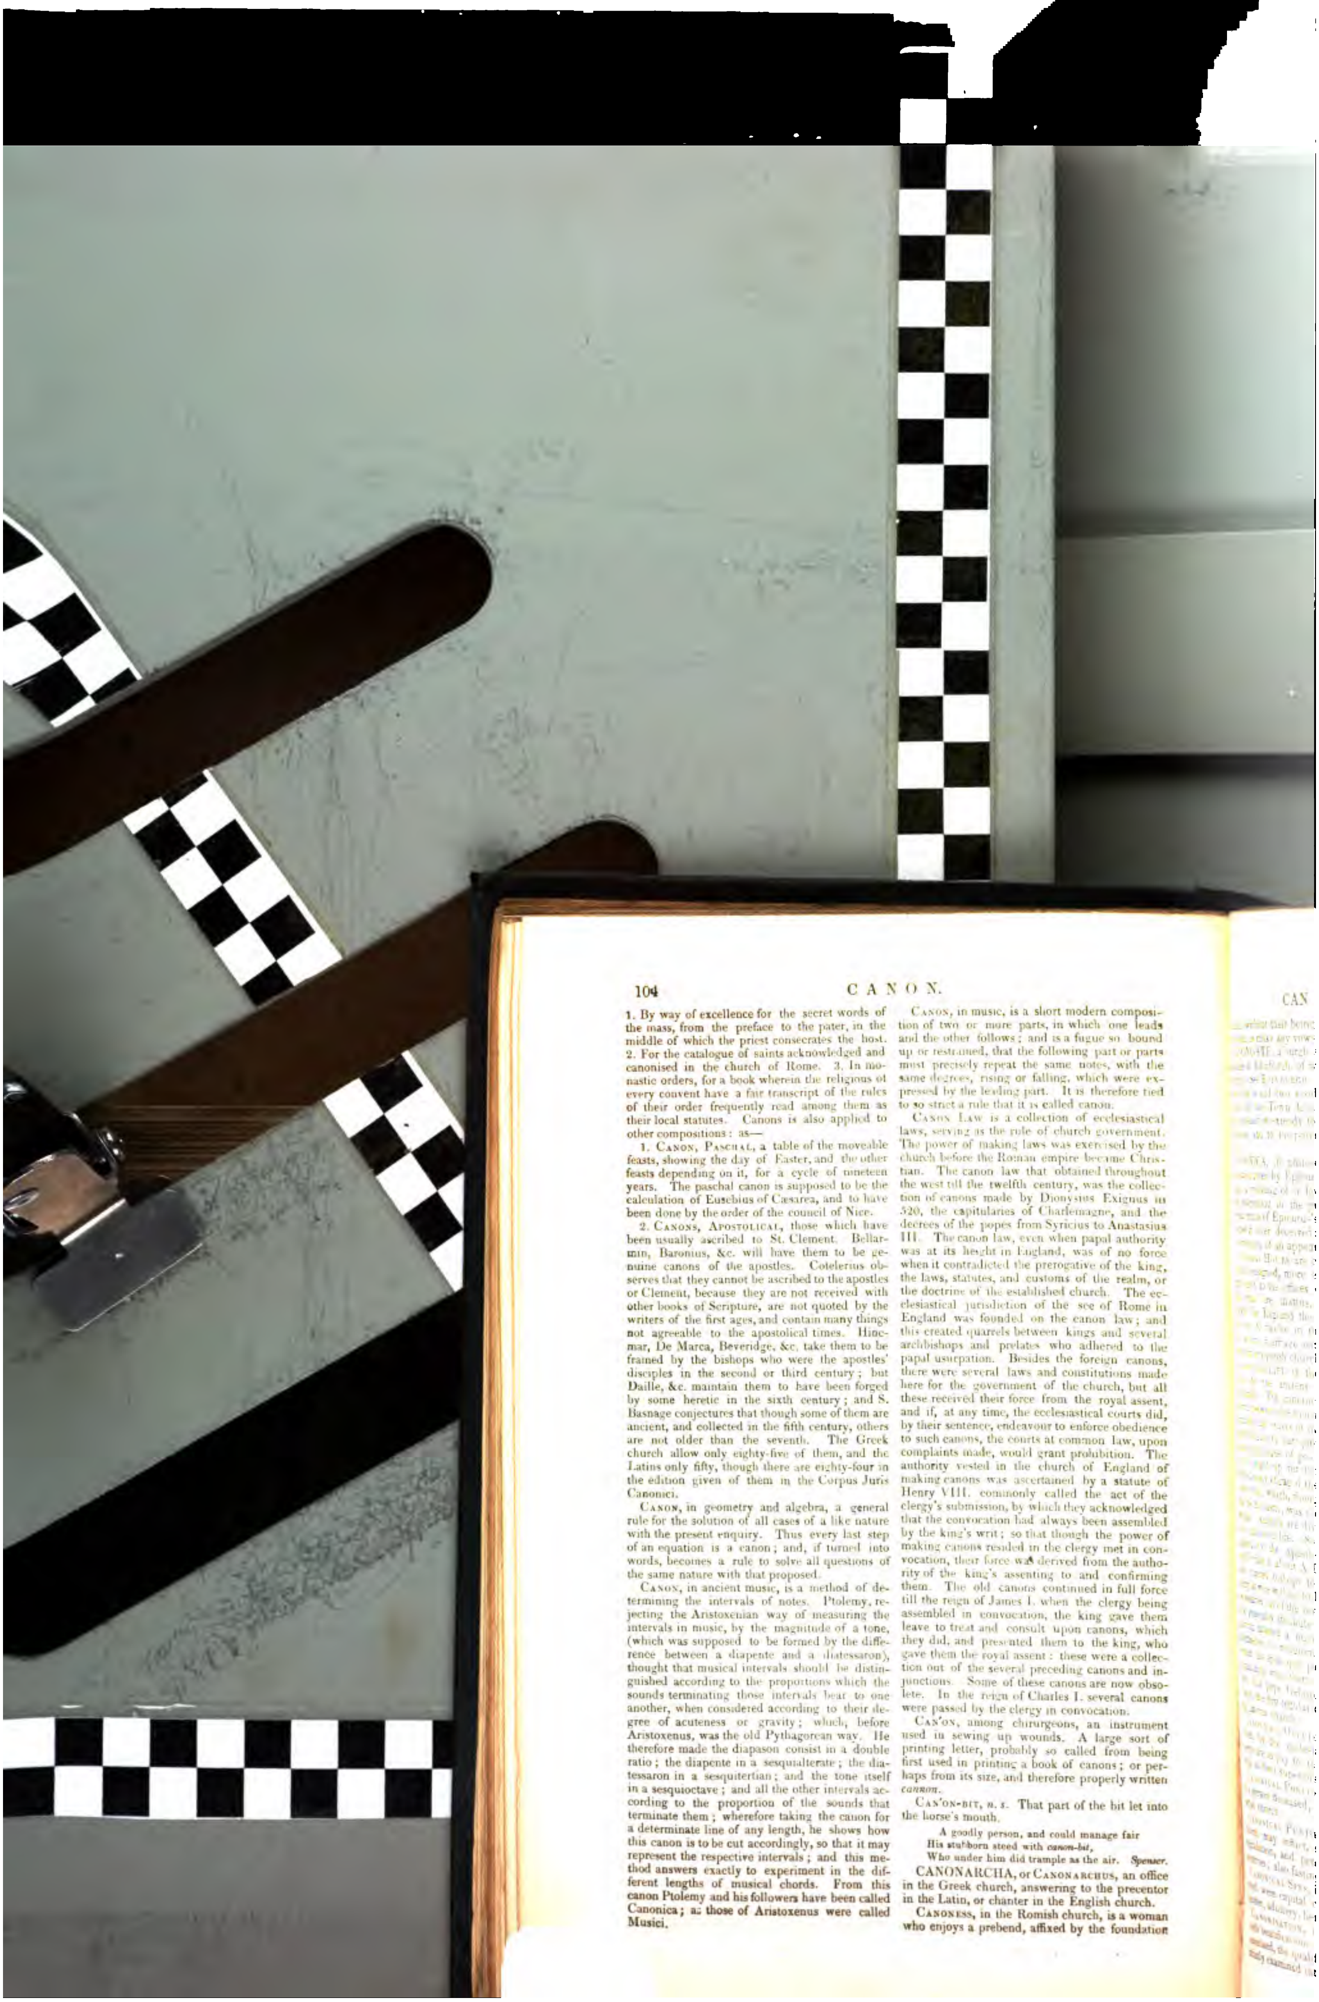
But a word or two;
His stature is twelve cubits: would you so far
Outstep these times, and be a Titan! or
(To talk *canonically*) wax a Son
Of Anak! *Byron.*

Canon, in an ecclesiastical sense, is a rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the sovereign. Canons are properly decisions of matters of religion, or regulations of the policy and discipline of a church, made by councils, either general, national, or provincial. Such are the canons of the council of Nice, or Trent, &c. There have been various collections of the canons of the Eastern councils; but four principal ones, each ampler than the preceding. The first, according to Usher, A. D. 380, contained only those of the first ecumenical council, and the first provincial ones: they were but 164 in number. To these, Dionysius Exiguus, in 520, added the fifty canons of the apostles, and those of the other general councils. The Greek canons in this second collection end with those of the council of Chalcedon; to which are subjoined those of the council of Sardica, and the African councils. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balsamon and Zonaras have commented.

Canon of Scripture. See Bible.

Canon, in a modern ecclesiastical sense, is a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral, or collegiate church. Canons are of no great antiquity; Pasquier observes that the name was not known before Charlemagne; at least the first we hear of are in Gregory de Tours, who mentions a college of canons instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I. The common opinion attributes the institution of this order to Chrodegangus bishop of Metz, about the middle of the eighth century. Originally canons were only priests, or inferior ecclesiastics, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will; supported by the revenues of the bishopric, and living in the same house, as his domestics or counsellors, &c. They even inherited his moveables, till A. D. 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule substituted in the place of that which had been appointed by Chrodegangus, and which was observed for the most part in the west till the twelfth century. By degrees these communities of priests, shaking off their dependence, formed separate bodies, whereof the bishops, however, were still the heads. In the tenth century there were communities of the same kind, established even in cities where there were no bishops; these were called collegiates, as they used the terms congregation and college indifferently; the name chapter now given to these bodies being much more modern. Under the second race of the French kings, the canonical life had spread all over the country; and each cathedral had its chapter distinct from the rest of the clergy. They had the name canon from the Greek **κανων**, which signifies three different things: a rule, a pension, or fixed revenue to live on, and a catalogue of matricula, all which are applicable to them. In time the canons freed themselves from their rules; and at length they ceased to live in community: yet they still formed bodies; pretending to other functions besides the celebration of the common office in the church, yet assuming the rights of the rest of the clergy, making themselves a necessary council of the bishop; taking upon them the administration of a see during a vacancy, and the election of a bishop to supply it. There are even some chapters exempt from the jurisdiction of the bishop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones also continued to form bodies, after they had abandoned living in community. Canons are of various kinds, particularly in the Romish church: as: 1. Canons, cardinal. 2. Canons, domicillary. 3. Canons expectative, &c. 4. Canons, lay or honorary, are such among the laity as have been admitted, out of honor and respect, into some chapter of canons. Dr. Johnson confounds these with the secular canons. 5. Canons, regular, are those who still live in community, and who have, to the practice of their rules, added the solemn profession of vows. They are called regulars, to distinguish them from those secular canons who abandon living in community, and observing the canons made for the maintenance of the ancient discipline.

Canon is also used in the Romish church:



1. By way of excellence for the secret words of the mass, from the preface to the pater, in the middle of which the priest consecrates the host. 2. For the catalogue of saints acknowledged and canonised in the church of Rome. 3. In monastic orders, for a book wherein the religious of every convent have a fair transcript of the rules of their order frequently read among them as their local statutes. Canons is also applied to other compositions: as—

1. Canon, Paschal, a table of the moveable feasts, showing the day of Easter, and the other feasts depending on it, for a cycle of nineteen years. The paschal canon is supposed to be the calculation of Eusebius of Cæsarea, and to have been done by the order of the council of Nice.

2. Canons, Apostolical, those which have been usually ascribed to St. Clement. Bellarmin, Baronius, &c. will have them to be genuine canons of the apostles. Cotelerius observes that they cannot be ascribed to the apostles or Clement, because they are not received with other books of Scripture, are not quoted by the writers of the first ages, and contain many things not agreeable to the apostolical times. Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles' disciples in the second or third century; but Daille, &c. maintain them to have been forged by some heretic in the sixth century; and S. Basnage conjectures that though some of them are ancient, and collected in the fifth century, others are not older than the seventh. The Greek church allow only eighty-five of them, and the Latins only fifty, though there are eighty-four in the edition given of them in the Corpus Juris Canonici.

Canon, in geometry and algebra, a general rule for the solution of all cases of a like nature with the present enquiry. Thus every last step of an equation is a canon; and, if turned into words, becomes a rule to solve all questions of the same nature with that proposed.

Canon, in ancient music, is a method of determining the intervals of notes. Ptolemy, rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone, (which was supposed to be formed by the difference between a diapente and a diatessaron), thought that musical intervals should be distinguished according to the proportions which the sounds terminating those intervals bear to one another, when considered according to their degree of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made the diapason consist in a double ratio; the diapente in a sesquialterate; the diatessaron in a sesquitertian; and the tone itself in a sesquioctave; and all the other intervals according to the proportion of the sounds that terminate them; wherefore taking the canon for a determinate line of any length, he shows how this canon is to be cut accordingly, so that it may represent the respective intervals; and this method answers exactly to experiment in the different lengths of musical chords. From this canon Ptolemy and his followers have been called Canonica; as those of Aristoxenus were called Musici.

Canon, in music, is a short modern composition of two or more parts, in which one leads and the other follows; and is a fugue so bound up or restrained, that the following part or parts must precisely repeat the same notes, with the same degrees, rising or falling, which were expressed by the leading part. It is therefore tied to so strict a rule that it is called canon.

Canon Law is a collection of ecclesiastical laws, serving as the rule of church government. The power of making laws was exercised by the church before the Roman empire became Christian. The canon law that obtained throughout the west till the twelfth century, was the collection of canons made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes from Syricius to Anastasius III. The canon law, even when papal authority was at its height in England, was of no force when it contradicted the prerogative of the king, the laws, statutes, and customs of the realm, or the doctrine of the established church. The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation. Besides the foreign canons, there were several laws and constitutions made here for the government of the church, but all these received their force from the royal assent, and if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons was ascertained by a statute of Henry VIII. commonly called the act of the clergy's submission, by which they acknowledged that the convocation had always been assembled by the king's writ; so that though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the king's assenting to and confirming them. The old canons continued in full force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons, which they did, and presented them to the king, who gave them the royal assent: these were a collection out of the several preceding canons and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

Can'on, among chirurgeons, an instrument used in sewing up wounds. A large sort of printing letter, probably so called from being first used in printing a book of canons; or perhaps from its size, and therefore properly written *cannon*.

Can'on-bit, *n. s.* That part of the bit let into the horse's mouth.

> A goodly person, and could manage fair
> His stubborn steed with *canon-bit*,
> Who under him did trample as the air. *Spenser.*

CANONARCHA, or Canonarchus, an office in the Greek church, answering to the precentor in the Latin, or chanter in the English church.

Canoness, in the Romish church, is a woman who enjoys a prebend, affixed by the foundation to maids, without their being obliged to renounce the world, or make any vows.

CANONGATE, a burgh adjacent and under vassalage to Edinburgh, of which it is one of the suburbs. See EDINBURGH. It is governed by a baron bailie and two resident magistrates, appointed by the Town Council of Edinburgh. Their jurisdiction extends to the east side of the Pleasance, and to the populous town of North Leith.

CANONICA, in philosophical history, an appellation given by Epicurus to his doctrine of logic, as consisting of a few rules for directing the understanding in the pursuit of truth. The great principle of Epicurus's canonica is, that the senses are never deceived; and therefore that every sensation of an appearance is true.

CANONICAL HOURS are certain stated times of the day, consigned, more especially by the Romish church, to the offices of prayer and devotion. Such are matins, lauds, sixth, ninth, vespers. In England the canonical hours are from eight to twelve in the forenoon, before or after which, marriage cannot be legally performed in any parish church.

CANONICAL LIFE is the rule of living prescribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were entirely distinct; but pious persons afterwards instituted colleges of priests and canons, where clerks brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was more restrained than the secular. Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles, others ascribe it to pope Urban I. about A.D. 1230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessaries out of the revenues of their churches. The generality attribute it to St. Augustin, who, having gathered a number of clerks to devote themselves to religion, instituted a monastery within his episcopal palace, where he lived in community with them. Onuphrius Panvinius says that pope Gelasius I. about A. D. 495, placed the first regular canons of St. Augustin in the Lateran church.

CANONICAL OBEDIENCE is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and the religious to their superiors.

CANONICAL PORTION, so much of the effects of a person deceased, as the canons allow to his parish church.

CANONICAL PUNISHMENTS are those which the church may inflict, such as excommunication, degradation, and penance, in Roman Catholic countries; also fasting, alms, whipping, &c.

CANONICAL SINS, in the ancient church, those which were capital or mortal, such as idolatry, murder, adultery, heresy, and schism.

CANONISATION, in the Romish church, succeeds beatification. Before a beatified person is canonised, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles: which done, the holy father decrees his canonisation, and appoints the day. On the day of canonisation the pope officiates in white, and the cardinals are dressed in the same color. St. Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonisation, are embroidered in gold and silver. The following rule is now observed, though it has not been in force above a century, viz. not to enter into the enquiries prior to canonisation till fifty years, at least, after the death of the person to be canonised. This rite of the modern Romans resembles the deification of the ancient Romans, and, in all probability, takes its rise from it.

CANOPUS, in astronomy, a star of the first magnitude in the rudder of Argo.

CANOPUS, in Pagan mythology, one of the deities of the ancient Egyptians, and the god of water. It is said, that the Chaldeans, who worshipped fire, carried their deity through other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver, and gold, its priests declared that all gods did it homage. This the priests of Canopus hearing, and finding that the Chaldeans had brought their gods to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopped with wax, and having filled the vessel with water, painted it of several colors, and fitting the head of their idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water gushed out through the holes and extinguished the fire; and thus Canopus conquered the god of the Chaldeans. Canopus, according to Strabo, was a native of Amycla, had been Menelaus's pilot, and had a temple erected to him in the town of Canopus. It is mentioned by Dionysius. Vossius remarks the vanity of the Greeks, who, as he conjectures, hearing of the Egyptian deity, took an opportunity of deifying the pilot of Menelaus, and giving out that the Egyptian god Canopus had been a Greek.

CANOPUS, in ancient geography, a city of Lower Egypt, on the Mediterranean, near one of the mouths of the Nile, 120 stadia or thirteen miles east of Alexandria: as old as the war of Troy, Canopus being there buried. See ABOUKIR.

CAN'OPY, *v. a.* & *n.* } The noun is from
CAN'OPIED. } κωνωπεῖον barbarous;

Lat. *canopium*; Fr. *canopée*; a covering of state over a throne, or bed; anything spread above the head. The Canopy of Heaven is the concave limit of our vision, beyond which the eye cannot penetrate: when studded with stars at night, it is like a dark mantle bespangled with gems, and is the canopy under which we walk, or repose.

She is there brought unto a paled green,
And placed under a stately *canopy*,
The warlike feats of both those knights to see.
Faerie Queene.

I have of late (but wherefore I know not) lost all my mirth—Indeed it goes so heavily with my disposition, that this goodly frame, the earth, seems to me a steril promontory; this most excellent *canopy*, the air, look you, this brave o'erhanging firmament, this majestic roof, fretted with golden fires, why it appears no other to me than a foul and pestilent congregation of vapours. *Shakspeare.*

I sat me down to watch upon a bank
With ivy *canopied*, and interwove
With flaunting honeysuckle, and began,
Wrapt in a pleasing fit of melancholy,
To meditate my rural minstrelsy,
Till fancy had her fill. *Milton's Comus.*

Now spread the night her spangled *canopy*,
And summoned every restless eye to sleep. *Fairfax.*

The birch, the myrtle, and the bay,
Like friends did all embrace;
And their large branches did display
To *canopy* the place. *Dryden.*

CANOPY formed from κωνωπεῖον, a mosquito net, of κώνωψ, a gnat. Canopies are also borne over the head in processions of state, after the manner of umbrellas. The canopy of an altar is called Ciborium. The Roman grandees had their canopies, or spread veils, called thensæ, over their chairs; and in temples over the statues of the gods. The modern cardinals still retain the use of canopies.

CANOROUS, *adj.* Lat. *canorus.* Musical; tuneful.

Birds that are most *canorous*, and whose notes we most commend, are of little throats, and short.
Browne's Vulgar Errours.

guage which may be distinguished by the name of *cant*. *Spectator.*

Of all the *cants* which are canted in this canting world, though the *cant* of hypocrites may be the worst, the *cant* of criticism is the most tormenting. *Sterne.*

I want a hero : an uncommon want,
When every year and month sends forth a new one;
Till, after cloying the gazettes with *cant*,
The age discovers he is not the true one.
Byron. Don Juan.

The primum mobile of England is *cant*. *Id.*

CANT, *s.* } CAN'TER, *s.* } A side, an edge; Goth. and Swed. *kant*; the gallop of an ambling horse, in which one side moves before the other; called ludicrously, says Thomson, a Canterbury gallop; because Kent and Canterbury are also from cant, a side. Johnson gives another reason. The hand gallop of an ambling horse, commonly called a canter; said to be derived from the monks riding to Canterbury on easy ambling horses.

CANT', *n.* } CAN'TLE, *n.* & *v.* } CANTI'LEVERS, } CAN'TICLE, } CANT'LET. } From *canto*, which signifies a piece, section, square, or angle. Fr. *chantel*, *chanteau*, a small piece, or fragment. To cantle, is to cut in pieces; to project in small angles. Cantilevers are small pieces of wood to support the eaves of a house. A cantle is a piece with corners. Cantlet is the diminutive; a small piece or fragment. Cant is supposed to mean a niche in the following passage of Ben Jonson:

The first and principal person in the temple was Irene, or Peace; she was placed aloft in a *cant*. *Ben Jonson.*

In this sense it is also used by Decker:

Directly under her, in a *cant* by herself, was Areta enthroned. *Decker.*

Canticle is a section, or a piece; but usually applied to a song; it is thus used in Scripture.

For nature hath not taken his beginning
Of no partie, ne *cantel*, of a thing,—
But of a thing that parfit is and stable.
Descending so till it be corrumpable.
Chaucer's Canterbury Tales.

See how this river comes me crankling in,
And cuts me from the best of all my land
A huge half-moon, a monstrous *cantle* out.
Shakspeare. Henry IV.

Nor shield nor armour can their force oppose;
Huge *cantlets* of his buckler strew the ground,
And no defence in his bored arms is found. *Dryden.*
For four times talking, if one piece thou take,
That must be *cantled*, and the judge go snack.
Dryden's Juvenal.

CANTABRIA, a district of Tarraconensis, on the Oceanus Cantabricus, now called Biscay. Dr. Wallis makes the Cantabrian the ancient language of all Spain; which, according to him, like the Gaulish, gave way to a kind of broken Latin, called romance or romanshe; which by degrees was refined into the Castilian, or present Spanish. The Cantabrians were famous anciently for their warlike character. In conjunction with the Asturians, they carried on a long war with the Romans; but were subdued by them about A. A. C. 25. Impatient, however, of a reign yoke, they soon revolted. Most of their youth had been taken prisoners by the Romans, and sold for slaves to the neighbouring nations; but, having found means to break their chains, they cut the throats of their masters; and, returning to their own country, attacked the Roman garrisons with incredible fury. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; knowing that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage. Animated with this reflection, they fell upon the Romans with a fury hardly to be imagined, routed them in several engagements, and defended themselves, when attacked, with such intrepidity, that Agrippa afterwards owned that he had never, either by sea or land, been engaged in a more dangerous enterprise. But, having at last prevailed upon his forces to try the chance of an engagement in the open field, he so animated them by his example, that after a most obstinate dispute, he gained a complete victory, which put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces; their castles and strong holds taken and rased; and their women, children and old men (none else being left alive) were obliged to abandon the mountainous places, and settle in the plain.

CANTABRICUS OCEANUS, the ancient name of the Bay of Biscay.

CANTABRUM, in antiquity, a large flag used by the Roman emperors, distinguished by its peculiar color, and bearing some motto of good omen, to encourage the soldiers.

CANTACUZENUS (Johannes), emperor of Constantinople, and an historian, was born in Constantinople, of a noble family. He was bred to letters and to arms, and admitted to the highest offices of the state. The emperor Andronicus loaded him with wealth and honors; made him generalissimo of his forces; and desired him to join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till John Paleologus, then only nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empress dowager and her faction forming a party against him, declared him a traitor. On this, the principal nobility and the army besought him to ascend the throne; and accordingly he was crowned, 21st May, 1342. This was followed by a civil war, which lasted five years: when he had John admitted a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicions and enmities, however, soon arising, the war broke out again, and Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire; and, retiring to a monastery, took the habit of a monk and the name of Joasaphas. In this retirement, he lived till 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek MS. was published by Pontanus at Ingolstadt, in 1603; and a splendid edition was prin-

l been taken prisoners by the Romans,

CANTA, a province and town of Peru, situated in the Cordillera, and supporting immense herds of cattle, sheep, and wild goats. The sheep is of the cama species. The town of Canta stands in lat. 11° 10′ south.

CANTAL, a chain of mountains in upper Auvergne, France, the highest peak in which (called the Plomb de Cantal) is said to be 5918 feet above the level of the sea. They give name to the following department, through the centre of which they run.

Cantal, an interior department in the south of France, part of the late province of Auvergne; it is now divided into four arrondissements, twenty-three cantons, and 272 communes; it is in the diocese of St. Flour, and royal jurisdiction of Riom, its area is 1,124,802 arpents. It is a hilly country producing some wine; and is a grazing rather than an arable district. It has manufactures of linen, leather, and paper; and contains some antimony and other minerals The river Dordogne rises in the north part of the department, and the Tuyere, a branch of the Lot in the south. Population in 1825, 552,100; Aurillac, the chief town, is 108 French leagues or 258 English miles due south of Paris. Mauriac, Murat, and St. Flour, are the chief towns of the other three arrondissements.

CANTARINI (Simon), a famous painter, ro, was the disciple of Guido; and copied the manner of his master so exactly, that it is often difficult to distinguish their works. He died at Verona in 1648.

Cantata, in music, is a composition, first used in Italy, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes for other instruments.

CANTATION, *n. s.* From Lat. *canto.* The act of singing.

CANTEENS, in military language, tin vessels in the form of square bottles, used for carrying water to supply the soldiers in camp. Also a machine made of wood or leather, with compartments for several utensils, generally used by officers.

CANTEMIR (Demetrius), the son of a prince of Moldavia. Disappointed by not succeeding his father in that dignity, held under the Ottoman Porte, he went over with his army to the czar Peter the great, against whom he had been sent by the grand seignior, and signalised himself in the czar's service. He is the author of a Latin history of the origin and decline of the Ottoman empire. He died at his estate in the Ukraine in 1729.

Cantemir (Antiochus), esteemed the founder of the Russian poetry, was the youngest son of Demetrius. Under the professors, whom the czar, Peter, had invited to Petersburgh, he learned mathematics, physic, history, moral philosophy, and polite literature; when he had finished his academic course he printed a Concordance to the Psalms, in the Russian language, and was elected member of the Academy. When but twenty-three years of age, he was nominated minister at the court of Great Britain; and his dexterity in the management of public affairs was as much admired as his taste for science. He had the same reputation in France, whither he went in 1738, in quality of minister plenipotentiary, and soon after was invested with the character of ambassador extraordinary. He died of a dropsy, at Paris, in 1744, aged forty-four years.

CANTERBURY, a city of England, capital of the county of Kent. It is seated on the banks of the river Stour, fifty-five miles east by south of London, on the great high road to Dover, from which it is distant seventeen miles. Canterbury is a place of great antiquity; by the ancient Britons it was dignified by the title of Caerkent, or the City of Kent; and its site was too favorable to escape the enlightened attention of the Romans, by whom it was called Durovernum. Ethelbert, the fifth king of Kent, who began his reign in 568, made it his residence; after the Norman conquest, William Rufus made Canterbury the chief archiepiscopal see of England, and conferred it wholly upon the bishops; but it owes its chief celebrity to the massacre of its bishop Thomas à Becket, on the 29th of December 1170. Some disputes having arisen between the bishop and the king, Henry II., four surveillants of the court, took upon themselves to avenge what they considered an affront offered to the king; for which purpose they proceeded secretly to Canterbury, and murdered the prelate by beating him with clubs, whilst engaged at vespers in the church of St. Benedict (now extinct). Becket was a very imperious man; but there does not appear to have been any thing in his conduct to justify so revengeful an act; and, to the credit of the king, he does not appear to have been a party to it. He dispatched a deputation to the pope to exonerate himself from having participated in so foul a deed, and the pope sent two legates to impose upon him a public penance, in expiation of the crime. The king accordingly proceeded to Canterbury, and when arrived within sight of the city he dismounted from his horse, and walked barefoot to the church, and prostrated himself for a whole day before the shrine of the murdered bishop, who had become canonised as a saint. On the following day he presented his back to the monks, and put scourges into their hands, with which they inflicted a punishment of eighty lashes, after which he received absolution. Henry has been accused of hypocrisy, in submitting to this ceremony. It possibly was so; but the page of history does not fully justify the conclusion. After this event, Canterbury became the grand resort of pilgrims from every part of England, as well as of numbers from various parts of Europe, who contributed to render the shrine of the martyr one of the richest in Christendom; it continued so until Henry VIII. seized all the offerings, which were exceedingly valuable, and appropriated them to his own use. It is still an archiepiscopal see, and its incumbent is primate of all England, taking precedence of all the nobility and great officers of state, not of the royal blood; at the coronation of the sovereigns of England, he places the crown on their head; the king and queen, wherever they may be residing, are regarded as his domestic parishioners; his provincial and sub-dean, chancellor, and chaplain, are all bishops. The cathedral is a noble structure; its building commenced in the reign of Henry II., four or five years after the murder of Becket, but was not finished till the reign of Henry V. It is 514 feet in length from west to east within the walls; the east transept is 154 feet, and the choir 180 feet, the height of the vaulted roof is eighty feet, and of the tower 235 feet; several kings, princes, cardinals, and bishops have been interred here. It formerly contained thirty-eight altars: the shrine of Becket was placed in a chapel dedicated to the Holy Trinity, behind the great altar. This noble edifice suffered greatly during the fanatical reign of Cromwell, who quartered his cavalry within its walls. It was, however, thoroughly repaired after the Restoration. In 1784 an elegant organ was introduced, and in 1788 the floor was new laid with stone; it has a most beautiful window of stained glass, and the whole is now in a fine state of preservation. In addition to the cathedral, to which are attached, beside the archbishop, dean, sub-dean, and chancellor, twelve prebends, six preachers, six minor canons, six substitutes, twelve lay clerks, ten choristers, two masters, fifty scholars, and twelve almsmen; there are fifteen other churches; and within the precincts of the cathedral is the archiepiscopal palace, and a grammar school founded by Henry VIII. Canterbury contains several other public buildings, both ancient and modern; among the former is the guildhall, Christ Church gate, &c.; and among the latter, are a theatre and public assembly rooms; a hill on the outskirts of the city being laid out with terraced walks, and tastefully planted, forming a delightful promenade. It had formerly a considerable manufacture of silk, which has materially declined of late years; and its chief trading importance now consists in its extensive thoroughfare; being the point of conveyance to London from Dover, Deal, Ramsgate, and Margate, the travelling intercourse is very great; it is also the chief place of fashionable resort in the county, and its annual races and periodical assemblies attract numerous visitors. The surrounding country is very fertile, producing great quantities of hops, wheat, and other grain, and its markets on Wednesdays and Saturdays are numerously attended. It has two springs of mineral water within the city, strongly impregnated with sulphur and steel. The corporation consists of a mayor, twelve aldermen, twenty-four common-council-men, four serjeants-at-mace, sheriff, coroner, &c. who hold a court in the guildhall to try civil and criminal cases every Monday, and on Tuesdays for city affairs. It returns two members to parliament. It somewhat declined in population during the twenty years' war, which commenced in 1793, owing to the non-intercourse between London and Paris, between which it is the great thoroughfare. The number of inhabitants in 1801 was 10,498; in 1811 only 10,200; but increased in 1821 to 12,745. It is six miles distant from the south bank of the Thames.

Canterbury, a town of the United States, in Connecticut, agreeably situated in Windham county on the west side of the river Quimaboug, over which there is a wooden bridge. It is nine miles east by south of Windham.

Canterbury Bells. See Campanula.

CANTERUS (William), an eminent linguist and philologer, was born at Utrecht, in 1542. He studied at Louvaine and Paris; and afterwards visited the universities of Germany and Italy. He died at Louvaine in 1575, aged thirty-three. He was master of six languages, besides that of his native country; and wrote several philological and critical works, among which are, Notæ, Scholia, Emendationes, et Explicationes, in Euripidem, Sophoclem, Æschylum, Ciceronem, Propertium, Ausonium, &c. and many translations of Greek authors.

CANTHAR'IDES, *n. s.* Lat. Spanish flies, used to raise blisters.

> The flies *cantharides*, are bred of a worm, or cater pillar, but peculiar to certain fruit trees; as are the fig-tree, the pine-tree, and the wild brier; all which bear sweet fruit, and fruit that hath a kind of secret biting or sharpness; for the fig hath a milk in it that is sweet and corrosive; the pine apple hath a kernel that is strong and abstersive. *Bacon's Natural Hist.*

Cantharides, in medicine and zoology, a kind of poisonous insects, much used as an epispastic. The stimulating power of cantharides is caused by a very acrid resinous substance, contained in these insects, two scruples of which Neumann extracted from four ounces of cantharides by spirit of wine. Cantharides are very sharp and corrosive, abounding with a subtile, caustic, volatile salt; whereby they become exceedingly injurious to the bladder, so as to ulcerate it, even when applied externally, if suffered to lie on too long. They are much commended in fevers, &c. See Medicine.

CANTHARIS, in zoology, a genus of insects of the order coleoptera. The feelers of this genus are setaceous; the breast is marginated, and shorter than the head; the elytra, or wing-cases, are flexile; and the sides of the belly are plated and papillous. This is an extremely rapacious tribe, preying even on its own species, except the lymexylon of Linnæus, which feed on wood. This numerous and extensive genus has been well divided by Gmelin into the three following sections: 1. Those having four feelers of a hatchet shape. 2. Having filiform feelers, with the last joint cetaceous. These are the malachii of Fabricius. 3. Fore-feelers projecting, the last joint but one with a large ovate, cleft appendage; the last joint ovate, acute. The lymexylon of Fabricius. The cantharis is found scattered in all parts of the world, especially in Europe.

CANTHIUM, in botany, a genus of plants of the tetrandria class and monogynia order: cal. four-toothed, superior: cor. one-petalled, with a short inflated tube, and four-parted border, the mouth downy; drupe two-celled, with a one-celled nut in each. Species only one; a Coromandel shrub, with small yellow flowers.

CANTO; Arab. *kata; κατον, καυτα, κουτο;* Lat. *cento;* Ital. *canto;* a section, a division, part, portion, piece. Thus a division or section of a poem, or a song.

> But evermore my shield did me defend
> Against the storme of every dreadfull stoure:
> Thus safely with my love I thence did wend.
> So ended he his tale, where I this *canto* end. *Spenser.*

> Why, what would you do?——
> —Make a willow cabbin at your gate,
> And call upon my soul within the house;
> Write loyal *cantos* of contemned love.
> *Shakspeare. Twelfth Night.*

> Then should thy shepherd (poorest shepherd) sing
> A thousand *cantos* in thy heavenly praise,
> And rouse his flagging muse, and fluttering wing,
> To chaunt thy wonders in immortal lays.
> *Fletcher's Purple Island.*

> But now the city and the train we leave,
> To seek the duke and make his fortune known;
> And how the rest the dreadful news receive,
> Shall be in the succeeding *cantos* shown. *Gay.*

CANTON, *v. a.* & *n.* } Fr. *canton;* Lat.
CAN'TONIZE, *v. a.* } *centena.* See CANTO.
CAN'TONMENT. } A small parcel or division of land. A small community, or clan. To divide into little parts. To parcel out into small divisions.

The same is the case of rovers by land; such as yet, are some *cantons* in Arabia, and some petty kings of the mountains adjacent to straits and ways. *Bacon's Holy War.*

Thus was all Ireland *cantonised* among ten persons of the English nation. *Davies on Ireland.*

The whole forest was in a manner *cantonised* amongst a very few in number, of whom some had regal rights. *Howel.*

Only that little *canton* of land, called the English pale, containing four small shires, did maintain a bordering war with the Irish, and retain the form of English government. *Davies.*

Families shall quit all subjection to him, and *canton* his empire into less governments for themselves. *Locke.*

It would certainly be for the good of mankind, to have all the mighty empires and monarchies of the world *cantoned* out into petty states and principalities. *Addison on Italy.*

They *canton* out to themselves a little province in the intellectual world, where they fancy the light shines, and all the rest is in darkness. *Watts on the Mind.*

CANTON, a city, sea-port, and capital of Quantong, the most southern province of China, and the only port in that vast empire with which Europeans are permitted to hold any intercourse. It is finely situated on the north bank of a noble river, which, by numerous collateral branches, intersects all the southern part of the empire; one branch is from the north, which, by a portage of only one day's journey, communicates with the great chain of inland waters extending to Pekin, and intersecting every intermediate province, thereby affording a facility of conveyance by water, which renders Canton peculiarly well adapted for the great outport of the empire. The harbour is very commodious, and, being sheltered by several small islands, it affords secure moorings for the innumerable barks and junks which navigate the inland waters; all the foreign ships anchor several miles distant from the town, not on account of the incapacity of the harbour to accommodate them, but from the peculiarly jealous policy of the Chinese, which seems to dread nothing so much as sociality of intercourse. Canton consists of three towns, divided by high walls, but so conjoined as to form almost a regular square. The streets are long and straight, paved with flag-stones, and adorned with triumphal arches. The houses in general have only one floor, built of earth or brick, some of them fantastically colored, and covered with tiles. The better class of people are carried about in chairs; but the common sort walk barefooted and bareheaded. At the end of every street is a barrier, which is shut every evening, as well as the gates of the city. The Europeans and Americans occupy a range of buildings termed the factories, fronting a spacious quay along the bank of the river, without the city, which no foreigner is permitted to enter without the special permission of the viceroy, which is very seldom obtained. The foreign trade of Canton resolves itself into a monopoly more peculiar and oppressive than anywhere else exists; it is vested in twelve persons, precisely on the same principle as the twelve Jews are permitted to act as brokers in the city of London; each paying a large premium for the privilege of trading, or, in other words, as far as the principle applies in China, for the privilege of extorting from, and oppressing the producers of the commodities in which they trade. There is, however, this difference in China: though the whole of the twelve individuals trade on separate accounts, they are collectively amenable, as well to foreigners as to the government, for any default or mulct imposed upon any one or more of them individually; whereas each of the Jew brokers of London is responsible only for his own acts. In addition to the external commerce of Canton, it also appears to be the seat of almost every branch of manufacture, more especially of silks and household gods; the manufacture of the latter, in consequence of there being no public worship in China, and every house having its own collection of idols, forms one of the most important branches of occupation. The main article of export from Canton is Tea, which since 1798, to England alone, has averaged about 25,000,000 of lbs., whilst to America and other parts (since 1815 more especially) it has been gradually increasing, making an aggregate average quantity annually exported at the period of 1826, of about 40,000,000 lbs. The other principal articles exported to England are raw silk and nankeens, of the former about 250,000 lbs. weight, and of the latter, about 600,000 pieces, of four and seven yards each, annually; a few manufactured silks and crapes, porcelain vases, fans, ivory chess-men, fancy boxes, and other toys, soy, and ink, constitute the remaining exports to England, which employ about twenty-five sail of ships annually, of about 1200 tons each; the reimbursement by the English for the above productions is made in cotton wool, opium, and some other articles, from Bombay and Bengal, and in woollen cloths, lead, &c. from England, to the amount of about £700,000 annually. In addition to the trade direct to England, there is also an extensive traffic on English account between the different ports of India and Canton, which consists in a reciprocal interchange of the productions of the respective countries, and in which porcelain and paper form considerable articles of export from Canton. The intercourse of America with Canton, on the part of America, is maintained with furs from the North-west coast, sandal-wood, and the edible birds' nests, collected among the eastern islands, and with dollars; a considerable portion of the tea exported in American ships, being on account and risk of the Chinese merchants, more especially the portion brought to Hamburgh, Antwerp, and other European ports, is wholly reimbursed in specie. The imposts of the government on its external commerce are levied on the length and breadth of the shipping entering and leaving the port. The following statement of the amount of duties returned to the Chinese treasury, for the year 1822, will best show the extent and proportion of the three great branches into which the external commerce of Canton resolves itself: viz. 1st, that with the English East India Company; 2d, that with the different ports of British India; 3d, that with America :—

	On Import.	On Export.
Eng. East Ind. Comp.	395,112	460,042
Country Trade . . .	118,533	80,623
America	276,578	339,409
Total Tale . .	790,223	880,074

The tale being only equal to 6s. 8d. of English money, the whole impost will be seen to amount, according to the above statement, to only £556,800, not equal to the amount levied on the single article of coals alone, at the port of London; and yet such is the extent and insidious nature of the intermediate oppression of the Chinese hong (or council, which is the term by which the twelve privileged merchants of Canton are collectively called) on one side; and the English East India Company on the other; that whilst the 25,000,000 lbs. of tea annually consumed in Great Britain and Ireland, costs the consumer, on an average, at least 7s. per lb., it does not yield to the producer, including the inland conveyance to Canton, an average of 3½d. per lb.

In 1823 several thousand houses in Canton were destroyed by fire, but the ground has since been rebuilt upon. The population has been estimated at about 1,500,000, but more recent accounts imply that the extent of population, not only of Canton, but of China generally, has been greatly exaggerated. See on this head CHINA, and more particularly QUANGTONG. It is in the lat. of 23° 8′ N., and 113° 2′ of E. long., being 16° 47′, or about 1190 British statute miles south by west of Pekin, the metropolis of the empire.

of the empire.

ANTON (John), an ingenious natural philo-
er, born at Stroud, in Gloucestershire, in

1718. He was placed, when young, under the care of Mr. Davis, a very able mathematician, and had made some progress in algebra and astronomy, when his father took him from school, and put him to learn his own business, of a broad cloth weaver. This was not able to damp his zeal for knowledge. His leisure was devoted to the cultivation of astronomical science; and, by the help of the Caroline tables annexed to Wing's Astronomy, he computed eclipses of the moon and other phænomena. He also at this time computed and cut upon stone, with no better an instrument than a common knife, the lines of a large upright sun-dial, on which, besides the hour of the day, was shown the rising of the sun, his place in the ecliptic, &c. When this was finished and made known to his father, he permitted it to be placed against the front of his house, where it excited the admiration of several gentlemen in the neighbourhood, which was followed by the offer to this youth of the use of their libraries. In one of these he found Martin's Philosophical Grammar, which was the first book that gave him a taste for natural philosophy. In the possession of another gentleman, a few miles from Stroud, he first saw a pair of globes; an object that afforded him uncommon pleasure, from the great ease with which he could solve those problems he had hitherto been accustomed to compute. Among other persons with whom he became acquainted in early life, was the ingenious Dr. Miles, of Tooting, who, perceiving that Canton possessed abilities too promising to be confined within the narrow limits of a country town, prevailed on his father to permit him to come to London. After having served five years as clerk to Mr. Watkins, of the academy at Spital Square, he was taken into partnership, and succeeded him in the academy, where he continued during life. Towards the end of 1749, he undertook experiments to determine to what height rockets may be made to ascend, and at what distance their light may be seen. In 1750 was read at the Royal Society, his method of making artificial magnets, without the use of, and yet far superior to, any natural ones. This paper procured him the honor of being elected a member of the Society, and the present of their gold medal. The same year he was complimented with the degree of M.A. by the university of Aberdeen; and, in 1751, was chosen one of the council of the Royal Society. In 1752 he was so fortunate as to be the first person in England, who, by attracting the electric fire from the clouds during a thunder-storm, verified Dr. Franklin's hypothesis of the similarity of lightning and electricity. Next year, his paper entitled, Electrical Experiments, with an attempt to account for their several Phenomena, was read to the Royal Society. In the same paper Mr. Canton mentioned his having discovered, by a great number of experiments, that some clouds were in a positive, and some in a negative state of electricity. In the Lady's Dairy for 1756 our author answered the prize question that had been proposed in the preceding year; viz, 'How can what we call the shooting of stars be best accounted for; what is the substance of this phenomenon; and in what state of the atmosphere doth it most frequently show itself?' Our philosopher's next communication to the public was a letter in the Gentleman's Magazine for September, 1759, on the electrical properties of the tourmalin, in which the laws of that wonderful stone are laid down in a very concise and elegant manner. On December 13th, in the same year, was read at the Royal Society, An attempt to account for the regular diurnal variation of the Horizontal Magnetic Needle; and also for its irregular variation at the time of an Aurora Borealis. A complete year's observations of the diurnal variations of the needle are annexed to the paper. On November 5th, 1761, he communicated to the Royal Society an account of the Transit of Venus, June 6th, 1761, observed in Spital Square. His next communication was a letter addressed to Dr. Benjamin Franklin, and read February 4th, 1762, containing some remarks on Mr. Delaval's electrical experiments. On December 16th, 1762, another curious addition was made by him to philosophical knowledge, in a paper, entitled, Experiments to Prove that Water is not Incompressible. These experiments are a complete refutation of the famous Florentine experiment, which so many philosophers have mentioned as a proof of the incompressibility of water. On St. Andrew's day, 1763, he was elected the third time one of the council of the Royal Society; and on November 8th, in the following year, were read, before that learned body, his farther Experiments and Observations on the Compressibility of Water, and some other fluids. The establishment of this fact, in opposition to the received opinion, formed on the hasty decision of the Florentine Academy, was thought to be deserving of the Society's gold medal. It was accordingly moved for in the council of 1764; and after several invidious delays, which terminated much to the honor of Mr. Canton, it was presented to him November, 30th, 1765. His next communication to the Royal Society was on December 22nd, 1768, An easy Method of Making a Phosphorus, that will imbibe and emit light like the Bolognian Stone; with Experiments and Observations. The dean and chapter of St. Paul's having in a letter to the president, dated March 6th, 1769, requested the opinion of the Royal Society relative to the best and most effectual method of fixing electrical conductors to preserve that cathedral from damage by lightning, Mr. Canton was one of the committee appointed to take the letter into consideration, and to report their opinion upon it. The other members were, Dr. Watson, Dr. Franklin, Mr. Delaval; and Mr. Wilson. Their report was made on the 8th of June following; and the mode recommended by them was carried into execution. The last paper of our author's, which was read before the Royal Society, was on December 21st, 1769; and contained Experiments to prove that the Luminousness of the Sea arises from the Putrefaction of its Animal Substances. Besides the above, he wrote a number of papers, which appeared in different publications, particularly the Gentleman's Magazine. He fell into a dropsy, which carried him off, March 22nd, 1772, in the fifty-fourth year of his age.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment; the town where they are quartered being divided into as many cantons as there are regiments.

CAN'TRED, *n. s.* The same in Wales as an hundred in England. For cantre, in the British language, signifieth an hundred.

The king regrants to him all that province, reserving only the city of Dublin, and the *cantreds* next adjoining and the maritime towns. *Davies on Ireland.*

CANT-TIMBERS, in ship-building, those timbers which are situated at the two ends of a ship. They derive their name from being canted, or raised obliquely from the keel; in contradistinction from those whose planes are perpendicular to it. The upper ends of those on the bow, or fore part of the ship, are inclined to the stern; as those in the after, or hind part, incline to the stern-post above. See SHIP-BUILDING.

CANTUA, in botany, a genus of plants of the pentandria class, and monogynia order: CAL. five or three cleft: COR. funnel-shaped: STIG. three-cleft: CAPS. three-valved, three-celled, many-seeded: SEEDS winged. Species four; natives of South America.

CAN'TY, *adj.* Goth. *kat*; *kiat*; Swed. *katja*; gay, joyful, wanton; whence, Fr. *catin*, a woman of pleasure.

CANVAS, in commerce, a very clear unbleached cloth of hemp or flax, woven regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals of squares. Also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover women's stays; to stiffen men's clothes, and to make some other of their wearing apparel, &c.

CANVAS, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a slick-stone, then fixed, and afterwards whited over, makes what the painters call their primed cloth, on which they draw their first sketches with coal or chalk, and afterwards finish with colors.

CANVAS is also used among the French for the model or first words whereon an air or piece of music is composed, and given to a poet to regulate and finish. The canvas of a song contains certain notes of the composer, which show the poet the measure of the verses he is to make.

CAN'VASS, *v. a.* & *n.* } Per. *kanu*; Lat.
CAN'VASSING, } *cannabis*; Fr. *canevas*; Ital. *canavaccio*. Coarse hempen cloth, woven for several uses; as sails, painting cloths, tents. It is also so constructed as to be a sifting cloth, through which the lighter particles pass; but the grosser matter is retained. Thus it is metaphorically applied to sift, to examine; to sifting voices, or trying them, previously to the decisive act of voting: also to debate, to discuss; to separate the truth from error, as the sieve or canvass separates, by the act of straining, the heterogeneous mixtures that may be put into it.

The master commanded forthwith to set on all the *canvass* they could, and fly homeward. *Sidney.*

And eke the pens that did his pinions bind,
Were like main yards with flying *canvass* lin'd.
Spenser.

Eftsoones her shallow ship away did slide,
More swift than swallow sheres the liquid sky,
Withouten oare or pilot it to guide,
Or winged *canvas* with the wind to fly;
Onely she turn'd a pin; and by and by,
It cut away upon the yielding wave. *Spenser.*

There be that can pack cards, and yet cannot play well: so there are some that are good in *canvasses* and factions, that are otherwise weak men. *Bacon.*

Elizabeth being to resolve upon an officer, and being, by some that *canvassed* for others, put in some doubt of that person she meant to advance, said, she was like one with a lanthorn seeking a man. *Id.*

The curs discovered a raw hide in the bottom of a river, and laid their heads together how to come at it: they *canvassed* the matter one way and t'other, and concluded, that the way to get it, was to drink their way to it. *L'Estrange.*

Their *canvass* castles up they quickly rear,
And build a city in a hour's space. *Fairfax.*

Where'er thy navy spreads her *canvass* wings,
Homage to thee, and peace to all, she brings. *Waller.*

Spread a large *canvass*, painter, to contain
The great assembly and the numerous train. *Marvell.*

This crime of *canvassing*, or soliciting, for church preferment, is, by the canon law, called simony.
Ayliffe's Parergon.

Thou, Kneller, long with noble pride,
The foremost of thy art hast vied
With nature in a generous strife,
And touch'd the *canvass* into life. *Addison.*

So when a general bids the martial train
Spread their encampment o'er the spacious plain;
Thick rising tents a *canvass* city build,
And the loud dice resound thro' all the field. *Gay.*

Happy the maid, who, from green sickness free,
In *canvass* or in Holland pocket bears
A crooked sixpence. *Bramston.*

Then towered the masts; the *canvass* swelled on high;
And waving streamers floated in the sky.
Falconer's Shipwreck.

CANULA. See CANNULA.

CANUSIUM, in ancient geography, a town of Apulia, on the south side of the Aufidus, west of Cannæ; whither the Romans fled after the defeat sustained there. CANULA. See CANNULA.

CANUSIUM, in ancient geography, a town
of Apulia, on the south side of the Aufidus,
west of Cannæ; whither the Romans fled after
the defeat sustained there. It was founded by
Diomede, and afterwards became a Roman
colony. It was famous for its red shining wool,
whence those who wore clothes made of it were
called Canusinati. It is now called CANOSA;
which see.

CANUTE, the first Danish king of England.
He married Emma, widow of king Ethelred,
and put to death several persons of quality who
stood in his way to the crown. Having thus
settled his power in England, he made a voyage
to his kingdom of Denmark, in order to resist the
attacks of the king of Sweden; and carried along
with him a great body of the English, under the
command of Earl Godwin. This nobleman was
stationed next the Swedish camp; and observing
a favourable opportunity, he attacked the enemy
in the night, drove them from their trenches, and
obtained a decisive victory. In another voyage
which he afterwards made to Denmark, Canute
attacked Norway, and expelled the just but un-
warlike Olaus from his kingdom, of which he

---

kept possession till the death of that prince. By a spirit of devotion, no less than by his equitable administration, he gained in a great measure the affections of his subjects. Some of his flatterers breaking out one day in admiration of his grandeur, exclaimed, that every thing was possible for him: upon which the monarch, it is said, ordered a chair to be set on the sea shore while the tide was making; and, as the waters approached, he commanded them to retire, and to obey the voice of him who was lord of the ocean. He feigned to sit some time in expectation of their submission; but when the sea still advanced towards him, and began to wash him with its billows, he turned to his courtiers, and remarked to them, that every creature in the universe was feeble and impotent, and that power resided with one Being alone, in whose hands were all the elements of nature, who could say to the ocean, 'thus far shalt thou go, and no farther,' and who could level with his nod the most towering piles of human pride and ambition. From this time, it is said, he never would wear a crown. He died in the twentieth year of his reign; andwas interred at Winchester.

CANZONE, in music, signifies, in general, a song, where some little fugues are introduced: but it is sometimes used for a sort of Italian poem, usually long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata: if placed in any part of a sonata, it implies the same meaning as allegro, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CAN'ZONET, *n. s.* Ital. *canzonetta.* A little song.

Vecchi was most pleasing of all others, for his conceit and variety, as well his madrigals as *canzonets.*
Peacham.

CAOUTCHOUC, or Indian rubber, an elastic gum, produced from the jatropha elastica and other plants of South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is capable of resisting the action of very powerful menstrua. The Indians make boots of it, which water cannot penetrate, and which, when smoked, have the appearance of real leather; bottles are also made of it. Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, they give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which the inhabitants of Quito apply to the same purposes as our oil-cloth and sail-cloth. It is formed by moulds into a variety of figures for use and ornament. The great Frederick king of Prussia had a pair of boots made of caoutchouc. A mould of wrought clay, the exact figure of his leg, was covered with ethereal solution of caoutchouc, laid on in alternate layers by a brush, until it acquired the proper thickness; the whole was then held over a strong smoke of burning vegetables, to harden into the texture and appearance of leather. When the whole was thus prepared the inside mould was broken and taken out. To form this resin into small tubes, M. Macquer prepared a solid cylindrical mould of wax, of the desired size and shape, and then, dipping a pencil into the ethereal solution of the resin, coated the mould over with it, till he had covered it with a coat of resin of a sufficient thickness. He then threw the whole piece into boiling water; by the heat of which the wax soon melted, and rising to the surface left the resinous tube completely formed. Mr. Macintosh has a patent for cloth rendered water-proof with a solution of caoutchouc. If linseed oil be rendered very drying by digesting it upon an oxide of lead, and afterwards applied with a small brush on any surface, and dried by the sun or in the smoke, it makes an artificial caoutchouc, and it will afford a pellicle of considerable firmness, transparent, burning like caoutchouc, and wonderfully elastic. A pound of this oil, spread upon a stone, and exposed to the air for six or seven months, acquires almost all the other properties of caoutchouc: it is used to make catheters and bougies, to varnish balloons, and for other purposes. It will also answer the same end in rubbing out pencil marks.

CAP, *n.* & *v. a.* Welsh *cap*; Sax. cæppe; Germ. *cappe*; Fr. *cappe*; Ital. *cappa*; Span. *cappa*; Dan. and Dutch *kappe*; Lat. *caput*; a head. A covering for the head, that which is usually worn; and a vessel, used by divers, to protect the head, and secure free respiration, when under water. Anything that covers the top, or that which is topmost and highest. It is technically applied to a piece of lead, laid over the touch-hole of a gun, to preserve the prime. The cap of maintenance is one of the regalia, carried before the king at his coronation. To cap, is to cover the head; to make a reverence by uncovering it. To protect that by covering, which exposure would injure or weaken. It also signifies to contend, from Goth. and Swed. *kapp*; Sax. camp, to contest; see *To* COPE. Thus it has been applied to striving for the mastery, and to rival conflicts, whether personal, literary, or skilful, for superiority. To cap verses is to name, alternately, verses beginning with a particular letter; to name in opposition to emulation; to name, alternately, in contest. To cap, is likewise to deprive of the cap; to take it by force or fraud. Shakspeare uses the noun in the same sense in which we now apply the term hat as the ensign of the cardinalate.

For I wol tell a legend and a lif
Both of a carpenter and of his wif,
How that a clerk hath the wrighte's *cappe.*
Chaucer's Canterbury Tales.

If one, by another occasion, take any thing from another, as boys sometimes use to *cap* one another, the same is straight felony. *Spenser on Ireland.*

Here is the *cap* your worship did bespeak.—
—Why, this was moulded on a poringer,
A velvet dish. *Shakspeare. Taming of the Shrew*

I have ever held my *cap* off to thy fortune.—
—Thou hast served me with much faith. *Id.*

Three great ones of the city,
In personal suit to make me his lieutenant,
Oft *capped* to him:—and by the faith of man,
I know my price, I'm worth no worse a place.
Shakspeare. Othello.

They more and less came in with *cap* and knee,
Met him in boroughs, cities, villages. *Id. Henry IV.*

Thou art the *cap* of all the fools alive. *Id. Timon.*

Enicus, king of Sweden, had an inchanted *cap*, by virtue of which, and some magical murmur or whispering terms, he could command spirits, trouble the ayre, and make the wind stand which way he would; insomuch, that when there was any great wind or storm, the common people were wont to say the king now had on his conjuring *cap*. *Burton. Anat. Mel.*

At the court gate met him four noblemen in cloth of gold, and rich fur *caps*, embroidered with pearl and stone. *Milton. Hist. Moscovia.*

The bones next the joint are *capped* with a smooth cartilaginous substance, serving both to strength and motion. *Derham.*

Where Henderson and the other masses,
Were sent *cap* texts, and put cases. *Hudibras.*

Sure it is a pitiful pretence to ingenuity that can be thus kept up, there being little need of any other faculty but memory, to *cap* texts. *Government of the Tongue.*

There is an author of ours, whom I would desire him to read, before he ventures at *capping* characters. *Atterbury.*

First, lolling sloth, in woollen *cap*,
Taking her after dinner nap. *Swift.*

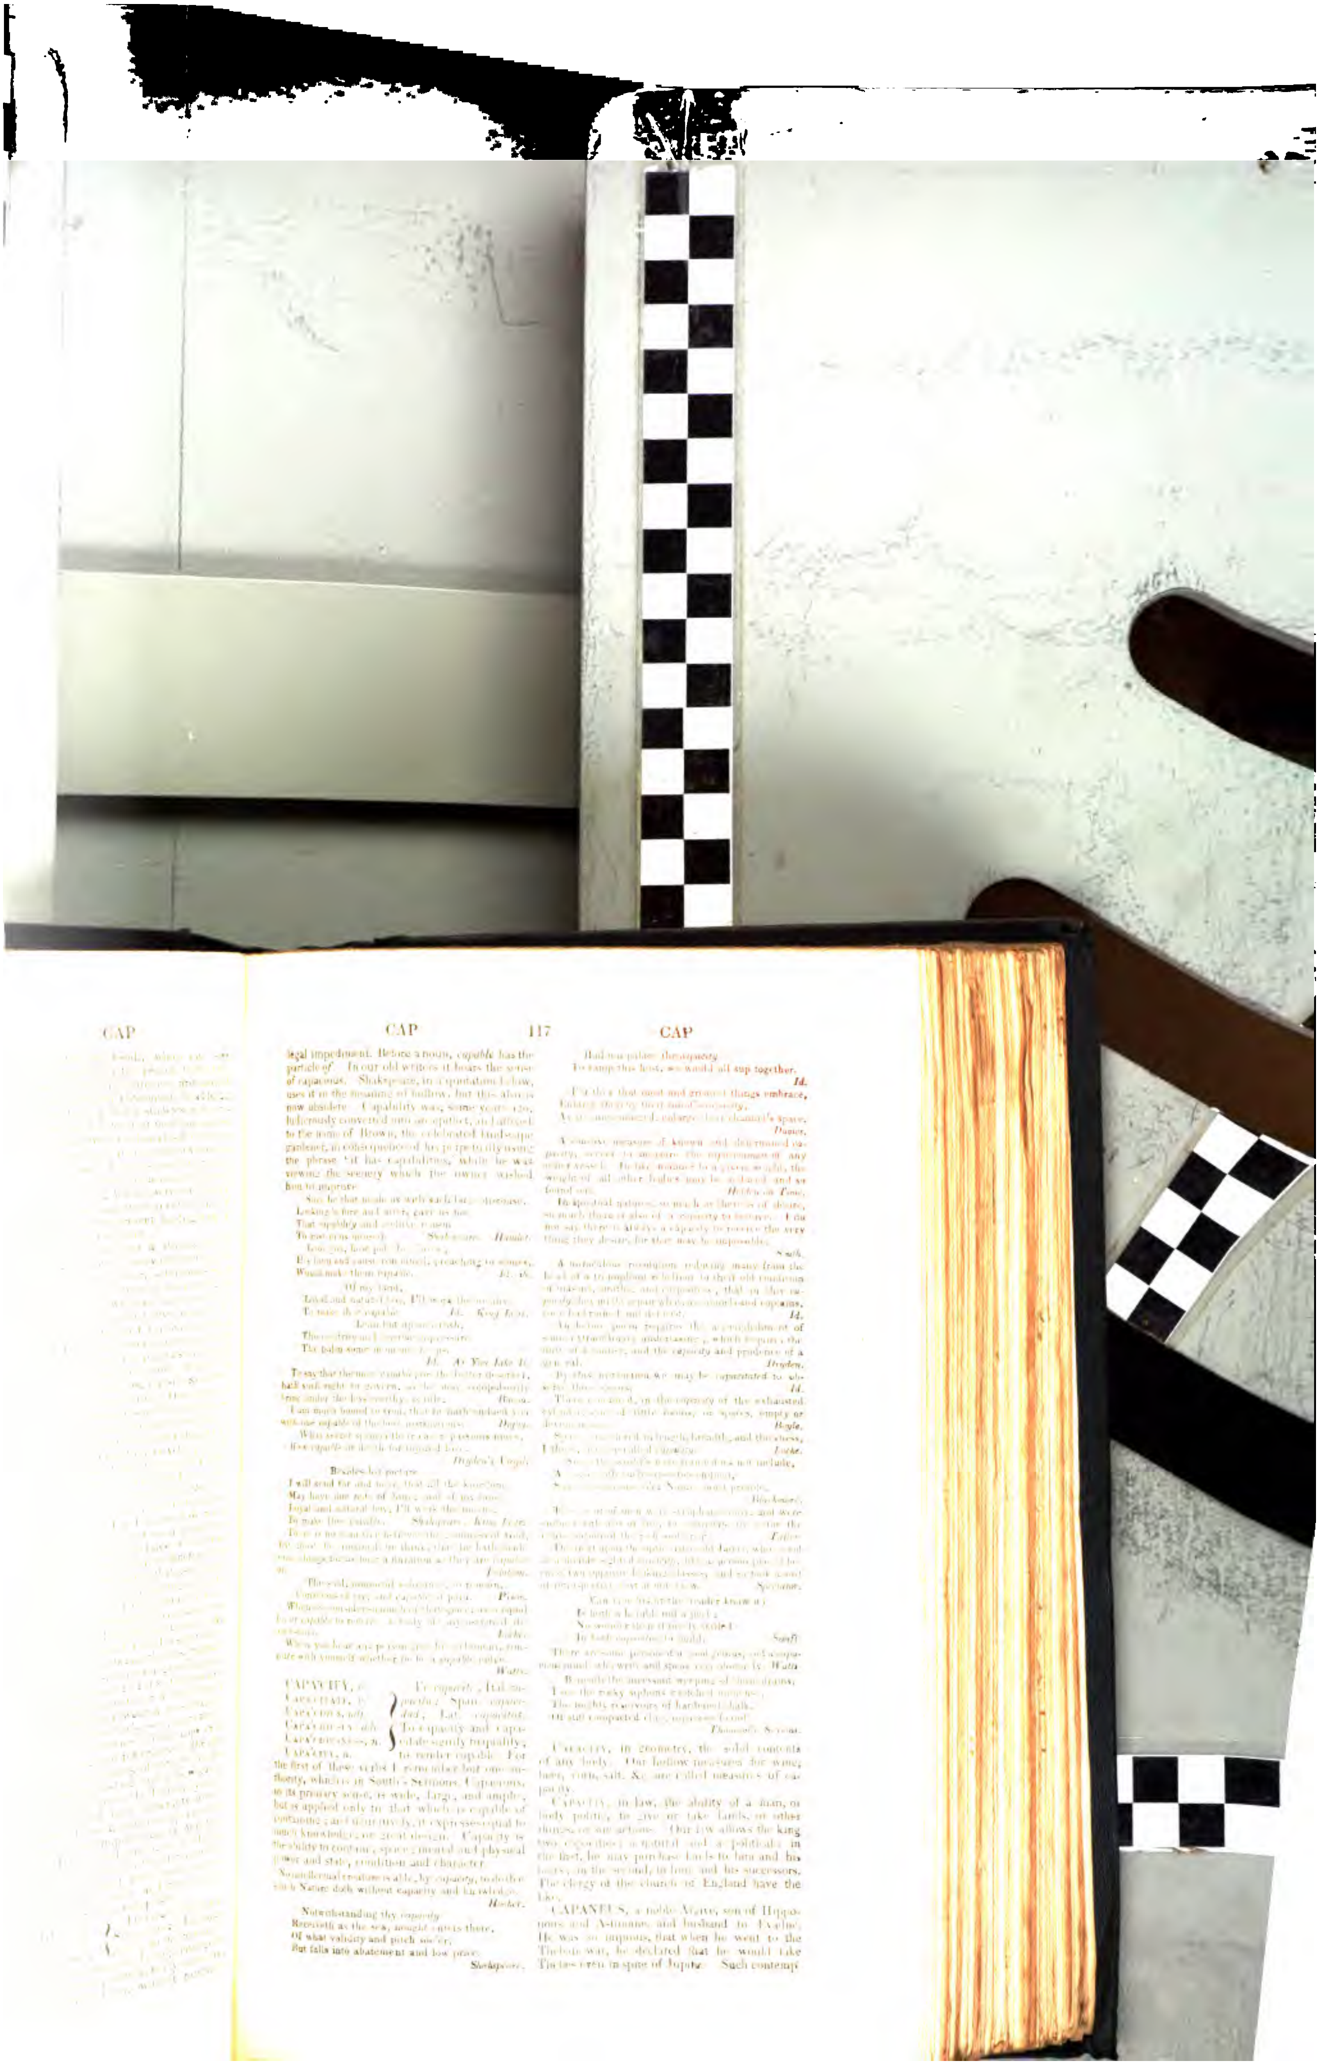
Cap, in ship-building, a strong, thick, block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is furnished with two holes, perpendicular to its length and breadth, and parallel to its thickness: one of these is square and the other round; the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position. The breadth of all caps is equal to twice the diameter of the top-mast, and the length to twice the breadth. The thickness of the main and fore-caps is half the diameter of their breadths; the mizen-cap three-sevenths, and the top-mast caps two-fifths of their respective breadths.

Caps, Ancient. The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the ancient statues appear bare-headed, excepting sometimes a wreath or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no caps were known. The sort of caps or covers of the head in use among the Romans on divers occasions, were the pitra, pileus, cucullus, galerus, and palliolum; the differences between which are often confounded by ancient as well as modern writers.

The general use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of chaperoons, or hoods. When the cap was of velvet, they called it mortier; when of wool, simply bonnet. None but kings, princes, and knights, were allowed the use of the mortier. The cap was the head-dress of the clergy and graduates. Pasquier says, that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off as an incumbrance, left the round cap an easy commodious cover for the head; which cap being afterwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman, called Patrouillet: he adds, that the giving of the cap to the students in the universities, was to denote, that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a pileus, or cap, to their slaves, in the ceremony of making them free: whence the proverb, Vocare servos ad pileum. Hence, also, on medals, the cap is the symbol of liberty, whom they represent holding a cap in her right hand, by the point.

The French clergy wear a shallow kind of cap, called calotte, which only covers the top of the head, made of leather, satin, worsted, or other stuff. The red cap is a mark of dignity allowed only to those who are raised to the cardinalate. During the first five years of the French revolution, the red cap was a mark of democracy. The secular clergy are distinguished by black leathern caps, the regulars by knit and worsted ones. Churchmen, and members of universities, students in law, physic, &c. as well as graduates, wear square caps. In most universities, doctors are distinguished by peculiar caps, given them on assuming the doctorate. In that of Edinburgh, the principal only touches the young graduate's head with a velvet cap. Wickliffe calls the canons of his time bifurcati, from their caps. Pasquier observes, that in his time, the caps worn by the churchmen, &c. were called square caps; though, in effect, they were round yellow caps. The Chinese have not the use of the hat, like us; but wear a cap of peculiar structure, which the laws of civility will not allow them to put off: it is different for the different seasons of the year: that used in summer is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with satin; to this is added, at top, a large lock of red silk, which falls all round as low as the bottom; so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance; sometimes, instead of silk, they use a kind of bright red hair, the lustre of which no weather effaces. In winter they wear a plush cap, bordered with martlet's or fox's skin; as to the rest, like those for the summer. These caps are frequently sold for eight or ten crowns. The cap is sometimes used as a mark of infamy; in Italy the Jews are distinguished by a yellow cap; at Lucca by an orange one. In France, by the old laws, those who had been bankrupts were obliged ever after to wear a green cap to prevent people from being imposed on in any future commerce. By several arrets, in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their green cap, their protection should be null, and their creditors empowered to cast them into prison.

CA'PABLE, *adj.*
Capabil'ity, *n.*
Ca'pableness, *n.*
} Fr. *capable*; It. *capace*; Span. *capaz*; Lat. *capax*, *capio*; fit to receive, or do; power of receiving, or doing; intelligent; able to understand; intellectually capacious; susceptible; qualified for, without natural or



legal impediment. Before a noun, *capable* has the particle *of*. In our old writers it bears the sense of capacious. Shakspeare, in a quotation below, uses it in the meaning of hollow, but this also is now obsolete. Capability was, some years ago, ludicrously converted into an epithet, and affixed to the name of Brown, the celebrated landscape gardener, in consequence of his perpetually using the phrase 'it has capabilities,' while he was viewing the scenery which the owner wished him to improve.

Sure he that made us with such large discourse,
Looking before and after, gave us not
That *capability* and godlike reason
To rust in us unused. *Shakspeare. Hamlet.*
Look you, how pale he glares;
His form and cause conjoin'd, preaching to stones,
Would make them capable. *Id. ib.*
Of my land,
Loyal and natural boy, I'll work the means
To make thee capable. *Id. King Lear.*
Lean but upon a rush,
The cicatrice and capable impressure
Thy palm some moment keeps.
Id. As You Like It.

To say that the more capable, or the better deserver, hath such right to govern, as he may compulsorily bring under the less worthy, is idle. *Bacon.*

I am much bound to God, that he hath endued you with one capable of the best instructions. *Digby.*

When secret sympathies in a cause of passions move,
Are *capable* of death for injured love.
Dryden's Virgil.

Besides his picture
I will send far and near, that all the kingdom
May have due note of him; and of my land,
Loyal and natural boy, I'll work the means
To make thee capable. *Shakspeare. King Lear.*

There is no man that believes the immortality of the soul, but must be inclined to think, that he hath made some things for as long a duration as they are *capable* of. *Tillotson.*

The soul, immortal substance, to remain,
Conscious of joy, and *capable* of pain. *Prior.*

When we consider so much of that space as is equal to or *capable* to receive a body of any assigned dimensions. *Locke.*

When you hear any person give his judgment, consult with yourself whether he be a *capable* judge. *Watts.*

CAPA'CITY, *n.* ⎫ Fr. *capacité*; Ital. *capacità*; Span. *capacidad*; Lat. *capacitas*. To capacity and capacitate signify to qualify, to render capable. For
CAPA'CITATE, *v.*
CAPA'CIOUS, *adj.*
CAPA'CIOUSLY, *adv.*
CAPA'CIOUSNESS, *n.*
CAPA'CITY, *n.* ⎭

the first of these verbs I remember but one authority, which is in South's Sermons. Capacious, in its primary sense, is wide, large, and ample; but is applied only to that which is capable of containing; and figuratively, it expresses equal to much knowledge, or great design. Capacity is the ability to contain; space; mental and physical power and state, condition and character.

No intellectual creature is able, by *capacity*, to do that which Nature doth without capacity and knowledge. *Hooker.*

Notwithstanding thy *capacity*
Receiveth as the sea, nought enters there,
Of what validity and pitch soe'er,
But falls into abatement and low price.
Shakspeare.

Had our palace the *capacity*
To camp this host, we would all sup together.
Id.

For this, that most and greatest things embrace,
Enlarges thus their mind's capacity,
As streams resolved, enlarge their channel's space.
Davies.

A concave measure of known and determined capacity, serves to measure the capaciousness of any other vessel. In like manner to a given weight, the weight of all other bodies may be reduced and so found out. *Holder on Time.*

In spiritual natures, so much as there is of desire, so much there is also of a capacity to receive. I do not say there is always a capacity to receive the very thing they desire, for that may be impossible.
South.

A miraculous revolution reducing many from the head of a triumphant rebellion to their old condition of masons, smiths, and carpenters, that in that *capacity* they might repair what, as colonels and captains, they had ruined and defaced. *Id.*

An heroic poem requires the accomplishment of some extraordinary undertaking, which requires the duty of a soldier, and the *capacity* and prudence of a general. *Dryden.*

By this instruction we may be *capacitated* to observe those errors. *Id.*

There is no doubt, in the capacity of the exhausted cylinder, store of little rooms, or spaces, empty or devoid of air. *Boyle.*

Space, considered in length, breadth, and thickness, I think, may be called *capacity*. *Locke.*

Since the world's wide frame does not include,
A [illegible],
[illegible] Nature [illegible].
Blackmore.

[illegible] *Felton.*

[illegible] *Spectator.*

Can [illegible] the reader know it;
Is both a herald and a poet;
No wonder then if nicely skill'd
In both *capacities* to build. *Swift.*

There are some persons of a good genius, and a capacious mind, who write and speak very obscurely. *Watts.*

Beneath the incessant weeping of these drains,
I see the rocky siphons stretch'd immense,
The mighty reservoirs of harden'd chalk,
Or stiff compacted clay, capacious found.
Thomson's Seasons.

CAPACITY, in geometry, the solid contents of any body. Our hollow measures for wine, beer, corn, salt, &c. are called measures of capacity.

CAPACITY, in law, the ability of a man, or body politic, to give or take lands, or other things, or sue actions. Our law allows the king two capacities; a natural and a political: in the first, he may purchase lands to him and his heirs; in the second, to him and his successors. The clergy of the church of England have the like.

CAPANEUS, a noble Argive, son of Hipponous and Astinome, and husband to Evadne. He was so impious, that when he went to the Theban war, he declared that he would take Thebes even in spite of Jupiter. Such contempt

provoked the god, who struck him dead with a thunderbolt. His body was burnt separately from the others, and his wife threw herself on the burning pile to mingle her ashes with his. It is said that Æsculapius restored him to life.

CAP-A'-PE', } Fr. *cap-à-pie*. From head
Cap-a'-pie'. } to foot; all over; completely armed.

> A figure like your father,
> Armed at all points, exactly *cap-a-pe*,
> Appears before them, and, with solemn march,
> Goes slow and stately by them.
>
> *Shakspeare. Hamlet.*

> There for the two contending knights he sent,
> Armed *cap-a-pie*, with reverence low they bent.
>
> *Dryden. Fables.*

> A woodlouse,
> That folds up itself in itself for a house,
> As round as a ball, without head, without tail,
> Inclosed *cap-a-pe* in a strong coat of mail. *Swift.*

CAPAR'ISON, *v.* & *n.* Fr. *caparaçon*; Span. *caparazon*; from Lat. *capio* and *paro*. It was formerly spelt caparasson, and signifies, primarily, the bards or trappings of a horse, but is applied ludicrously to any pompous dress. The homely definition given by the Farmer's Dictionary is, 'a horse cloth, or a sort of cover for a horse, which is spread over his furniture.'

> Don't you think, though I am *caparisoned* like a man, I have a doublet and hose in my disposition?
>
> *Shakspeare. As You Like It.*

> Tilting furniture, emblazoned shields,
> Impresses quaint, *caparisons*, and steeds,
> Bases, and tinsel trappings, gorgeous knights
> At joust and tournament. *Paradise Lost.*

> Some wore a breast-plate, and a light juppon,
> Their horses clothed with rich *caparison*.
>
> *Dryden's Fables.*

> The steeds *caparisoned* with purple stand,
> With golden trappings, glorious to behold,
> And champ betwixt their teeth the foaming gold.
>
> *Dryden.*

CAPE, *n.* Fr. *cape*; Ital. *capo*; Dan. *kappe*; Lat. *caput*. A headland, a promontory; also the neck piece of a cloak. Its application from the Latin is quite obvious in the first case, and not obscure in the second; the cape being, as Minsheu observes, the superior part of the garment. In the northern languages, it is not from the whole head, but from the nose, that the designation of a promontory is derived; and from them many headlands both on the French and English coasts received names, as in Dungeness, Cape Grisnez, &c.

> What from the *cape* can you discern at sea?
> Nothing at all; it is a high wrought flood.
>
> *Shakspeare. Othello.*

> The parting sun,
> Beyond the earth's green *cape* and verdant isles,
> Hesperian sets, my signal to depart.
>
> *Paradise Lost.*

> The Romans made war upon the Tarentines, and obliged them by treaty not to sail beyond the *cape*.
>
> *Arbuthnot.*

> But now Athenian mountains they descry,
> And o'er the surge Colonna frowns on high.
> Beside the *cape's* protecting verge is placed
> A range of columns, long by time defaced.
>
> *Falconer.*

> He was cloathed in a robe of fine black cloth, with wide sleeves and *cape*. *Bacon.*

Cape, in law, a judicial writ concerning plea of lands or tenements, and divided into cape magnum and cape parvum, both of which affect things immovable.

Cape magnum is designed to lie where a person has brought a præcipe quod reddat of a thing that touches a plea of land, and the tenant makes default at the day given to him in the original writ; then this writ shall go for the king, to take the land into his hands: and if he comes not at the day given him, he loses his land, &c.

Cape parvum, called petit-cape, is defined thus: when the tenant is summoned in plea of land, and cometh at the summons, and his appearance is recorded; and after he maketh default at the day that is given to him, then this writ shall go for the king.

Cape Coast Castle. See Africa and Ashantee.

Cape de Verd Islands. See Verde, Cape de.

Cape of Good Hope. The colony of the Cape of Good Hope, stretches along the whole of the southern extremity of Africa from the cape of that name (originally called Cabo dos Tormentos, the Cape of Storms, by the Portuguese) to the Great Fish river, the Rio d' Infante of the Portuguese, or from 17° 36' to 28° 17' E. long. and lies between 29° 55' and 34° 17' S. lat. Its most western point is at the mouth of the Koussie river, which, with the Bosjesman's country, forms the northern boundary of the colony; on the west and south it is bounded by the Atlantic and Indian Oceans; and on the east by Kaffreland. Its length from west to east, from the point of the Cape Peninsula to the mouth of Fish river, is 580 miles; from the river Koussie to the Snowy Mountains 520 miles: giving a mean breadth of about 550 miles. Its breadth from south to north, from the mouth of the Koussie to the Cape Point, is 315 miles; from the Nieuwveldt Mountains to Plettenberg's bay 160 miles: giving a mean breadth of 223 miles, and including an area of 128,150 square miles, according to the chart constructed by order of lord Macartney, during the British possession of the colony, prior to the peace of Amiens. On the east, upon which the Caffre tribes are often making incursions, it is necessary to preserve the chain of posts particularly strong. Northward the boundary line is little more than imaginary, being formed by the commencement of arid sands, stretching into the interior of the continent, or the winding ranges of barren hills, where no settled tribes can exist. Over this district are scattered 61,947 inhabitants (exclusive of the British army and navy), according to the latest returns: of whom 10,983 are white males, 9,482 white females; 1,281 servants and people of color; 25,754 slaves; and 14,447 Hottentots.

The whole colony is intersected by chains of mountains crossing it from east to west, and generally barren; some few ranges on the western coast run from south to north, and one in particular, which begins at False Bay opposite the Cape Point, stretches northward to Olifant river, an extent of about 210 miles.

The most southern of the former chains leaves

he most southern of the former chains leaves

a belt of coast of irregular breadth, varying from 20 to 60 miles) which is well covered with soil, indented with bays, and watered by numerous streams. The second great chain, formed by the Zwarte Berg or Black Mountains, is of much greater elevation, and more rugged in appearance than the former. It frequently breaks like the Andes of the New Continent, into double and treble ranges, and encloses with the first a series of elevated plains of about the general width of the coast lands from north to south, but very various in their character; occasionally presenting nothing but a succession of clay flats, known by the name of Karroo. In other places small plantations and farms meet the eye, on the borders of feeble streams; and are as extremely productive as the surrounding flats are barren. The whole of these lands are much higher than those to the south of the ranges, and the temperature is as various as the aspect of the country. The third principal chain, of a still greater average height, is denominated the Nieuwveldt's Gebergte, and forms the northern boundary of a vast uninhabited karroo, or desert, commencing at the foot of the second. Here severe frosts in the bad monsoons, and the vehement heats of the summer months, seem alike the enemies of all vegetation, and human habitations rarely relieve the waste.

Of the various bays that indent the long range of coast possessed by this colony, False Bay and Table Bay, the former on the southern, and the latter on the western shore of the Cape Peninsula, are the principal resort for shipping. From September to May, usually reckoned as the summer months, Table Bay presents a secure shelter from the south-east winds; and during the rest of the year False Bay, and its cove or adjunct, Simon's Bay, are preferred, as shielding vessels from the northern and north-west winds. Hout, or Wood Bay and Chapman's Bay, on the west coast, are also frequently entered The first of these, though small, is remarkably sheltered by the surrounding heights; but the eddy winds, caused by that circumstance, render it difficult of egress and regress. Between Simon's Bay and Cape Town is a remarkable pass, which may be called the Thermopylæ of the Cape, and to which, as well as indeed to all the principal bays and passes of the colony, the attention of government has of late been particularly directed. This pass is now supposed to be impregnable to any army that could be landed in the bay. Saldhana Bay, in lat. 33° S. is commodious and well sheltered, being about fifteen miles long from north to south, and from two to three miles broad, and running between lofty granite hills; but wood and water are very scarce in the neighbourhood. The rivers on the western coast are Olifant or Elephant River, which empties itself into the Atlantic in S. lat. 31° 30′.; and the Berg, or Mountain River, which has its source in the Roggeveldt Mountains, and after receiving several minor streams in its passage, falls into St. Helena bay. On the south are Gauritz River, the principal stream that waters the colony, and which, descending from the Black Mountains, becomes during the rains a very rapid torrent; Broad River, falling into Sebastian's Bay, and nearly a mile in width at the mouth; Camtoos River, running into a bay of the same name, and deep enough within the bar to float a ship of the line; Sondag, or Sunday River, which rises in the Nieuwveldt or Snow Mountains, and after watering a considerable portion of the Graaff Reynet district, discharges itself in a south-east direction in Zwart Kops or Algoa Bay; Zwart Kops River; and the Great Fish River, which takes its rise in the Snow Mountains, at a distance of 200 miles from the sea. None of these streams are calculated for the navigation of vessels of burden, being almost uniformly blocked at the mouths by beds of sand or reefs of rock; they are, however, well stored with fish, particularly with a small kind of turtle, perch, and eels; and are exceedingly prized by the colonists for the fertility which crowns their banks.

The climate of this colony is, on the whole, salubrious, but subject to very sudden changes of temperature. During what is called the good monsoon, or the summer months, commencing in September, south-east winds are most frequent, and, springing up about noon, drive the whole atmosphere into circulation, and die away in the evening, which is delightfully cool and exhilarating. Sometimes, however, they assume a more violent and stormy character; a dry and blasting heat attends them, and sweeps over the land like a mildew; relaxing the human frame, and spreading destruction among the luxuriant fruits of the district. In the bad monsoon, or winter months, north-east winds prevail. There seem to be few or no diseases peculiar to this spot; in Cape Town, however, the instances of longevity are rare, and bilious fevers are frequent everywhere among the slaves. The annual deaths in the town, taken on the average of eighty years, were about two and a-half per cent. among the white, and three per cent. among the slave population.

The territory of the cape was divided by the Dutch into four districts or drosdys, each of which was governed by a landrost, and a council of six hemraaden. These were, 1. The Cape. 2. Stellenbosch and Drakenstein. 3. Zwellendam, and 4. Graaff Reynet. The Dutch system of government has been followed by the British, but subdivisions of the country districts have taken place. The northern part of what was once the united district of Stellenbosch and Drakenstein, has been called the district of Tulbagh, and a new drosdy and landrostship has been erected. District George has been formed out of the southern parts of Zwellendam, east of the river Gauritz; and the southern part of Graaff Reynet has been called the district of Uitenhagen. That of the Cape is by far the most important of these governments, and reaches from St. Helena Bay, to the breadth of twenty-five miles from the shores of the ocean; being about eighty miles in length; twenty-five in breadth; and containing an area of 2000 square miles.

Cape Town, the capital, is situated in the bosom of hills branching out from the Table Mountain, and is a neat and well built place The streets throughout are at right angles with each other, and composed of houses mostly built of stone. Many have canals running down them, shaded with avenues of oaks, and a fine stream from Table Mountain fertilises the neighbourhood. There are several handsome squares devoted to the public markets and military purposes; a Calvinist and Lutheran church, guard-house, justice court, and theatre. The government house is on the side of Table Mountain, surrounded by a fine public garden, and several handsome villas. Eastward of the town is a pentagon fort or castle, surrounded with a ditch and outworks, which enclose the bank, called the Lombard bank, the orphan chamber, and other public offices; here also are a magazine for military stores, and barracks for 4,000 men. The town is further defended by several forts on the shores of Table Bay; the principal of which are Fort Knokke, connected with the castle by the rampart called the Sea lines, and Craig's Tower, east; the Lion's Rump, Rogge Bay battery, Amsterdam, and Chavenne battery, west; and an important outwork, called the Mouille, at the entrance of the bay. The inhabitants are estimated at about 5,500 whites and people of color, and 10,000 blacks.

The Table Mountain is too conspicuous a feature of this part of the colony to escape the attention of any stranger; while it will reward the most scientific investigation of its natural history, and presents some very curious mineralogical facts. At a distance it assumes the appearance of an immense battlement in ruins, crowned during the summer months with an elegant fleecy cloud, which, in allusion to the popular name of the central part of the mountain has been not unaptly called the Table Cloth. The north front, facing Cape Town, forms a horizontal line at top, of about two miles in length, the face of which is supported by a number of projecting rocks that stand out upon the plain below like buttresses, and terminate in the mountain about midway towards the summit. Two great chasms divide the upper part of its face into three distinct eminences (the centre one falling back, and its wings or bastions projecting forward), which are named from east to west, the Devil's Head, Table Mount, and Lion's Head. Along the sea shore the west side is highly picturesque, presenting a vast number of pointed and time-worn masses, rising at last into a solid rounded block, resembling, according to some descriptions, the dome of St. Paul's cathedral placed upon a conical-shaped eminence. This part of the mountain is 3315 feet above the level of the sea; the eastern wing (the Devil's Hill) is also remarkable for its craggy broken brow; it runs off at right angles to the front, and is the most elevated of the three summits, being 3582 feet in altitude. The Table, properly so called, is only 2160 feet above the bay. Southward the mountain breaks away in steps or terraces into the chain that extends along the whole Cape Peninsula. A deep chasm, that divides the curtain from the left bastion of the mountain, leads the way from the town to the summit of this romantic elevation. Its length is about three quarters of a mile, and the angle of ascent through it about forty-five degrees. The entrance is particularly imposing. Perpendicular walls of granite here rise on each side of the passenger, at the distance of eighty yards from each other, to the height of 1000 feet, and gradually close towards the opening at the top, on which he in a moment finds himself commanding a boundless view. The penæa mucronata, a tall and elegant shrub, is peculiar to this spot; as also a species of heath, called the physodes, which bears a beautiful cluster of white flowers. The air on the summit is in most parts of the year mild and pleasant; in winter it is about 15° of Fahrenheit lower than at Cape Town; and in summer still more, through the density of the Table Cloud.

Stellenbosch, and Drakenstein, are districts of the former Dutch division, which comprehended the present divisions of Stellenbosch and Tulbagh. They were formerly governed by one landrost and two heemraaden, but are now entirely distinct governments, and extend together, from Cape l'Agullas south, to the river Koussie northward, and from the ocean and the Cape district west, to Breede River and the Gamka, or Lion's River eastward; having a mean length of 380 miles, and a breadth of about 150; enclosing an area of 55,000 square miles. Scarcely a twentieth part of this area is in a state of cultivation. The valley of Drakenstein, however, on the east of the Cape, is well inhabited, and the sections of these districts between False Bay and the long range of mountains that run northward to the Elephant River, are amongst the most fruitful parts of the colony. East Zwartland, and the neighbourhood of the twenty-four rivers, are valleys in this direction that are called the Granaries of the Cape; and the Roggeveldt mountains and valleys yield a large and strong breed of horses, originally introduced from South America.

The original district of Zwellendam comprehended the most southern belt of land in the colony, lying between the Black Mountains and the ocean, north and south; and the district of Stellenbosch, and that of Graaff Reynet, east and west. It was about 380 miles long, and sixty broad, containing an area of 19,000 square miles. District George now cuts off about one-half of the fruitful portion of this district towards the south. The mountains of the coast are clothed with forest trees, and the plains with shrubs. This part of the colony as a whole is more fruitful than any other; and contains one subdivision out of which the Dutch government reserved 20,000 acres of land in its own hands for the growth of corn, of which it yielded 10,000 muids annually, besides nourishment for 1000 horses, and 1000 head of cattle. The village of Zwellendam is situated in a delightful valley, and the new rising town of the name of George, is in the immediate neighbourhood of the land just mentioned.

Graaff Reynet district is bounded on the north by the Bosjesmans' country, or the limits of the colony in this direction; on the south by the districts George, Uitenhagen, and the sea; west by part of Zwellendam; and east by Kaffreland. The eastern subdivisions (by far the most productive) are molested by the incursions of the Kaffres and Bosjesmans, who recently seized

---

and murdered the landrost of the district, with all his family, at his own residence in the village of Graaff Reynet. Very little grain is grown in this district, from the difficulty of its finding a market, and from the circumstance of the frequent descent of locusts from the mountains; but cattle and sheep thrive well here. The village at which the landrost resides scarcely boasts a dozen houses besides his own. In the Sneuwberg division of this district on the banks of the Fish River, are two mineral springs of great repute among the colonists, for the cure of rheumatic and cutaneous disorders; the water is at the temperature of 88° Fahrenheit. South of these waters, and west of Sunday River, is a large salt water lake, which is an object of resort for the inhabitants of various neighbouring and remote regions, who obtain a valuable supply of that mineral from it annually. The salt is taken out in masses of from four to six inches thick, which are broken down on the banks of the lake, where a much finer salt accumulates after a dry wind; the latter indeed is said to equal in its native state any of the refined salts of this country.

The predominant soils of this colony are a stiff clay, into which no plough will enter until it is thoroughly soaked with rain, and a light red sand, capable of extreme fertility wherever it is sufficiently irrigated. The superinduced soil, which is furnished by the decomposition of vegetables, is of course rarely seen in a country everywhere penetrated by ranges of naked mountains, and three-fifths of whose surface wears not the least appearance of verdure during the greater part of the year. Sometimes, indeed, where these eminences form a channel for the floods of the rainy season, or natural springs are found, a singular luxuriance will appear in the valleys, and many farmers have cultivated these patches among the mountains on the southern coast; but no part of the earth has hitherto seemed abandoned to more complete sterility than the greater portion of those vast karroo plains that occupy the interstices between the great mountain-ranges. Impenetrable clays, strewed with sand, stretch for miles under the aching eye; and the larger and smaller hills that interrupt the surface are only diversified masses of sandstone, blue slate, felspar, and ironstone, in the midst of which a single blade of grass is rarely seen.

The operations of nature are here, however, conducted in singular extremes. Where iron or its oxydes are liberally mixed with the clay, and the fertilising aid of the feeblest rill can be brought to bear upon the soil, astonishing fertility will occasionally ensue; some of the best grapes and fruits of the colony are yielded on these spots, the influence of a few showers of rain in other places is equally remarkable; parched as they will appear with the hot season, and utterly deserted by everything living, the rains of a few days will clothe whole acres with verdure; the botanist is suddenly presented with the richest harvest of plants that is to be found in any country; and flocks of antelopes are quietly grazing. Of the capabilities of such a country, therefore, under the hand of British industry, it is quite impossible to form a fair estimate at present. A deep and fertile soil appears to reward the long culture of some of the most unpromising spots. Such, at any rate, is the character of the land stretching from Cape Town to the east, or between the most southern mountains and the shore.

Different portions of the colony are very differently affected by the heats of summer; and in the Table Valley an epitome of all the varieties may be said to be found. One of the British officers, who was stationed there during our former possession of the Cape, 'declared,' says Mr. Barrow, 'that those who lived in it were either in an oven, or at the funnel of a pair of bellows, or under a water spout.' There is a difference in the summer months of from eight to ten degrees, of Fahrenheit's scale, between the temperature of Cape Town and Wynberg, at the distance only of about eight miles, from the circumstance of the latter lying to the windward of the Table Mountain and the former to leeward of it. The summer is not oppressive to Englishmen in its general temperature at the Cape, and during the months of July, August, and September,(answering, as we have seen, to our winter months), all the European settlers are glad, as a home, of a constant fire. The characteristic indications of the approach of winter at the Cape are the withdrawing of the silvery cloud from the head of the Table Mountain, and the gradual change of the winds from south-east to north-west. A raw and cold feel first accompanies the latter, which gradually heighten into perfect hurricanes, and storms of thunder and lightning, which continue for several days. When the weather clears, the mountains east and north are seen to be covered with snow, and the head of the venerable Table to have exchanged its fleecy garb for a thin covering of snow or ice. The British soldiers were so remarkably healthy, during our first occupation of the place, that in the regimental hospitals of 5000 troops not more than 100 men were entered during several months (and with complaints brought on from the sort of excesses in which the natives indulge), while the general hospital had not one sick man. There is hardly a finer spot, indeed, in the dominions of Great Britain, as we shall see in the sequel of this account, for the seasoning of troops for a warm climate. Eastward of the colony, the Caffres, who are inured to exertion from their childhood, present as fine a race of men, generally reaching six feet high, robust and muscular, as are to be found on any portion of the globe.

In almost every part of the isthmus that connects the Cape Peninsula with the continent, fresh water rises at the depth of ten or twelve feet. At Wynberg, eight miles from Cape Town, a rill of water was recently discovered in boring at about twenty feet below the surface of the ground; and when some workmen were pricking for coal in the Tiger Hills, at an elevation of twenty feet, a copious stream of water, according to the above author, was collected in the level in the month of February, the dryest season of the year.

The profitable productions of the colony, taken as a whole, are wine, grain, all the European and most of the tropical fruits, vegetables of every description, cattle and sheep. At the foot of the Table Mountain are considerable plantations of the protea argentea, or silver tree (a species of the protea peculiar to this spot), the stone pine, and the white poplar. Avenues of oak adorn the country houses, and this tree grows rapidly throughout the colony, but rarely to any perfection as timber. It is constantly cut down, with the rest of the few forest trees of the Cape, for fuel, an article very scarce here, and which seems to have been very intemperately supplied from the plantations of late years, without any provision for a succession of trees. Another species of protea, the kreupel boom of the Dutch, is also planted extensively on the hills of the Cape district; its bark is used in tanning, and the branches for fire-wood, a purpose to which are devoted various other species of this tree, which grow wild throughout the Peninsula, and many heath plants that grow on the smaller hills of that neighbourhood. Most families in decent circumstances are obliged to keep a slave employed entirely in the collection of this latter article.

Lord Macartney directed various efforts to be made during the period of his government, in search for fossil coal; and the operations in the neighbourhood of Table Bay were not wholly unsuccessful, when they were suspended by the discovery of a stratum of coally matter along the banks of a deep rivulet, flowing out of Tygerberg Hill, on the east of the isthmus which joins the Cape Peninsula to the continent. It ran horizontally, from ten inches to two feet in width over a bed of indurated clay, and was surrounded by strata of pipe-clay and white sandstone. The main bed does not appear to have been found; but large ligneous blocks were dug out in some places; in others the lithanthrax of naturalists, a turfy sort of coal, appeared, similar to the Bovey coal of England. The ligneous blocks burnt with a clear flame, leaving white ashes; the more earthy and compact parts of the stratum not so clear, and leaving a sort of slaty caulk, with a brown crust.

On the mountains of the southern coast as we have already stated, and particularly in the neighbourhood of Plettenberg's Bay, some lofty forests are found. The trees are of quick growth and considerable size, but generally hollow in the heart and much twisted in grain; profitable timber is rarely procured from them.

Wheat, barley, and pulse, are cultivated with success throughout the Cape district, and in the valleys of Drakenstein, East Zwartland, and the Twenty-four Rivers, which appear capable of any kind of agriculture. In fruits, flowers, and elegant shrubbery, no country exceeds the Cape. The apricots, oranges, peaches, prunes, and grapes, of Europe, flourish in the greatest perfection; pomegranates, melons, apples and pears, almonds, chestnuts, walnuts and mulberries, are also plentiful. The apples and pears are rather inferior; but strawberries are found ripe all the year and a few raspberries of a superior quality. No grapes in Europe are thought superior to those of this colony.

There are some good pasture farms on the eastern side of the mountains that run northward from the Cape, and at the southern foot of the Zwartzberg, or Black Mountains. In the same direction are found whole plains of the common aloe, which forms a considerable article of traffic. Horses are the favorite speculation of the grazing farmers in this direction, however, and the rye-grass of the district appears to suit them well.

The wild animals of the Cape are the lion, rhinoceros, elephant, hippopotamus, buffalo, wolf, panther, leopard, hyæna, jackal, zebra, tiger-cat, quacha, and various tribes of antelopes. Of these the gnoo, an elegant mixture of the horse and antelope, seems peculiar to this part of Africa. His body, shoulders, and mane, resemble those of the former animal, except that the mane is rather under than upon the neck, running from the breast between the fore legs; his legs have the exquisite finish of those of the antelope; while his head resembles that of a buffalo. The flocks of antelopes have greatly receded from the coast within these few years, and are now principally confined to the eastern, or Graaff Reynet district. The lion is said to be peculiarly cowardly and treacherous here. The elephant is taken by the Hottentots by digging pits under his haunts; but the European settlers openly hunt him, as well as the rhinoceros, and kill them with fire arms. Here are also hares, and a rock-rabbit without a tail.

Ostriches, eagles, vultures, kites, pelicans, cranes, ibises, flamingos, and spoon-bills, with wild ducks, geese, teal, snipes, and partridges, abound in the colony; together with a vast variety of the smaller birds of most beautiful plumage. The markets are well supplied with fish, both from the open sea, the rivers, and the numerous inlets of the coast. Bream, perch, soles, mackerel, skate, and rock-fish, are the most common; and, of shell-fish, the oyster, crab, and muscle. Seals were once found in large quantities in the islets of False Bay, but are considerably diminished of late years. The whale is taken in Table Bay: a company of merchants formerly associated in the town for the prosecution of a South Whale Fishery; it was a speculation, however, that did not succeed; the fish are certainly inferior to the whale of the northern seas, though Mr. Barrow is still sanguine in his expectations from a similar undertaking.

The horses most in request here are the black and grizzled breed of South America, which are elegant in appearance, and though small are very strong. Large numbers of oxen are raised in the eastern division, and the animal is much used in draught work throughout the colony. In his make he runs to waste, (as the English farmer would say) the shoulders are high, his legs unusually long, and his horns large. Mr. Barrow saw many of them with long scars in their sides, arising from the practice of cutting them with knives, as a method of urging them forward over a difficult pass; and mentions a wealthy inhabitant of the Cape who boasted that he could at any time start his team on a full gallop by only whetting his knife on the side of the waggon! 'In exhibiting this masterly experiment,' he adds, 'the effect of a constant and long perseverance

in brutality, to some of his friends, the waggon was overturned, and one of the company, unluckily not the proprietor, had his leg broken. Hottentot's Holland Kloof, a steep pass over the first range of mountains beyond the promontory of the Cape, has been the scene of many an instance of this sort of cruelty. I have heard a fellow boast that after cutting and slashing one of his oxen in the kloof till an entire piece of a foot square did not remain in his whole hide, he stabbed him to the heart; and the same person is said, at another time, to have kindled a fire under the belly of an ox, because it could not draw the waggon up the same kloof.' Goats are numerous in some parts; hogs are badly fed, and never eaten at a respectable table; and poultry is very rarely seen.

At Cape Town, is the seat of government, and a court of justice, to which the provincial courts appeal; the landrosts, or resident magistrates of the other districts, exercising a feeble authority. The Dutch system of governing this colony was found, indeed, on its conquest by our arms, to be exceedingly ill-contrived, and badly executed; but quite impossible to be suddenly changed amongst an obstinate and ignorant race of colonists. The landrosts were originally appointed for the purpose of settling disputes between the farmer and the oppressed natives; he was impowered to levy fines to a certain amount, and to collect the government and parochial imposts. His assistant council, called the hemraaden, comprised a few of the principal settlers of the neighbourhood, generally about six; and under them were placed an indefinite number of feldtwagtmeesteers, or superintendents of subdivisions of the district, who were to settle the water courses, rights to springs, &c. The boors, as they call themselves, who were the principal agents of this administration, of course, always favored their brother boors; crimes of every kind were committed with impunity, within a few miles of the Cape; and the mere inconvenience of discontinuing his personal visits to the markets of the capital was the sole punishment of the murderer, and men under sentence of outlawry for contempt of the provincial courts. Public justice, however, has of late been gradually assuming its firm British character.

About midway between False Bay and Table Bay, are the two farms mentioned by Dr. Sparrman, as producing the genuine Constantia wine, of which they yield from fifty to a hundred leaguers of 154 gallons, annually. They lie directly under the mountains, a circumstance to which the richness of the soil is, no doubt, in part to be attributed; the grapes are the muscatel; and particular care is taken in the whole process of the vineyard, to sustain the reputation of the spot, and in particular to reject all stalks and unripe fruit from the press. The whole of the farms on this part of the Peninsula yield together about 700 leaguers of wine; and green and ripe grapes, and prepared raisins, are sent in abundance from them to Cape Town. A distinct and laborious collection of the bulbous roots of the Peninsula has been thought worthy of a place in the botanic garden at Kew; but many of its elegant varieties are still said to be wanting there.

The shrubs and heath plants that diversify the hills of the Cape district, the chasms of the mountains, and every spot where a root will strike, are also almost endless in their variety; Doctor Roxburgh enumerated 130 species of the latter between the Cape, and the first range of mountains. The wax plant also grows abundantly on the sandy parts of the isthmus. In the clefts of kloofs of the mountains in this district are found the few remaining holds of the hyænas and wolves, which formerly infested even the streets of the capital, and still approach its outskirts in the night, in scent of the offal and dead cattle which are suffered to be thrown down on the public roads. The das, called by Pennant the Cape cavy, is a curious little animal, which also abounds in these caverns. Its size is about that of a rabbit; its color a light dusk; its ears are short, and it has no tail; the flesh is eaten at table. The steenbok, the Guinea antelope of Pennant, and once the most numerous of the antelope tribe in this district, is now nearly exterminated.

The inlets of South Africa abound with whales which run from fifty to sixty feet in length, and yield from six to ten tons of oil. They appear to make these bays a shelter for their young, and it is remarkable that none but females have been caught for years together. They are easier taken than in the northern seas, but, from their inferior size, the bone is not valuable. The penguin now supplies the place of the seal on the islands of False Bay. Scolopendras, scorpions, and immense black spiders, infest the Cape; but the mosquitoes are not so annoying as in most warm climates. A particular species of garden locust is, perhaps, the most formidable insect of the country: and the bite of the small sand-fly is very troublesome. Small land turtles are found in all the open parts of the peninsula; the camelion is also frequently seen, and various species of lizards. The most formidable of the snake tribe (which every where abounds, and most of which are venomous) is the cobra capella, as it is called, or hooded snake, of which the Hottentots are particularly afraid, and for which they, as well as the Dutch settlers, use a ridiculous remedy, called the slange steen, or snake stone. It is declared by those who deal in it to be a stone taken out of the head of a particular kind of serpent, and the criterion of its virtue is that, when plunged into water, it should produce bubbles on the surface. The fact is, it is a piece of ivory or firm bone, burnt round the edges into an oval shape, and the porosity of the bone constitutes its virtues, such as they are. The fascinating power of serpents over birds is uniformly asserted in this country, but their influence is not supposed to be extended to the human species.

All marriages in the colony must be performed at Cape Town; the following table contains a list of them for eight years, and the christenings and burials of the capital during the same period; giving an increase of christenings above burials of 1,416 in that time.

	Marriages.	Christenings.	Burials.

In eight years.	1449	2589	1173

To the north-east of Stellenbosch are the valleys of Great and Little Drakenstein, sheltered by lofty mountains, and well watered throughout by the river Berg and its minor streams, which unite in about the centre of them. The subdivision of Little Drakenstein is enclosed, as it were, by the larger valleys, and the two together supply full two-thirds of the wine of the Cape market. On the west of this valley is the village of Paarl, surrounded by a very fine tract of land, and distinguished by a curious mass of granite, surmounted with a number of large round stones, like the pearls of a necklace, to which it owes its name. The pearl is inaccessible on three sides, and rises about 400 feet from its base on the summit of the mountain, where it measures in circumference, according to this writer, a full mile. The sloping northern side by which it is ascended, is upwards of 1000 feet in length, and nearly covered with a species of green lichen. Towards the summit it is split by two deep clefts crossing at right angles, in which grow a number of beautiful aloes, and several cryptogamous plants. The whole side of the mountain is a perfect garden of various and beautiful plants.

In the autumn the exquisite scenery of this spot is further heightened by the presence of large numbers of a beautiful little bird called the creeper, some species of which unite the most enchanting powers of voice with their elegant attractions for the eye, and occasionally call off the attention of the traveller from every other part of the scene.

The mountains to the east of this valley are the barrier wall between the Cape, or western coast, and the interior; and there are but three passes, or kloofs, that are ever crossed by wheels. Eland's Kloof to the north, which opens into plains almost entirely uninhabited. Roode Sand Kloof opposite to Sandhana Bay, which communicates with Graaf Reynet and the north-east of the colony; and Hottentot's Holland Kloof, in the neighbourhood of False Bay, which leads from the Cape into the district of Zwellendam.

Franche Hoeck, the French Corner, occupies the south-east angle of this beautiful valley, and is not the less interesting from the recollection of the causes that brought its first settlers here, the persecutions that ensued on the revocation of the edict of Nantz. To these injured confessors of Protestantism the whole colony is indebted for the cultivation of the vine, here first introduced by them.

The division of East Zwartland and the twenty-four rivers, 'the Granaries of the Cape,' deserve particular notice. They lie to the north-west of the valley of Drakenstein, or between the Berg river west, and the great northern chain of mountains east. The wheat crops are very fine and full, and the land rich to perfect luxuriance. Rice also flourishes in the marshy grounds, and abundance of fruit; but wine is only made for domestic use. The Berg river, whose numerous streams give name to it, is an invaluable acquisition to the valley of the twenty-four rivers; and being capable, at a comparatively small expense, of a communication with Saldhana Bay, bids fair, in some future time, to open an important avenue of supplies to shipping. 'Should the bay of Saldhana,' says Mr. Barrow, 'at any future period, become the general rendezvous for shipping, these two divisions will be more valuable than all the rest of the colony.' The crops in the Zwartland district are more precarious, having a greater dependence on the quantity of rain that falls.

North of the plain of the twenty-four rivers is the Picquet Berg, which grows tobacco in large quantities, and of the best description in the colony. Here also horses, cattle, and sheep, are more cultivated than to the south, while the grain and fruit is not inferior.

The division of Olifant's or Elephant's River terminates this fruitful series of plains. This stream is navigable for small craft full twenty miles up the country; but its banks are uninhabited until it reaches this valley, which is situated between a double ridge of the mountains that run northward from the Cape.

Crossing the great chain of mountains to the east, we now have a succession of grazing farms, scattered over vast karroo plains, and producing some of the finest horses and horned cattle of the colony.

To the north-west, at the distance of five days' journey over an absolute desert, is the rich grazing country formerly inhabited by the Namaaqua Hottentots. It consists of a series of plains at the foot of the Khamies Berg mountains, which form the northern extremity of the colony, and unite with the Copper Mountains, which run an unknown course into the interior of the continent.

Among the Roggeveldt Mountains in this neighbourhood, and a little to the south, is the division of Roode Sand, or Waveren, about thirty miles in length, and seventy miles from Cape Town; on the road to which is the kloof of Roode Sand, a much frequented pass through the great chain of mountains. Here is a small rising village, with a church and comfortable parsonage. The valley is abundantly watered by streams connected with the Berg and Breed rivers, and is fruitful both in grain and wine. The Chinese bamboo flourishes in great beauty; rice, the Cape olive, and the palma Christi.

Further south, on the border of the Hex and Breede rivers, are some excellent meadows, well adapted for the growth of corn; no part of the colony is better watered. South of this is Zoek Milk, or Sweet Milk's Valley, containing the meritorious establishment of the Moravians, or Hernhuters as they were originally called, whose kind offices towards the poor oppressed aborigines of the country were never duly appreciated by the Dutch. During both the periods in which the colony has been in British possession, their influence has been much encouraged and increased. These appear, indeed, missionaries well adapted to obtain a permanent triumph in their benevolent designs. They have devoted themselves to the civilisation of the Hottentot, as the best mode of reaching both his understanding and his heart. Mr. Barrow, in his first journey, found three of their venerable ministers surrounded by 600 Hottentots, and an establishment that breathed the simplicity and meek effective zeal of their system. Their church, at the upper end of the valley, was a plain but neat edifice; their corn mill the best in the colony; and the garden of their village in the highest state of cultivation. One 'adorned' his Christianity, thus circumstanced, by acting as the smith of the establishment; another as a shoemaker, and a third as a tailor. 'They were men of the middle age,' says Mr. B., 'plain and decent in their dress; cleanly in their persons; of modest manners; meek and humble in their deportment, but intelligent and lively in conversation; zealous in the cause of the mission, but free from bigotry or enthusiasm.' . It is their habit to teach every one of their converts some useful trade. The place is now called Gnadenthal, and contains about 1300 inhabitants. There is a similar establishment at Groenekloof.

The Kamnasie mountain on the east is surrounded with a few grazing lands and woody hills, that lead down to the Lange Kloof, or Long Pass, a delightful valley between the mountains, along which runs one of the best roads in the colony. A series of rich pastures here suddenly burst upon the traveller, bordered by a profusion of heath plants, and studded with farmhouses, to the length of 150 miles; each farm being, by a regulation of the Dutch government, three miles distant from the other. At every house is a vineyard and fruitery, yielding the Persian or Muscatel grape, which is generally dried in a summary way for the Cape market; and remarkably fine oranges. The inferior and bruised grapes are thrown with the undergrowings, and with the lees or dregs of new wine, into large vessels to ferment, and from this is procured the brandewyn, an execrable cheap spirit, of the Cape. Here are also extensive plantations of tobacco.

There is but one road leading to the south of the valley called the Duyvil's Kop, or Devil's Head, which is esteemed one of the most formidable passes of the country. Sixteen oxen were yoked to each waggon of Mr. Barrow's party in passing this place, which toward the top is a complete set of stairs, or steps from stratum to stratum of the rock, some of them from three to four feet high, while the width of the road is not more than fifteen paces. Over these it was necessary to lift the waggons by main strength; and just as our traveller reached the summit, one of those remarkable changes in the weather took place which will strikingly illustrate the character of this climate. The day had been remarkably pleasant, the thermometer standing at 74°, when the whole hemisphere was suddenly overcast, and an immense sheet of black vapor approached from the south-east. Rolling up the mountain in distinct volumes, rapidly succeeding each other, it completely immersed the party at the top, and the temperature sunk to 39°. Snow had fallen on the same day (the longest in the year) near Zwellendam, and laid for some time on the mountains, unmelted. The descent on the south side is by no means difficult.

The most eastern division of this portion of the colony comprehends all the country between Plettenberg's and Camtoos Bay, and is penetrated by a range of forests running parallel with the sea coast for 150 miles, where the stately elephant, the rhinoceros, the buffalo, and the antelope, are found in their primitive herds. There is no regular road through these thickets, but many large and well watered plains have been cleared in the midst of them. We count no less than nine minor rivers in the official chart. There are also several lakes abounding with fish. Cattle and sheep are the principal productions, but there is no part of the colony more evidently capable of improvement, or indeed of any kind of agriculture. The wood of this district has never been fairly cultivated; such of it as is only fit for fuel can hardly be got to market, through the badness of the roads from the principal forests to the Cape. Were these once equal to what the demands of the Cape for fuel, and the abundance of the supplies in this neighbourhood alike seem to dictate, an unfailing source of emolument would be opened to the colonist, and a capital supplied for the working of the iron ores, and the rearing of profitable timber, to an almost indefinite quantity.

The settlement of the town of George, in this neighbourhood, is one of those circumstances that must tend to the development of these resources; it was a measure of Sir J. Cradock's government.

This and the Graaff Reynet district furnish the principal and best trees of the colony.

Of these the cyperus or cedar-hout has the recommendation of a strong turpentine smell, which preserves furniture from insects; the geel-houts run occasionally much larger, and would make an excellent substitute for fir on a variety of occasions; the hassagai-hout is an elegant wood for domestic purposes; the koeha might be recommended for superior household furniture; and the planks of the wit Essenhout for flooring of all sorts, and boat planks in particular.

Graaff Reynet District, as originally laid down, was the termination of the colony eastward; divided between about 700 families. The whole of the south of this division up to Albany has been recently called the district of Uitenhagen. It is generally speaking, a grazing district, but grows upwards of 10,000 muids of good corn annually; and about half the quantity of barley. See ALBANY. The inhabitants of this colony may be considered as divided into six very distinct classes of human beings; including, perhaps, as great a variety of human character as could be found upon any equal space of the earth's surface. 1. The native, or Hottento tribes. See HOTTENTOTS. 2. The slave population. 3. The vine growers. 4. The grain farmers. 5. The graziers; and 6. The town's people of the cape.

The slave population Mr. Barrow describes as better fed and clothed than any of the peasantry of Europe: the domestic slaves at Cape Town live a wretchedly idle life. Every child amongst the richer inhabitants has its attendant of this description; and to humor its caprices is amongst their most important employments. Twenty or thirty of them, in other establishments, will be engaged to do the work of six good English servants. The education of children is also, in many cases, wholly left to the most clever of them. The aspiring temper of this part of the population was decidedly indicated at that period of the French revolution which was fatal to the independence of Holland. Just at the crisis of the arrival of the British forces in 1795, the slaves had their regular meetings, and discussions upon the prevailing doctrines of the day, and were even becoming bold enough to hint to their mistresses, 'We carry you now; but by-and-by it will be our turn.' The whole system, in fact, is a disgrace and an incumbrance to the colony.

The vine growers, or wine boors as they are called at the Cape, are the most opulent cultivators of the soil of this colony. Their lands are chiefly freehold, exempt from almost all taxes, and capable of any sort of cultivation. The size of their farms is about 120 acres, English, and the culture of the grape, with an elegant garden, generally occupies the whole. Descended from the old French families who first introduced the vine into the colony, they retain much of the suavity and communicativeness of their ancestors, and in this respect, as well as in the numerous comforts of their establishments, impress the stranger with a feeling of their respectability and of their decided superiority over their neighbours. But the French language is never heard amongst them, and a French book of any kind is rarely seen.

The produce of their vineyards is brought to market from September to the period of the new vintage in February or March, but principally in the four last months of the year. Here it is subject to a rate of three rix-dollars per legger of wine or brandy, on passing the barrier; but no duty is laid upon it at the vineyard, or when sold in the country. The only taxes to which the grower is subject are a small capitation rate towards repairing the highways leading into Cape Town, and what is called the lion and tiger money, a district rate originally levied to defray the expenses of exterminating those animals, but now devoted to the general exigencies of each division. At his farms he will rear his sheep, and his corn, perhaps, or obtain them readily in exchange for wine. Milch cows for his family, and occasionally poultry, are also among the comforts of his establishment.

The grain farmers, or corn boors, are also generally opulent, and assume the next rank in society to the wine boors. The most respectable of them live either in the Cape district, or the neighbouring parts of Stellenbosch and Drakenstein. They occupy loan farms, or such as are held by lease under government, and their parochial taxes are not more than those of the wine growers. They are a selfish and quarrelsome race. The eastern mode of treading out the corn by oxen is the substitute for threshing here. A great part of the straw is wasted; the chaff only and short straw of barley being preserved as fodder for horses. The wheat in the Cape district is fine and full in the ear, weighing from sixty to sixty-five pounds a bushel; a cargo sent to Mark-lane, on the capture of the Cape in 1795, fetched the highest price of the day.

The graziers are the lowest class of the colonists, and consist in many parts of the refuse of European society: of sailors who abandon their vessels, or deserters from the troops, who may have been stationed here, or have put in at the Cape. If they are fortunate enough to recommend themselves to a settled boor's family, and marry one of his daughters (which they frequently will), a few sheep and cattle are given them to begin the world with, and those who are steady sometimes attain considerable comforts.

The inhabitants of Cape Town are a very distinct race from most of those which we have described, and yet are intimately connected with all their pursuits. In addition to its importance as a capital, and as the chief market of redundant produce, Cape Town stands at present between the only two channels of exportation and importation, Table Bay and False Bay, and is the military key of the colony. Here, therefore, numerous agents of the boor's reside; and the koopman, or merchant, is a man of importance. While the phlegm and apathy of the Dutch character seldom appear more conspicuously than at this place, and nowhere so devoid of common industry, men of undoubted talent, intelligence, and integrity, are found at the head of this class. The mercantile advantages of Cape Town have been latterly, however, in some degree diverted to Simon's Town, a rising place, containing the naval arsenal of the colony, and about 150 neat houses on the shore of Simon's bay.

The established religion of the Cape colony is Calvinism or the reformed church; the ministers of which are a highly respected and respectable body of men, both in the town and country. All other sects are tolerated, but not directly countenanced or paid. The clergy are entitled in civil life to take place next to the president of the court of justice in town, and to the landrost in the country; and their widows are provided for for life. Education we regret to add is at a very low ebb in this capital, and throughout the colony.

The original discovery of the Cape of Good Hope is traced to Bartholomew Diaz, who with a small expedition fitted out by John II. of Portugal, five years before Columbus embarked on his first voyage, first discovered the Cape; but the weather-beaten condition of his ships, and the violence of the winds, compelled him to steer homewards, after denominating this promontory Cabo Tormentos, the Cape of Storms, or, as other writers state, Cabo dos todos Tormentos, the Cape of all Plagues. His royal master, however, directed it to be called The Cape of Good Hope; and is said to have deprived himself of sleep, to form plans for availing himself of its

advantages. A second expedition was despatched to these regions in the year 1497, when, on the 20th of November, Vasco de Gama successfully doubled the Cape, and coasted the eastern shores of Africa to Melinda, in Zanguebar. The following year the Portuguese admiral, Rio D'Infante, landed in this neighbourhood on a voyage to India, and gave his own name to what is now called the Great Fish River; where shortly afterwards the court of Portugal attempted to form a settlement. In 1500 the viceroy of Brasil, Francisco D'Almeyda, putting in here for provisions was repulsed; and, on attempting to head a reinforcement, was mortally wounded by a poisoned arrow. The revenge taken by his countrymen three years after, began the series of injuries which the tribes of this country have received from Europeans. A large piece of brass ordnance, loaded with missiles, was landed as a present to the natives, who had shown themselves extremely fond of brass, and they were drawing it by ropes ashore, when it was barbarously fired amongst the crowd, and made a dreadful slaughter. After this we hear no more of the Portuguese at the Cape, except as visiting it, in common with other nations trading to the east.

At the beginning of the seventeenth century, the Dutch East India Company turned their attention to the Cape as a permanent possession, and built a fort for their protection when there. Every ship bound to the east was provided with a stone on which her name and that of each of her principal officers were engraved; to these they were to add the date at which she touched at the Cape; and burying it in a particular spot with a tin box underneath, containing letters for Holland, the returning ships sought for it, and carried them home. The English afterwards adopted the same custom.

In 1620 Andrew Shilling and Humphrey Fitzherbert, commanders of vessels bound to the East Indies, hearing that the Dutch intended to establish a colony at the Cape in the following year, planted the British standard here, and took possession of it in the name of 'James, king of England,' because they 'thought it better that the Dutch or any other nation whatever should be his majesty's subjects in this place, than that his subjects should be subject to any other.' This sentiment seems to have been supported in no particular way by the government at home. In 1650 Van Riebeck, or Roebeck, a surgeon of a Dutch Indiaman, was equipped with every necessary for the settlement of himself and 100 followers, and appointed admiral and governor in chief at the Cape. He offered the natives a quantity of brass beads, toys, brandy and tobacco, worth 50,000 guilders, it is said, for the delivery of a certain portion of land which has since become the site of Cape Town. Women and more cautious adventurers now joined them from home, and we soon find them penetrating to the Salt River.

From 1659 to 1661 the new settlers were much annoyed by wars with the native tribes. At last, the native chiefs agreed to confirm to the Dutch three leagues of land round the fort, on condition that they should claim no more. And this is the only public attempt that seems to have been made against this colony by the Hottentots, during the whole period of its history.

Stellenbosch district was planted about the year 1609 by Governor Simon Vander Stel, who gave it his name, according to the authors of the Universal History; *i. e.* Stel—and Bosch or Bush, from the abundance of the shrubs in the neighbourhood. Some modern travellers suppose it to be derived from the stenbok, or antelope, which once abounded here. The same governor first organised a militia, and military board, for the defence of the colony. The vineyards of Constantia, also, were enclosed and settled by this spirited governor, and named after his wife, a lady who is honored by one remaining statue to her memory over the door of the mansion, and another over the cellar-door of the establishment. Simon's Bay and Valley appear likewise to owe their names to him.

The colony was for a long time subject to the governor of Batavia, through whom all the orders of the home government were sent; and it was directed that no two farms in the country should be established at less than three miles' distance from each other. No further events of importance occur in the history of the Cape, until the revolution of Holland at the close of the last century. This extended its influence to this remote settlement as early as 1795; and the British government fortunately resolved to take possession of the colony for the prince of Orange, at the very period when a convention had already been established, and was about to declare it a free and independent republic. A French force had been confidently expected, and the first determination of the public authorities was to hold out against the British attack, and to call out the burgher cavalry, who were to perform wonders against the enemy. Some few of them answered the summons. General Sir James Craig, at the head of about 1600 men, led on the attack, and brought his guns to bear, he quickly drove the Dutch within their lines, and a very few shots from our artillery decided the contest. In the middle of the night offers of capitulation were sent to the British commander, and the whole colony passed into our hands almost as easily as it had done into those of the Dutch. It was restored in full sovereignty to the Batavian republic, in March, 1803.

On the renewal of the war with France, and its dependencies, Great Britain did not fail to consider the Cape as an important point of attack upon the enemy; and seems to have awoke to the determination of holding it permanently. A well-appointed force of 5000 men, under Sir David Baird and Sir Home Popham, appeared before the town in January 1806, and were received by about equal numbers, under the command of the same governor to whom we had relinquished the colony. The two armies met in the plain at the foot of Table Mountain. The Highland brigade, under general Ferguson, led the attack, and the enemy retreated through a neighbouring defile to the mountains, when honorable terms were proposed, and agreed upon, for the cession of the place to the British troops. At the peace of Paris it was definitely recognised as a colony of Great Britain. See Barrow's

Travels in Southern Africa; Vaillant, Lichtenstein, and Campbell's Travels; and the Interesting Journal of the Rev. Mr. Latrobe's Visit to South Africa in 1815 *and* 1816.

CAPEL (Arthur, lord), a devoted and truly noble adherent of Charles I. was the son of Sir Henry Capel, Knt. on whose death he succeeded to the fortunes of his family. In 1640 he represented the county of Hertford in parliament, and voted in the first instance against the king's measures, and for the attainder of Stafford. Finding, however, the extravagance of the views of his party, he had the intrepidity to abandon it, and was soon advanced by Charles to the peerage by the title of lord Capel, of Hadham. He defended Colchester in 1649, against the parliamentary forces, but, being obliged to surrender to Fairfax, he was committed to the Tower, and, although at first he made his escape, being retaken, he was beheaded March 9th, 1649. Clarendon says he was a man in whom the malice of his enemies could find no fault, and that his friends might be well content with Cromwell's character of him.

CAPEL (Arthur), his son, was created earl of Essex at the Restoration, and employed as ambassador to Denmark. In 1679 he became, for a few months, first lord of the treasury. But, being accused of being concerned in the ryehouse plot, he was committed to the Tower in 1683. He was found a few days afterwards with his throat cut.

CAPELL (Edward), a celebrated dramatic critic, was born in Suffolk, and educated at Bury. The duke of Grafton bestowed on him the office of deputy inspector of plays, to which a salary is annexed of £200 a year. In 1745 he first projected an edition of Shakspeare, of the strictest accuracy, to be collated and published, in due time, ex fide codicum. He immediately proceeded to collect and compare the oldest and scarcest copies; noting the original excellencies and defects of the rarest quartos, and distinguishing the improvements or variations of the first, second, and third folios; and, after many years' labor, produced a very beautiful small octavo, in ten volumes, with an Introduction. In 1763 he published three large volumes in quarto, entitled Notes and Various Readings of Shakspeare; together with the School of Shakspeare, or Extracts from divers English books, that were in print in the Author's time; evidently showing from whence his several Fables were taken, and some parcel of his Dialogue. Also farther Extracts, which contribute to a due understanding of his Writings, or give a light to the History of his Life, or to the Dramatic History of his Time. Mr. Capell was also the editor of a volume of ancient poems, called Prolusions; and the Alteration of Antony and Cleopatra, as acted at Drury Lane, in 1758. He died January 24th, 1781.

CAPELLA, in astronomy, a bright fixed star in the left shoulder of the constellation Auriga.

CAPELLO (Bianca), a Venetian lady, of respectable family, and duchess of Tuscany, in the sixteenth century. Her father, Bart. Capello, a patrician of Venice, discountenancing an intrigue into which she fell in early life, she left her native city in company with her paramour, Bonaventure. She was pregnant, and the lovers married at Florence. Here the uncommon beauty of her person soon attracted the attentions of Francis, son of Cosmo de Medici, the reigning duke of Tuscany; the husband consenting to his own dishonor, was advanced; and he being assassinated in the course of a new intrigue, Bianca became the avowed mistress of Francis. She is said at this time to have feigned a second pregnancy, and to have imposed the purchased child of some poor parents on her admirer as his own son. Ultimately, on the death of the wife of Francis, and his accession to the ducal throne, she induced the republic of Venice to acknowledge her as 'a daughter of the state,' and was publicly married, and installed duchess of Tuscany in 1579. This elevated station she occupied nearly nine years, to the great disgust of the other members of the Medicean family, and died within two days of her husband (not without the suspicion of both being poisoned), in October, 1587. His successor would not suffer her remains to be buried in the family vault, and procured the illegitimacy of her child to be publicly recorded.

CAPELLUS (Lewis), an eminent French Protestant divine, born at Sedan about 1579. He was author of some learned works; but is chiefly known from the controversy he engaged in with the younger Buxtorf, concerning the antiquity of the Hebrew points, which Capellus undertook to disprove. His Critica Sacra was also an elaborate work, and excited some disputes. He died in 1658, having made an abridgement of his life in his work De gente Capellorum. He was also the author of Historia Illustrata; Templi Hierosolymetani Delineatio Triplex; De Critica Nuper se Edita; Ad Novem Davidis Lyram Animadversiones; Cronologia Sacra; Diatriba de Verio et Antiquis Ebræorum Literis; Spicilegium Post Messem.

CA'PER, *v.* & *n.*
CA'PERER, *n.*
CA'PER-CUTTING, *n.*
} Fr. *capriole*; Ital. *capriola*; from the Lat. *caper*, a goat. A leap; a jump; a skip. The verb is expressive of dancing sportively; skipping merrily; 'like the leaping and springing up of goates, when they leape and play,' says Minsheu. It is also used as a contemptuous designation of dancing; as is the word caperer for a dancer. To cut a caper is to leap up with a dance-like motion. The Italians have an equivalent phrase, *tagliar le capriole*, which is translated by to caper, to prance. A caper, Fr. *capre*; Dutch, *kapre*; was once the designation of a privateer, or pirate-ship; perhaps from the quickness and desultoriness of its motions.

> We, that are true lovers, run into strange *capers*; but as all is mortal in nature, so is all nature in love mortal in folly. *Shakspeare. As you like it.*

> The truth is, I am old in judgment; and he that will *caper* with me for a thousand marks, let him lend me the money, and have at him. *Id. Henry IV.*

> Our master
> *Capering* to eye her. *Id. Tempest.*

> His nimble hand's instinct then taught each string
> A *capering* cheerfulness, and made them sing
> To their own dance. *Crashaw.*

native city in company with her paramour,

le, which is translated by to caper, to prance.
aper, Fr. *capre*; Dutch, *kapre*; was once the
gnation of a privateer, or pirate-ship; per-
s from the quickness and desultoriness of its
ions.

e, that are true lovers, run into strange capers,
as all is mortal in nature, so is all nature in love
tal in folly. *Shakspeare. As you like it.*

he truth is, I am old in judgment; and he that
caper with me for a thousand marks, let him lend
he money, and have at him. *Id. Henry IV.*

Our master *Id. Tempest.*
Capering to eye her.

His nimble hand's instinct then taught each string
capering cheerfulness, and made them sing
their own dance. *Crashaw.*

We that are true lovers, run into strange *capers*; but as all is mortal in nature, so is all nature in love mortal in folly.

Shakspeare. As you like it.

The tumbler's gambols some delight afford;
No less the nimble *caperer* on the cord:
But these are still insipid stuff to thee,
Cooped in a ship, and tossed upon the sea.
Dryden's Juvenal.

Flimnap, the treasurer, is allowed to cut a *caper*, on the strait rope, at least an inch higher than any other lord in the whole empire. *Swift's Gulliver.*

The family tript it about, and *capered* like hail stones bounding from a marble floor. *Arbuthnot's John Bull.*

The stage would need no force, nor song, nor dance,
Nor *capering* monsieur from active France. *Rowe.*

Ca'per, *n.* } Fr. *capre*, Lat. *capparis*; Ca'per-bush, } Κάππαρις. An acid pickle, made of the flower-buds of a shrub. The word is always used in the plural, except when it forms a compound with another word, as in caper-sauce. See Capparis.

We invent new sauces and pickles, which resemble the animal ferment in taste and virtue, as mangoes, olives, and *capers*. *Floyer.*

Caper, in shipping, a vessel used by the Dutch for cruising and taking vessels from the enemy; in which sense, caper amounts to the same with privateer. Capers are commonly double officered, and crowded with hands even beyond the rates of ships of war, because the thing chiefly in view is boarding the enemies.

Caper Bean. See Zygophyllum.

CAPERNAUM, a city celebrated in the gospels, being the place where Jesus usually resided during the time of his ministry. This city is no where mentioned in the Old Testament under this or any other name; and therefore it is probable that it was built after the return from the Babylonish captivity. It stood on the coast of Galilee, in the borders of Zebulon and Nephthalim (Matt. iv. 15), and took its name from an adjacent spring, which probably was an inducement to build the town in the place where it stood. Capernaum was said by our Lord himself to be exalted unto heaven; but, because its inhabitants made no right use of the privileges they enjoyed, he denounced that it should be brought down to hell (Matt. xi. 23), which has certainly been verified: for, as Dr. Wells observes, so far is it from being the metropolis of all Galilee, as it once was, that it consisted long ago of no more than six poor cottages.

CAPEROLANS, a congregation of religious in Italy, so called from Peter Caperole, their founder, in the fifteenth century. The Milanese and Venetians being at war, the enmity occasioned thereby spread itself to the very cloisters. The superiors of minor brothers, of the province of Milan, which extended itself as far as the territories of the republic of Venice, carried it so haughtily over the Venetians, that those of the convent of Brescia resolved to shake off a yoke which was grown insupportable to them. The superiors, informed of this, expelled the principal authors of this design; viz. Peter Caperole, Matthew de Thareillo, and Bonaventure of Brescia. Peter Caperole, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan. This occasioned a law-suit between the vicar general and these convents, which was determined in favor of the latter; and in 1475, by the authority of Pope Sixtus IV. they were erected into a distinct vicariate, under the title of that of Brescia. This not satisfying the ambition of Caperole, he obtained, by the interposition of the Doge of Venice, that this vicariate might be erected into a congregation; called from him Caperolans.

CAPH, a Jewish measure of capacity for things, estimated by Kimchi at the thirtieth part of the log, by Arbuthnot at the sixteenth part of the hin, or thirty-second of the seah, amounting to ⅝ of an English pint. It does not occur in Scripture as the name of any measure.

CAPHAR, a duty which the Turks exact from the Christians who carry or send merchandises from Aleppo to Jerusalem and other places in Syria. This duty was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes, to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favoring their excursions and plunders.

CAPI-AGA, or Capi-Agassi, a Turkish officer, governor of the gates of the seraglio, or grand master of the seraglio. He enjoys the first dignity among the white eunuchs: he is always near the person of the grand seignior: he introduces ambassadors to their audience: nobody enters or goes out of the grand seignior's apartment but by his means. He has the privilege of wearing the turban in the seraglio, and of going everywhere on horseback. He accompanies the grand seignior to the apartment of the sultanas, but stops at the door without entering. The grand seignior bears the expense of his table, and allows him at the rate of about fifty shillings per day: but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge without passing through his hand. He cannot be bashaw when he quits his post.

CAPIAS. A writ of two sorts, one before judgment, called capias ad respondendum, in an action personal, if the sheriff, upon the first writ of distress, return that he has no effects in his jurisdiction. The other is a writ of execution after judgment.

Capias ad Respondendum is where an original is issued out, to take the defendant, and make him answer the plaintiff.

Capias, after judgment, is of divers kinds, such as,

Capias ad Satisfaciendum, a writ of execution that issues on a judgment obtained, and lies where any person recovers in a personal action, as for debt, damages, &c. in which cases this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered, who is to be kept in prison till he make satisfaction.

Capias in Withernam, a writ that lies for cattle in Withernam: that is, where a distress taken is driven out of the country, so that the sheriff cannot make deliverance upon a replevin; then this writ issues, commanding the sheriff to take as many beasts of the distrainer, &c.

Capias pro Fine is a writ lying where a person is fined to the king, for some offence committed against a statute, and he does not discharge the fine according to the judgment; therefore his body shall be taken by this writ, and committed to gaol till the fine is paid.

Capias ut Legatum, a writ which lies against any one outlawed, upon any action personal or criminal, by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of his return, when he is to present him to the court, to be there farther ordered for his contempt.

CAPIGI, Turk. i. e. gate, a door-keeper of the Turkish seraglio. There are about 500 capigis in the seraglio, divided into two companies; one consisting of 300, under a chief called Capigi-bassa, who has a stipend of three ducats per day; the other consists of 200, called Cuccicapigi, and their chief Cuccicapigi-bassa, who has two ducats. The capigis have from seven to fifteen aspers per day. Their business is to assist the janissaries in the guard of the first and second gates of the seraglio; sometimes all together, as when the Turk holds a general council, receives an ambassador, or goes to the mosque; and sometimes only in part, being ranged on either side to prevent people entering with arms, tumults being made, &c.

CAPILLA'CEOUS, *adj.*
Capil'lament, *n.*
Capil'lary, *n.* & *adj.*
Capilla'tion, *n.*
Capil'lature, *n.*

Lat. *capillus*, quasi *capitis pilus*, from πιλος Hairy; hair-like; in delicate filaments. Capillary is most commonly applied to the fibres of plants, and the minute vessels of bodies. Mineralogists also apply it to ores which shoot out thread-like branches. Capillaceous is the same with capillary, when the latter is used as an adjective. Capillation is obsolete. Capillature, Bailey defines to be, a bush of hair, a frizzling of the hair. This word also is disused.

> Our common hyssop is not the least of vegetables, nor observed to grow upon walls; but rather, some kind of *capillaries*, which are very small plants, and only grow upon walls and stony places.
>
> *Brown's Vulgar Errours.*

> Nor is the humour contained in smaller veins, or obscure *capillations*, but in a vesicle. *Id.*

> Ten *capillary* arteries in some parts of the body, as in the brain, are not equal to one hair; and the smallest lymphatic vessels are an hundred times smaller than the smallest *capillary* artery.
>
> *Arbuthnot on Aliments.*

> *Capillary* or *capillaceous* plants, are such as have no main stalk or stem, but grow to the ground, as hairs on the head; and which bear their seeds in little tufts or protuberances on the backside of their leaves.
>
> *Quincy.*

> Those small threads, or hairs, which grow up in the middle of a flower, and adorned with little knobs at the top, are called *capillaments*. *Id.*

CAPILLAIRE, *n.* Fr. Genuine capillaire is a syrup of adiantum but in this country it is frequently made of water, orange flower water, eggs and sugar. A few spoonsful of it in water, either with or without the addition of orgeat, makes a pleasant beverage.

Capillaments in a general sense, signifies a hair; whence the word is applied to several things, which on account of their length or their fineness resemble hairs: as,

Capillaments of the Nerves, in anatomy, the fine fibres or filaments whereof the nerves are composed.

CAPILLARIS, or **Capillata, Arbor**, an ancient tree at Rome, on which the vestal virgins, when shaven for their office, hung up their hair, and consecrated it to the gods.

Capillary Tubes. See **Tubes, Capillary.**

CAPILLUS Veneris. See **Adiantum.**

CAPISCHOLUS, or **Capiscolus**, in ecclesiastical writers, denotes an officer in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called chanter or precentor. The word is also written cabiscolus, and caput-scholæ, q. d. the head of the school, or band of music. The office is also called scolasticus, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPITA, Distribution by, in law, signifies the appointing to every man an equal share of a personal estate; when all the claimants claim in their own rights, as in equal degrees of kindred, and not jure representationis.

Capita, Succession by, where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

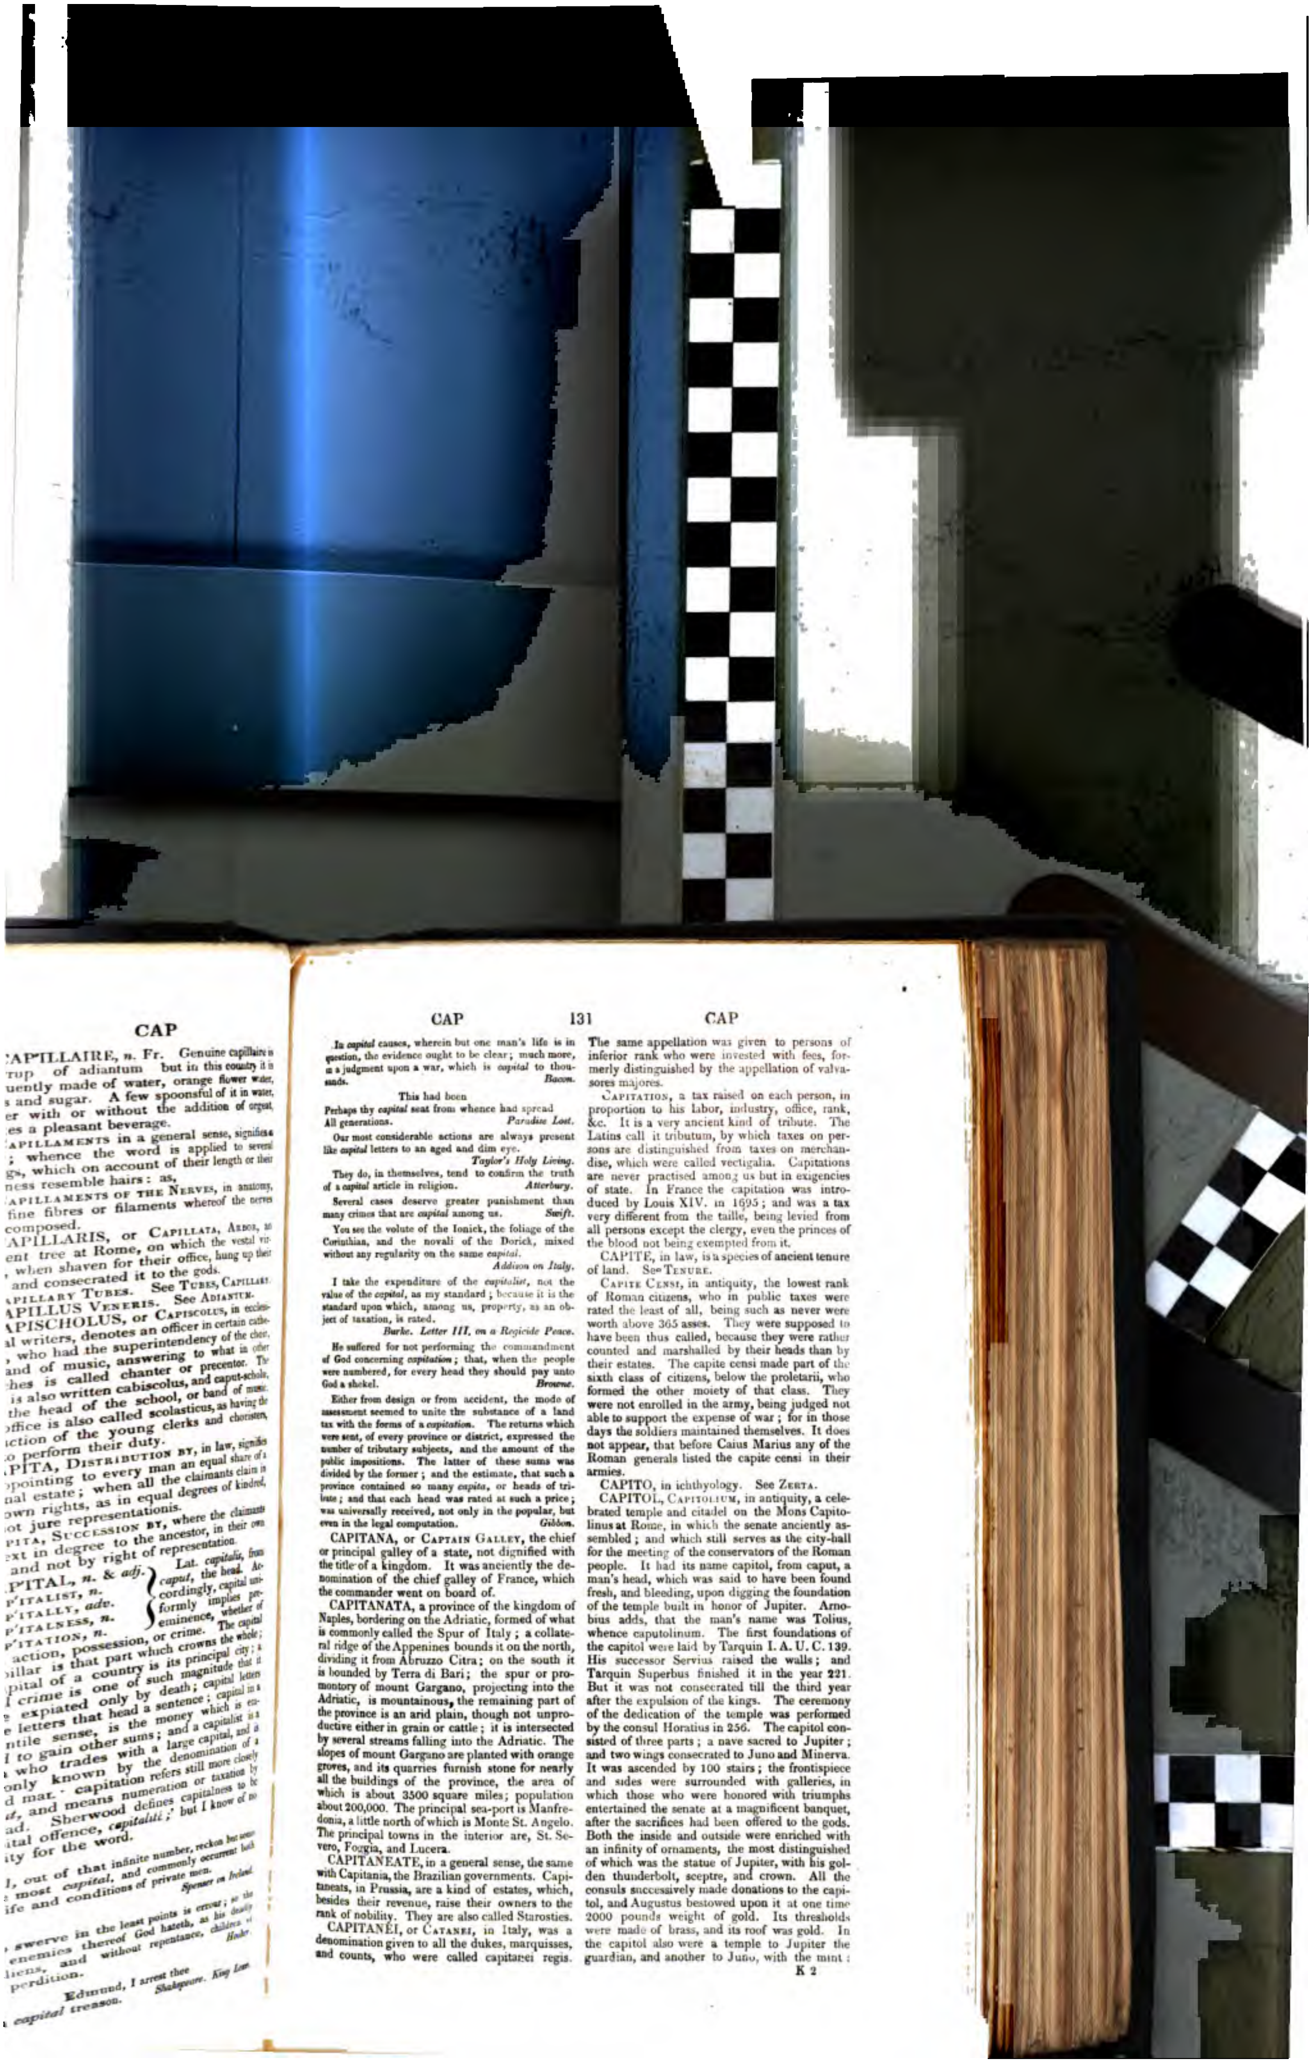
CAP'ITAL, *n.* & *adj.*
Cap'italist, *n.*
Cap'itally, *adv.*
Cap'italness, *n.*
Capita'tion, *n.*

Lat. *capitalis*, from *caput*, the head. Accordingly, capital uniformly implies pre-eminence, whether of place, action, possession, or crime. The capital of a pillar is that part which crowns the whole; the capital of a country is its principal city; a capital crime is one of such magnitude that it can be expiated only by death; capital letters are the letters that head a sentence; capital in a mercantile sense, is the money which is employed to gain other sums; and a capitalist is a person who trades with a large capital, and is commonly known by the denomination of a monied man: capitation refers still more closely to *caput*, and means numeration or taxation by the head. Sherwood defines capitalness to be 'a capital offence, *capitalité*;' but I know of no authority for the word.

> I will, out of that infinite number, reckon but some that are most *capital*, and commonly occurrent both in the life and conditions of private men.
>
> *Spenser on Ireland.*

> As to swerve in the least points is errour; so the *capital* enemies thereof God hateth, as his deadly foes, aliens, and without repentance, children of endless perdition. *Hooker.*

> Edmund, I arrest thee
> On *capital* treason. *Shakespeare. King Lear.*



:APILLAIRE, *n.* Fr. Genuine capillaire is
rup of adiantum but in this country it is
uently made of water, orange flower water,
s and sugar. A few spoonsful of it in water,
er with or without the addition of orgeat,
es a pleasant beverage.

APILLAMENTS in a general sense, signifies a
; whence the word is applied to several
gs, which on account of their length or their
ness resemble hairs: as,

APILLAMENTS OF THE NERVES, in anatomy,
fine fibres or filaments whereof the nerves
composed.

APILLARIS, or CAPILLATA, ARBOR, an
ent tree at Rome, on which the vestal vir-
, when shaven for their office, hung up their
and consecrated it to the gods.

APILLARY TUBES. See TUBES, CAPILLARY.

APILLUS VENERIS. See ADIANTUM.

APISCHOLUS, or CAPISCOLUS, in eccles-
al writers, denotes an officer in certain cathe-
, who had the superintendency of the choir,
and of music, answering to what in other
hes is called chanter or precentor. The
is also written cabiscolus, and caput-scholæ,
the head of the school, or band of music.
office is also called scolasticus, as having the
ction of the young clerks and choristers,
o perform their duty.

PITA, DISTRIBUTION BY, in law, signifies
pointing to every man an equal share of a
nal estate; when all the claimants claim in
own rights, as in equal degrees of kindred,
ot jure representationis.

PITA, SUCCESSION BY, where the claimants
ext in degree to the ancestor, in their own
and not by right of representation.

PITAL, *n.* & *adj.*
P'ITALIST, *n.*
P'ITALLY, *adv.*
P'ITALNESS, *n.*
P'ITATION, *n.*

Lat. *capitalis*, from *caput*, the head. Accordingly, capital uniformly implies pre-eminence, whether of
action, possession, or crime. The capital
illar is that part which crowns the whole;
pital of a country is its principal city; a
l crime is one of such magnitude that it
e expiated only by death; capital letters
e letters that head a sentence; capital in a
ntile sense, is the money which is em-
l to gain other sums; and a capitalist is a
who trades with a large capital, and a
only known by the denomination of a
d man. capitation refers still more closely
t, and means numeration or taxation by
ad. Sherwood defines capitalness to be
ital offence, *capitalité*;' but I know of no
ity for the word.

l, out of that infinite number, reckon but some
most *capital*, and commonly occurrent both
ife and conditions of private men.
Spenser on Ireland.

swerve in the least points is errour; so the
enemies thereof God hateth, as his deadly
liens, and without repentance, children of
perdition. *Hooker.*

Edmund, I arrest thee
a *capital* treason. *Shakspeare. King Lear.*

In *capital* causes, wherein but one man's life is in question, the evidence ought to be clear; much more, in a judgment upon a war, which is *capital* to thousands. *Bacon.*

This had been
Perhaps thy *capital* seat from whence had spread
All generations. *Paradise Lost.*

Our most considerable actions are always present like *capital* letters to an aged and dim eye.
Taylor's Holy Living.

They do, in themselves, tend to confirm the truth of a *capital* article in religion. *Atterbury.*

Several cases deserve greater punishment than many crimes that are *capital* among us. *Swift.*

You see the volute of the Ionick, the foliage of the Corinthian, and the novali of the Dorick, mixed without any regularity on the same *capital*.
Addison on Italy.

I take the expenditure of the *capitalist*, not the value of the *capital*, as my standard; because it is the standard upon which, among us, property, as an object of taxation, is rated.
Burke. Letter III, on a Regicide Peace.

He suffered for not performing the commandment of God concerning *capitation*; that, when the people were numbered, for every head they should pay unto God a shekel. *Browne.*

Either from design or from accident, the mode of assessment seemed to unite the substance of a land tax with the forms of a *capitation*. The returns which were sent, of every province or district, expressed the number of tributary subjects, and the amount of the public impositions. The latter of these sums was divided by the former; and the estimate, that such a province contained so many *capita*, or heads of tribute; and that each head was rated at such a price; was universally received, not only in the popular, but even in the legal computation. *Gibbon.*

CAPITANA, or CAPTAIN GALLEY, the chief or principal galley of a state, not dignified with the title of a kingdom. It was anciently the denomination of the chief galley of France, which the commander went on board of.

CAPITANATA, a province of the kingdom of Naples, bordering on the Adriatic, formed of what is commonly called the Spur of Italy; a collateral ridge of the Appenines bounds it on the north, dividing it from Abruzzo Citra; on the south it is bounded by Terra di Bari; the spur or promontory of mount Gargano, projecting into the Adriatic, is mountainous, the remaining part of the province is an arid plain, though not unproductive either in grain or cattle; it is intersected by several streams falling into the Adriatic. The slopes of mount Gargano are planted with orange groves, and its quarries furnish stone for nearly all the buildings of the province, the area of which is about 3500 square miles; population about 200,000. The principal sea-port is Manfredonia, a little north of which is Monte St. Angelo. The principal towns in the interior are, St. Severo, Foggia, and Lucera.

CAPITANEATE, in a general sense, the same with Capitania, the Brazilian governments. Capitaneats, in Prussia, are a kind of estates, which, besides their revenue, raise their owners to the rank of nobility. They are also called Starosties.

CAPITANEI, or CATANEI, in Italy, was a denomination given to all the dukes, marquisses, and counts, who were called capitanei regis. The same appellation was given to persons of inferior rank who were invested with fees, formerly distinguished by the appellation of valvasores majores.

CAPITATION, a tax raised on each person, in proportion to his labor, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it tributum, by which taxes on persons are distinguished from taxes on merchandise, which were called vectigalia. Capitations are never practised among us but in exigencies of state. In France the capitation was introduced by Louis XIV. in 1695; and was a tax very different from the taille, being levied from all persons except the clergy, even the princes of the blood not being exempted from it.

CAPITE, in law, is a species of ancient tenure of land. See TENURE.

CAPITE CENSI, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 365 asses. They were supposed to have been thus called, because they were rather counted and marshalled by their heads than by their estates. The capite censi made part of the sixth class of citizens, below the proletarii, who formed the other moiety of that class. They were not enrolled in the army, being judged not able to support the expense of war; for in those days the soldiers maintained themselves. It does not appear, that before Caius Marius any of the Roman generals listed the capite censi in their armies.

CAPITO, in ichthyology. See ZERTA.

CAPITOL, CAPITOLIUM, in antiquity, a celebrated temple and citadel on the Mons Capitolinus at Rome, in which the senate anciently assembled; and which still serves as the city-hall for the meeting of the conservators of the Roman people. It had its name capitol, from caput, a man's head, which was said to have been found fresh, and bleeding, upon digging the foundation of the temple built in honor of Jupiter. Arnobius adds, that the man's name was Tolius, whence caputolinum. The first foundations of the capitol were laid by Tarquin I. A. U. C. 139. His successor Servius raised the walls; and Tarquin Superbus finished it in the year 221. But it was not consecrated till the third year after the expulsion of the kings. The ceremony of the dedication of the temple was performed by the consul Horatius in 256. The capitol consisted of three parts; a nave sacred to Jupiter; and two wings consecrated to Juno and Minerva. It was ascended by 100 stairs; the frontispiece and sides were surrounded with galleries, in which those who were honored with triumphs entertained the senate at a magnificent banquet, after the sacrifices had been offered to the gods. Both the inside and outside were enriched with an infinity of ornaments, the most distinguished of which was the statue of Jupiter, with his golden thunderbolt, sceptre, and crown. All the consuls successively made donations to the capitol, and Augustus bestowed upon it at one time 2000 pounds weight of gold. Its thresholds were made of brass, and its roof was gold. In the capitol also were a temple to Jupiter the guardian, and another to Juno, with the mint:

and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits, such as the ancylia, the books of the Sibyls, &c. The capitol was burnt during the civil war of Marius, and Sylla rebuilt it, but died before the dedication, which was performed by Q. Catulus. It was again burnt by Vitellius, and rebuilt by Vespasian. It was burnt a third time by lightning under Titus, and restored by Domitian, who spent 12,000 talents in the gilding only.

Capitol was also a name anciently applied to all the principal temples, in most of the colonies throughout the Roman Empire; as at Constantinople, Jerusalem, Carthage, Ravenna, Capua, &c.

CAPITOLINE Games, annual games instituted by Camillus, in honor of Jupiter Capitolinus, and in commemoration of the capitol not being taken by the Gauls. Plutarch tells us, that a part of the ceremony consisted in the public crier putting up the Hetrurians to sale by auction; they also took an old man, and, tying a golden bulla about his neck, exposed him to the public derision. Festus says they also dressed him in a pretexta. There was another kind of Capitoline games, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians and musicians. These last were celebrated every five years, and became so famous, that instead of calculating time by lustra, they began to count by Capitoline games, as the Greeks did by Olympiads. However, this custom was not of long continuance.

CAPITOLINI, in Roman antiquity, a college of men residing in the capitol, to whom was committed the care of the Capitoline games.

CAPITOLINUS (Mons), in the history of architecture, one of the seven hills of Rome, anciently called Saturnius as the residence of Saturn, and Tarpeius from the maid who betrayed it to the Sabines. It is believed to have been first enclosed when Romulus admitted Titus Tatius into the partnership of his throne; and then to have been decorated with a temple of Jupiter Feretrius. The thatched cottage of their first king, which crowned the Capitoline Mount, was long an object of veneration to the Romans. It is mentioned by Vitruvius in the reign of Augustus, and still later by Lactantius and Macrobius in the fourth century.

CAPITOUL, or Capitol, an appellation given formerly to the chief magistrates of Toulouse, who had the administration of justice and policy in the city. They were much the same with the consuls, bailiffs, burgo-masters, mayors, and aldermen, &c. in other cities. In ancient acts they were called consules capitularii, or capitolini, and their body capitulum. They had the custody of the town-house, which was anciently called capitol. The office only lasted one year, ennobled the bearers, and entitled them to the jus imaginum, i. e. when their administration expired their pictures were hung up in the town-house.

Capitular, or Capitulary, denotes an act passed in a chapter, either of knights, canons, or religious. The capitular of Charlemagne, Charles the Bald, &c. are the laws, both ecclesiastical an civil, made by those emperors in the general assemblies of the people; which was the way in which the constitutions of most of the ancient princes were made: each person present, though a plebeian, setting his hand to them. They had their name from being divided into capitula, chapters, or sections. In these capitulars did the whole French jurisprudence anciently consist.

CAPIT'ULATE, *v.*
Capitula'tion, *n.*
Capit'ulator, *n*,
Capit'ular, *n.*
Capit'ularly, *adv.*
Capit'ulary, *adj.*
Capi'tile, *n.*

These seem to be all derived from *caput*, the head; though some would deduce the first three from *capio*. To capitulate, is to surrender; and, in the ordinary acceptation, a capitulation is the terms on which the surrender is made. Of the latter word, however, there is another use, confined to the German empire; and denoting the contract made by the emperor with the electors. In the quotation from Shakspeare, the word capitulate is defined by Johnson, 'drawing up anything in heads or articles;' but Stevens, more probably interprets it as 'making head.' Capitular signifies both a member of a chapter and the body of the statutes of a chapter; and capitularly implies convened as an ecclesiastical chapter. Wicliffe, in his bible, uses capitile in the sense of the sum, the substance, the heads.

The king took it as a great indignity, that thieves should offer to *capitulate* with him as enemies.
Hayward.

Percy, Northumberland,
The archbishop of York, Douglas, and Mortimer,
Capitulate against us, and are up.
Shakspeare. Henry IV.

It was not a complete conquest, but rather a dedition upon terms and *capitulations*, agreed between the conqueror and the conquered; wherein, usually, the yielding party secured to themselves their law and religion. *Hale.*

I still pursued, and, about two o'clock this afternoon, she thought fit to *capitulate*. *Spectator.*

The Nadhirites were more guilty, since they conspired in a friendly interview to assassinate the prophet. He besieged their castle, three miles from Medina, but their resolute defence obtained an honorable *capitulation*, and the garrison, sounding their trumpets and beating their drums, was permitted to depart with the honors of war. *Gibbon.*

That this practice continued till the time of Charlemain, appears by a constitution in his *capitular*.
Taylor.

The nuns of St. Ursula acted the wisest;—they never attempted to go to bed at all. The dean of Strasburg, the prebendaries, the *capitulars* and domiciliars (*capitularly* assembled in the morning to consider the case of buttered buns) all wished they had followed the nuns of St. Ursula's example.
Sterne. Slawkenburgius's Tale.

Canonists do agree, that the chapter makes decrees and statutes, which shall bind the chapter itself, and all its members or *capitulars*.
Ayliffe.

Capitulation, in military affairs has been used both in ancient and modern warfare, to signify a treaty made between the inhabitants of a place besieged and the besiegers, for the delivering up the place on certain conditions. The most honorable terms of capitulation are,

PITULATION, in military affairs has been
both in ancient and modern warfare, to
a treaty made between the inhabitants of a
besieged and the besiegers, for the deliver-
the place on certain conditions. The
honorable terms of capitulation are, to

march out at the breach with arms and baggage, drums beating, colors flying, a match lighted at both ends, and some pieces of cannon, waggons, and convoys for their baggage, and for their sick and wounded.

CAPITULUM, in ecclesiastical writers, denoted part of a chapter of the Bible read and explained; whence ire ad capitulum, to go to such a lecture. Afterwards the place where such exercises were performed was named domus capituli.

CAPITULUM, in the ancient military art, was a transverse beam, wherein were holes through which passed the strings, whereby the arms of huge engines, as balistæ, catapultæ, and scorpions, were played, or worked.

CAPNICON, chimney money, a tax which the eastern emperors levied for smoke, and which of consequence was due from all, even the poorest, who kept a fire. It was first exacted by Nicephorus.

CAPNOMANCY; from καπνος, smoke, and μαντεια, divination; a kind of divination by means of smoke, used by the ancients in their sacrifices. The general rule was, when the smoke was thin and light, and rose straight up, it was a good omen: if the contrary, it was an ill one. There was also a species of capnomancy, consisting in the observation of the smoke rising from poppy and jessamine seed, cast upon lighted coals.

CAPO D'ISTRIA, a town and fortress of Venetian Istria, on the east side of the gulf of Trieste. The town is seated on a small island, connected with the main land by a draw bridge and causeway, about half a mile in length. It is the see of a bishop, and has a cathedral and several other churches and religious houses; the population is about 5000, and their chief support is derived from salt and wine; the former is exported in large quantities. It is twelve miles due south of Trieste, in the latitude of 45° 4′ N. and 14° E. long.

CAPOC, in commerce, a sort of cotton so fine and so short that it cannot be spun. It is used in the East Indies to line palanquins, to make beds, mattrasses, cushions, pillows, &c.

CAPO'CHE, *v.*
CAPU'UCH, *n.*
CAPU'CH, *n.*
CAPU'CHED, *adj.*
CAPUCHI'N, *n.*

Fr. *capuce*, *capuchon*; Ital. *cappuccio*; a monk's cowl or hood; the cape of a cloak; capuchin is a female garment, consisting of a hood, and takes its name from its resemblance to the dress of the capuchin monks. Capuched signifies covered over as with a hood. Johnson declares himself unable to form a distinct idea of the meaning of the word capoched, but supposes that it may stand for stripped of the hood. May it not mean blinded them with their own hoods?

Capoched your rabbins of the synod,
And snapped their canons with a Why not?
Grave synod, men that were revered
For solid face and length of beard. *Hudibras.*

They are differently cucullated and *capuched* upon the head and back; and, in the cicada, the eyes are more prominent. *Browne's Vulgar Errours.*

He wore a little brown *capouch*, girt very near to his body with a white towel.
Shelton. Translation of Don Quixote.

CA'PON, *v.* & *n.*
CA'PONET, *n.*
CA'PONISE, *v.*
CA'PON-FASHION.

Lat. *capo*; Fr. *chapon*; Ital. *capone*; Swed. *kapun*; Dan. *capun*; Ger. *kapphan*; Dut. *kapoen*. A castrated cock. The term is also applied in ridicule to an effeminate fellow. Birch uses the verb to capon; and Daines Barrington, in his paper on singing birds, has to caponise, which is, probably of his own formation, as there appears no other authority Capon-fashion was an expression of archers, descriptive of the steel of an arrow, when it was short-breasted, and big towards the head.

And eke there was a polkat in his hawe,
That, as he sayd, his *capons* had yslawe;
And feyn he wolde him wreken, if he might,
Of vermine that destroied hem by night.
Chaucer's Canterbury Tales.

And then the justice,
Its fair round belly, with good *capon* lined.
Shakspeare. As You Like It.

Yet must he hunt his greedy landlord's hall,
With ofton presents at each festival:
With crammed *capons* every new year's morne,
Or with green cheeses when his sheep are shorne.
Hall.

All come in, the farmer and the clown;
And no one empty-hand, to salute
Thy lord and lady, though they have no suit.
Some bring a *capon*, some a rural cake,
Some nuts, some apples. *Ben Johnson.*

Muley Hamet, king of Fez and Morocco, spent three pounds on the sauce of a *capon*: it is nothing in our times: we scorn all that is cheap.
Burton. Anat. of Mel.

In good roast beef my landlord sticks his knife;
The *capon* fat delights his dainty wife.
Gay. Pastoral I.

CAPO'T, *v.* & *n.* Fr. To win all the tricks on the cards at the game of picquet.

CAPPADINE, in commerce, a sort of silk flock, taken from the upper part of the silk worm pod, after the true silk has been wound off. Slight stuffs called lassis and carbass, are made of it.

CAPPADOCIA, an ancient kingdom of Asia, comprehending all that country which lies between Mount Taurus and the Euxine Sea. It was divided by the Persians into two satrapies or governments; by the Macedonians into two kingdoms, viz.:

1. CAPPADOCIA AD PONTUM, more commonly called Pontus. See PONTUS.

2. CAPPADOCIA AD TAURUM, CAPPADOCIA MAGNA, or CAPPADOCIA properly so called, in ancient geography, a country lying between 38° and 41° N. latitude. It was bounded by Pontus on the north; Lycaonia and part of Armenia Major on the south; Galatia on the west; and by Euphrates and part of Armenia Minor on the east. The first king of Cappadocia, of whom we read, was Pharnaces, raised to the crown by Cyrus, who gave him his sister, Atossa, in marriage. He was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we only know that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests of the Macedonian monarch,

also continued in alliance with Persia. Death prevented Alexander from invading his dominions; but Perdiccas, marching against him with a powerful and well-disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him, with all those of the royal blood whom he could get into his power. Diodorus, however, says that he was killed in the battle. He is said to have reigned eighty-two years. His son Ariarathes III. having escaped the general slaughter, fled into Armenia, where he was concealed, till the dissensions among the Macedonians gave him an opportunity of recovering his kingdom. Amyntas, governor of Cappadocia, opposed him; but, being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong-holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariaramnes II. who applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by Ariarathes IV. his son, who proved a very warlike prince, and having overcome Arsaces, founder of the Parthian monarchy, considerably enlarged his dominions. His successor, Ariarathes V. married the daughter of Antiochus the Great, and entered into an alliance with that prince against the Romans; but Antiochus being defeated, Ariarathes was obliged to sue for peace, which he obtained, upon paying a fine of 2000 talents. He afterwards assisted the republic with men and money against Perseus, king of Macedon, on which account he was by the senate honored with the title of the 'friend and ally of the Roman people.' He left the kingdom in a very flourishing condition to his son Mithridates, who, on his accession, took the name of Ariarathes VI. This prince (surnamed Philopater, from the filial respect and love he showed his father from his infancy), immediately renewed the alliance with Rome. He restored Mithrobarzanes, son to Ladriades, king of the Lesser Armenia, to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia, and presented the senate of Rome with a golden crown, in acknowledgment of their assistance at this time. The senate, in return, sent him a staff and chair of ivory, which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter, king of Syria, unsuccessfully invaded his dominions, and set up a rival pretender to the throne, one Orophernes, a supposed son of the late king. The senate now decreed that Ariarathes and he should reign as partners; but next year his rival was driven out, and Ariarathes, being restored, demanded of the Priennians 400 talents of gold, which Orophernes had deposited with them. They replied, 'that, as they had been trusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name.' Upon this the king ravaged their territory with an army. The Priennians, however, though besieged by the united forces of Ariarathes and Attalus, not only made an obstinate defence, but found means to restore the money to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the siege. Ariarathes immediately obeyed, and marching his army into Assyria, joined Alexander Balas against Demetrius, who, in the very first engagement was slain, and his army entirely dispersed; Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Aristonicus, who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Crassus, proconsul of Asia, was taken, and the Roman army cut in pieces. He left six sons by his wife, Laodice, on whom the Romans bestowed Lycaonia and Cilicia. But Laodice, fearing lest her children, when they came of age, should take the government out of her hands, poisoned five of them, the youngest only having escaped her cruelty by being conveyed out of the kingdom. The monster herself was soon after put to death by her subjects. She was succeeded by Ariarathes VII. who, soon after his accession, married another Laodice, daughter of Mithridates the Great, hoping to find in that prince a powerful friend to support him against Nicomedes, king of Bithynia, who laid claim to part of Cappadocia. But Mithridates, instead of assisting, procured one Gordius to poison his son-in-law; and on his death seized the kingdom under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern it. The Cappadocians at first fancied themselves obliged to their new protector; but, finding him unwilling to resign the kingdom to the lawful heir, they rose up in arms, and driving out all his garrisons, placed Ariarathes VIII. eldest son of their deceased king, on the throne. The new prince now found himself immediately engaged in war with Nicomedes; but, being assisted by Mithridates, not only drove him out of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, Mithridates seeking for some pretence to quarrel with Ariarathes, insisted upon his recalling Gordius, who had murdered his father; which being rejected with abhorrence, a war ensued. Mithridates took the field first, in hopes of over-running Cappadocia before Ariarathes could be in a condition to make head against him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia, with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and in sight of both armies stabbed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportunity of possessing himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his prefects, soon shook off the yoke; and recalling the king's brother, who had fled into the province of Asia, proclaimed him king. He was scarcely seated on the throne, however, before Mithridates invaded the kingdom at the

d recalling the king's brother, who had fled
to the province of Asia, proclaimed him king.
e was scarcely seated on the throne, however,
fore Mithridates invaded the kingdom at the

---

head of a very numerous army, and, having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief, and Mithridates bestowed the kingdom on his own son, who was then only eight years old, giving him at the same time the name of Ariarathes X. Cappadocia passed through various struggles for and with their Roman allies, till the reign of Ariobarzanes II. who proved no less faithful to the Romans than his predecessors. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but after the death of Pompey, was received into favor by Cæsar, who bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces, king of Pontus, invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the king of Cappadocia, and honored him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put to death. He was succeeded by his brother, Ariobarzanes III. who was by Marc Antony deprived both of his kingdom and life; and in him ended the family of Ariobarzanes. Archelaus, the grandson of that general of the same name, who commanded against Sylla in the Mithridatic war, was by Marc Antony placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother, Glaphyra, a woman of great beauty, but of loose behaviour, who, in return for her compliance with the desires of Antony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Antony, he joined the latter; but, at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Trachæa, for having assisted the Romans in clearing the seas of pirates, who greatly infested the coasts of Asia. He contracted a strict friendship with Herod the Great, king of Judea, and married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate, for he had always been hated by that emperor, because, in his retirement, at Rhodes, he had paid him no sort of respect. This had proceeded from no aversion in him to Tiberius, but from the warning given Archelaus by his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been sent to compose the differences of the east, whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shown him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and hastened to Rome, where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he was accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief, or, as others say, laid violent hands on himself. He is said to have reigned fifty years. On the death of Archelaus, Cappadocia was reduced to a Roman province, and governed by those of the equestrian order. It continued subject to the Romans till the invasion of the eastern empire by the Turks, to whom it is now subject. The Turks have four Beglerbeglics in it.

CAPPANUS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships, to which it is extremely pernicious, especially in the East and West Indies; to prevent this, ships are now sheathed with copper, the first trial of which was made on his majesty's frigate the Alarm.

CAPPARIS, in botany, a genus of the monogynia order, and polyandria class of plants, natural order twenty-fifth, putamineæ: CAL. tetraphyllous and coriaceous; the petals are four, the stamina are long; the fruit is a berry, carnous, unilocular, and pedunculated. There are thirty species, of which the principal is C. spinosa, or common caper, a low shrub, generally growing out of the joints of old walls, the fissures of rocks, and among rubbish, in most of the warm parts of Europe. It has woody stalks, which send out many lateral slender branches. At the joints, between the branches, come out the flowers on long foot-stalks; before these expand, the bud, with the empalement, is gathered for pickling. Those which are left expand in form of a single rose, having five large white petals, which are roundish and concave; in the middle are placed a great number of long stamina, surrounding a style which rises above them, and crowned with an oval germen, which afterwards becomes a capsule filled with kidney-shaped seeds. This plant is very difficult to preserve in Britain; it delights to grow in crevices of rocks, old walls, &c. and always thrives best in an horizontal posture; so that, when planted either in pots or in the full ground, they seldom thrive, though they may be kept alive for some years. They are propagated by seeds in the warm parts of Europe, but very seldom in Britain. The buds, pickled with vinegar, &c. are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and assist digestion: and to be particularly useful as detergents and aperients in obstructions of the liver and spleen.

CAPPE (Newcome), a dissenting divine of the Unitarian persuasion, was born in 1732-3, at Leeds. He was placed at an early age with Dr. Aikin, at Kibworth, in Leicestershire, and afterwards with Dr. Doddridge. He went to Glasgow to complete his education in 1752, and settled ultimately as the pastor of a dissenting congregation at York. He died in 1800, having held this situation forty years. His works are: Discourses on the Providence and Government of God; Remarks in Vindication of Dr. Priestley; a Selection of Psalms for Social Worship; Critical Remarks on many important parts of Scripture, 2 vols. 8vo. &c.

CAPRA, the goat, a genus of quadrupeds belonging to the order pecora. The horns are persistent, hollow, turned upwards, erect, and scabrous. There are eight fore teeth in the under jaw, and none in the upper; and they have no dog teeth. In describing the different species and varieties of this genus, we have again to complain of that confusion of names and descriptions, which we find among zoologists, and which renders it extremely difficult to give a complete, and at the same time a distinct, arrangement of them all. Linnæus and other naturalists reckon fourteen species of this genus, under one of which, viz. the dorcas, they include most of the varieties of the antelope. Kerr reckons only eleven, some of which are by others ranked only as varieties of the common species. But both Kerr and Pennant, as well as Gmelin, Erxleben, and Pallas, make the antelope a distinct genus, forming a link between the goat (capra), and the deer (cervus), with the former of which the antelopes agree in the texture of their horns, which have a core, and in their never casting them; and with the latter, in their elegance of form. Of this genus Kerr enumerates twenty-nine species. Adhering, however, to Linnæus's classification of the whole tribe under one genus (though we by no means dispute the propriety of dividing the goats from the antelopes), the following is the most complete arrangement we can make of these animals.

I. Capra Ægagrus of Pallas and Gmelin; the cervicapra of Kæmpfer, and the Caucasan goat of Pennant and Zimmerman, has large smooth black horns, sharply ridged on their upper, and hollowed on their under surface. There are no vestiges of knots or rings, but on the upper surface are some wavy risings; they bend much back, and are much hooked at the end, approaching a little at the points. On the chin is a great beard, dusky, mixed with chestnut. The fore part of the head is black, the sides mixed with brown; the rest of the animal gray, or gray mixed with rust color. Along the middle of the back, from the neck to the tail, is a black list; and the tail is black. The female is either destitute of horns, or has very short ones. In size it is superior to the largest he-goat, but in form and agility resembles a stag. They inhabit the lower mountains of Caucasus and Taurus, all Asia Minor, and perhaps the mountains of India, and abound on the inhospitable hills of Persia. It is an animal of great agility.

II. Capra Ammon has semicircular, plain, white horns, and no beard. It is about the size of a ram, and is a native of Siberia. This animal is called the wild sheep by Mr. Pennant, and is accordingly ranked as a species of ovis by Kerr.

III. Capra Bezoartica, the bezoar goat, is bearded, and has long, wrinkled, slender, upright, tapering, sharp-pointed horns. It is a native of Persia. The bezoar is found in one of its stomachs, called abomasus. It has a red fur, with a white breast and belly; and is classed among the antelopes by Gmelin, Pallas, Pennant, &c.

IV. Capra Caucasica, the Caucasan goat, described by Kerr, as quite a different species from the Caucasan goat of Pennant. The horns, he says, are slightly triangular, knobbed on their anterior surface and arched backwards, considerably divaricating, with their extremities turned inwards. It inhabits the bare, schistic, rocky summits of mount Caucasus, near the origin of the Terek and Chouban rivers. The horns of the male are of a dirty blackish color, and much longer than those of the common goat; those of the female are brownish, and much smaller. The upper parts of the body are a bright brownish gray, with a narrow dark brown line along the back; the under parts are whitish, and the limbs black. The hair is harsh, somewhat stiff, ash-colored at the roots, and mixed with an ash-colored wool. It is about the size of a common goat, with which, however, it will not breed; and is rather shorter and broader in its general form.

V. Capra Cervicapra, the lidmee, or Indian antelope of Buffon, has long prominently annulated, tapering, plaited, cylindrical horns, and inhabits Barbary. The hair near the horns is longer than in any other part of the body. The females want horns.

VI. Capra Depressa, the African goat, has short, thick, triangular, depressed, horns, bent inwards, lying on the head. It is about the size of a kid; and the hair is long and pendulous, rough in the male, but smooth in the female. The male has also two long hairy wattles below the chin.

VII. Capra Dorcas, the antelope, has cylindrical annulated horns, bent backward, contorted, and arising from the front between the eyes. It is a native of Africa and Mexico. These animals are of a restless and timid disposition; extremely watchful; of great vivacity; remarkably swift; exceedingly agile; and their boundings so light and elastic, as to strike the spectator with astonishment. What appears singular, they will stop in the middle of their course, for a moment gaze at their pursuers, and then resume their flight. The chase of these animals is a favorite diversion in the east. The greyhound is unequal in the course; and the sportsman is obliged to call in the aid of the falcon, trained to the work, to seize on the animal, and so to impede its motions as to give the dog time to overtake it. It is a common compliment in the east; to say, 'Aine el czazel,' i. e. you have the eyes of an antelope. Some species form herds of 2000 or 3000, while others keep in small troops of five or six. They generally reside in hilly countries, and some browse like the goat. To the distinctive marks of the antelope we may add the following characteristics viz. that most of them have distinct lachrymal pits under the eyes; that all have a plait of the skin subdivided into several cells in the groins; brushes of hair on the knees, and beautiful black eyes: in general also their flesh is excellent. Kerr, who, as already observed, classes the antelope as a distinct genus, enumerates twenty-nine species; among which he ranks the Bezoartica, cervicapra, gazella, and tartarica of Linnæus.

VIII. Capra Gazella, the goat antelope of Linnæus, the antelope oryx, or Bezoartica of Pallas, the pasan of Buffon, or Egyptian ante-

says, are slightly triangular, knobbed on their
anterior surface and arched backwards, consi-
derably divaricating, with their extremities turned
inwards. It inhabits the bare, schistic, rocky
summits of mount Caucasus, near the origin of
the Terek and Chouban rivers. The horns of
the male are of a dirty blackish color, and much
longer than those of the common goat; those of
the female are brownish, and much smaller.
The upper parts of the body are a bright brown-
ish gray, with a narrow dark brown line along
the back; the under parts are whitish, and the
limbs black. The hair is harsh, somewhat stiff,
ash-colored at the roots, and mixed with an ash-
colored wool. It is about the size of a common
goat, with which, however, it will not breed;
and is rather shorter and broader in its general
form.

V. Capra Cervicapra, the lidmee, or In-
dian antelope of Buffon, has long prominently
annulated, tapering, plaited, cylindrical horns,
and inhabits Barbary. The hair near the horns
is longer than in any other part of the body.
The females want horns.

VI. Capra Depressa, the African goat, has
short, thick, triangular, depressed, horns, bent in-
wards, lying on the head. It is about the size of
a kid; and the hair is long and pendulous,
rough in the male, but smooth in the female.
The male has also two long hairy wattles be-
ow the chin.

VII. Capra Dorcas, the antelope, has cylin-
drical annulated horns, bent backward, con-
orted, and arising from the front between the
eyes. It is a native of Africa and Mexico.
These animals are of a restless and timid dis-
position; extremely watchful; of great vivacity;
remarkably swift; exceedingly agile; and their
boundings so light and elastic, as to strike the
pectator with astonishment. What appears sin-
gular, they will stop in the middle of their
course, for a moment gaze at their pursuers, and
hen resume their flight. The chase of these
nimals is a favorite diversion in the east. The
reyhound is unequal in the course; and the
portsman is obliged to call in the aid of the
alcon, trained to the work, to seize on the ani-
nal, and so to impede its motions as to give the
log time to overtake it. It is a common com-
liment in the east; to say, 'Aine el czazel,' i.e.
ou have the eyes of an antelope. Some species
orm herds of 2000 or 3000, while others keep
n small troops of five or six. They generally
eside in hilly countries, and some browse like
he goat. To the distinctive marks of the ante-
ope we may add the following characteristics
iz. that most of them have distinct lachrymal
its under the eyes; that all have a plait of the
kin subdivided into several cells in the groins;
rushes of hair on the knees, and beautiful black
yes: in general also their flesh is excellent.
err, who, as already observed, classes the an-
lope as a distinct genus, enumerates twenty-
ine species; among which he ranks the Bezoar
ca, cervicapra, gazella, and tartarica of Lin-
eus.

VIII. Capra Gazella, the goat antelope of
innæus, the antelope oryx, or Bezoartica of
allas, the pasan of Buffon, or Egyptian ante-

lope of Pennant, has straight, slender, distinctly annulated horns, three feet long, which taper to a point: the body and sides are of a reddish ash color, with a dusky line along the back. It inhabits Syria, Arabia, Persia, India, Egypt, Ethiopia, and the Cape. It is about the size of a fallow deer. Gmelin takes this for the zebi of Scripture.

IX. Capra Gnou, has scabrous horns, thick at the base, bending forward close to the head, then suddenly reverting upwards. The mouth is square; the nostrils covered with broad flaps. From the nose, half way up the front, is a thick oblong square brush of long stiff black hairs reflected upwards, on each side of which the other hairs are long, and point closely down the cheeks. Round the eyes are disposed in a radiated form several strong hairs. The neck is short, and a little arched. On the top is a strong and upright mane, reaching from the horns beyond the shoulders. On the chin is a long white beard; and on the gullet a very long pendulous bunch of hair. The legs are long, elegant, and slender, like those of a stag. On each foot is only a single spurious or hind hoof. It is a strange compound of animals; having a vast head like that of an ox, body and tail like a horse, legs like a stag, and the sinus lacrymalis of an antelope. Its ordinary size is about that of a common galloway; its length being somewhat above five, and height rather more than four feet. These animals inhabit in great numbers the fine plains of the great Namaquas, far north of the Cape of Good Hope, extending from south latitude 25° to 28° 42', where Africa seems at once to open its vast treasures of hoofed quadrupeds. The gnou is an excedingly fierce animal: on the sight of anybody it usually drops its head, and puts itself into an attitude of offence; and will dart with its horns against the pales of the enclosure towards the persons on the outside; yet it will afterwards take the bread which is offered. It will often go upon its knees, run swiftly in that singular posture, and furrow the ground with its horns and legs. The Hottentots call it gnou from its voice. It has two notes, one resembling the bellowing of an ox, the other more clear. It is called an ox by the Europeans, and is stiled accordingly bos gnou by Zimmerman.

X. Capra Hircus, the common goat, with arched carinated horns, and a long beard. It is a native of the eastern mountains. Goats are animals of more sagacity than sheep. Instead of having an antipathy to mankind, they voluntarily mingle with them, and are easily tamed. Even in uninhabited countries, they betray no savage dispositions. They have a lively, capricious, and wandering disposition; are fond of high and solitary places, and frequently sleep upon the very points of rocks. They are more easily supported than any other animal of the same size; for there is hardly a herb, or the bark of a tree, which they will not eat. Neither are they liable to so many diseases as sheep, and can bear heat and cold with less inconvenience. Goats go with young four months and a half, and bring forth from the end of February to the end of April. They have only two teats, and generally bring forth but one or two young; sometimes three, and in good warm pastures there have been instances, though rare, of their bringing forth four at a time. Both young and old are affected by the weather; a rainy season makes them thin, a dry sunny one fat and blythe. In our climate they seldom live above eleven or twelve years. Though their food costs next to nothing, their produce is valuable. The whitest wigs are made of their hair; for which purpose that of the he-goat is most in request. The Welsh goats are far superior in size, and in length and fineness of hair, to those of other mountainous countries. Their usual color is white: those of France and the Alps are short-haired, reddish, and the horns small. Bolsters, made from the hair of a goat, were in use in the days of Saul, as appears from 1 Sam. xix. 13. The species very probably was the Angora goat, whose soft and silky hair supplied a most luxurious couch. The suet of the goat is in great esteem as well as the hair. The inhabitants of Caernarvonshire suffer these animals to run wild on the rocks in winter as well as in summer; and kill them in October for the sake of their fat. The goats killed for this purpose are about four or five years old. Their suet makes candles far superior in whiteness and goodness to those made from that of the sheep or the ox, and accordingly brings a much greater price in the market; nor are the horns without their use, the country-people making of them excellent handles for tucks and penknives. The skin is peculiarly well adapted for the glove manufactory, especially that of the kid: abroad it is dressed and made into stockings, bed-ticks, bed-hangings, sheets, and even shirts. In the army it covers the horseman's arms, and carries the foot-soldier's provisions. As it takes a dye better than any other skin, it was formerly much used for hangings in the houses of people of fortune, being susceptible of the richest colors, and when flowered and ornamented with gold and silver, became an elegant and superb furniture. The flesh is of great use to the inhabitants of those countries which abound with goats; and affords them a cheap and plentiful provision in winter. The haunches are frequently salted and dried, and supply all the uses of bacon: this by the Welsh is called coch yr wden, or hung venison. The meat of a spayed goat of six or seven years old, (which is called hyfr) is reckoned the best; being generally very fat and sweet. It makes an excellent pasty; goes under the name of rock venison; and is little inferior to that of the deer. The milk is sweet, nourishing, and medicinal. It is an excellent succedaneum for ass's milk; and has, with a tea-spoonful of hartshorn, drunk warm in bed in the morning and afternoon, and repeated for some time, proved a cure for phthisis when not too far gone. In some of the mountainous parts of Scotland and Ireland, the milk is made into whey, which has done wonders in this and similar cases; and to many of those places there is as great a resort of patients of all ranks, as there is in England to the spas or baths. The milk of this animal must be salutary, as it browses only on the tops, tendrils, and flowers, of the mountain shrubs, and medidicinal herbs; rejecting the grosser parts. The blood of the he-goat, dried, was formerly reckoned a specific in pleurisies, and is even taken notice of by Dr. Mead for this purpose; but is now deservedly neglected. Cheese made of goat's milk is much valued in some of our mountainous countries, when kept to a proper age. It has a peculiar taste and flavor. There are several varieties of the common goat: such as, 1. C. hircus Angorensis, the Angora goat, a variety found only in the tract that surrounds Angora, Beibazar, and Cougna, in Asiatic Turkey, and about Gombron in Persia. 2. C. hircus capricornus, the capricorne of Buffon, has short horns, the ends turned forwards, their sides annulated, and the rings more prominent before than behind. Kerr says the place, history, and even figure, of this animal are uncertain. 3. C. hircus mutica, the cabonus goat of Pennant, is ranked by Kerr as a distinct species, although he styles it 'a variety resembling the common domestic goat in everything but the want of horns.' Perhaps this deficiency may be accidental, like that of many of the Scots oxen.

XI. Capra Ibex, the wild goat, is supposed to be the stock whence the tame species sprung. It has large knotty horns reclined upon its back, is of a yellowish color, and its beard is black. The females are less and have smaller horns, more like those of a common she-goat, and with few knobs on the upper surface: they bring forth one kid, seldom two, at a birth. They inhabit the highest Alps of the Grisons country and the Valais; they are also found in Crete, Italy, the Appenines, Germany, Siberia, and Kamtschatka. They are very wild, and difficult to be shot, as they always keep on the highest points. Their chase is exceedingly dangerous: being very strong, they often tumble the incautious huntsman down the precipices, unless he has time to lie down, and let the animals pass over him. They are said not to be long-lived. Their flesh is much esteemed, and their skins are very thin.

XII. Capra Mambrina, or Mambrica, the Syrian goat, has short reclined horns, pendent ears, and a beard. It is a native of the east. Their ears are of vast length; from one to two feet; and sometimes so troublesome, that the owners cut off one to enable the animal to feed with more ease. These animals supply Aleppo with milk. They are larger than the common goats.

XIII. 1. Capra Reversa, the buck of Juda, has short, smooth, erect horns, curved a little forwards. It is about the size of a kid of a year old. It inhabits Juda, or Widaw, in Africa. Kerr describes another variety, viz. 2. C. reversa nana, styled by Buffon, the other buck of Juda. It inhabits the same country, is likewise of dwarfish size, and, though joined with the preceding by Gmelin, is separated by Kerr, on account of the different figure of the horns; which he describes as 'very thick, rounded on the upper surface, with two sharp edges below; and bent backwards with a slight spiral twist, downwards, outwards, and upwards.'

XIV. Capra Rupicapra, the chamois goat, has smooth, erect, and crooked horns. The body is of a dusky red color; but the front, top of the head, gullet, and inside of the ears are white; the under part of the tail is blackish; and the upper lip is a little divided. It inhabits the Alps of Switzerland, Italy, and the ci-devant province of Dauphiné, the Pyrenean mountains, Greece, and Crete: does not dwell so high in the hills as the ibex, and is found in greater numbers. It is of the size of a domestic goat, and its hair is as short as that of a hind. Its vivacity is delightful, and its agility truly admirable. These animals are very social; they go in little flocks of from three to twenty; sometimes from sixty to a hundred of them are seen dispersed along the declivity of the same mountain. The large males keep at a distance from the rest, except in the rutting season, when they join the females, and beat off all the young. At this period, their ardor is still longer than that of the wild bucks. They bleat often, and run from one mountain to another. Their season of love is in the months of October and November, and they bring forth in March and April. A young female takes the male at the age of eighteen months. The females bring forth one, but rarely two, at a time. The young follow their mothers till October, if not dispersed by the hunters or the wolves. They live between twenty and thirty years. Their flesh is very good. A fat chamois goat will yield from ten to twelve pounds of suet, which is harder and better than that of the goat. The blood of the chamois is extremely hot, and is said to have qualities and virtues nearly equal to those of the wild goat. The voice of the chamois is a very low and almost imperceptible kind of bleating, resembling that of a hoarse domestic goat. By this bleating they collect together. But, when alarmed, or when they perceive an enemy, they advertise one another by a kind of whistling noise. The sight of the chamois is very penetrating, and his sense of smelling is acute. When he sees a man distinctly, he stops for some time, and flies off when he makes a nearer approach. His sense of hearing is equally acute, for he hears the smallest noise. When the wind blows in the direction of a man, he will perceive the scent at the distance of more than half a league. Hence, when he smells or hears any thing which alarms him, he whistles with such force, that the rocks and forests re-echo the sound. All his brethren that are near take the alarm. This whistling is performed through the nostrils, and consists of a strong blowing, similar to the sound which a man may make by fixing his tongue to the palate, with his teeth nearly shut, his lips open, and somewhat extended, and blowing long and with great force. The chamois is very fond of the leaves and tender buds of shrubs, particularly of the meum athamanta. Kramer, in his Hist. Nat. Aust. supposes the balls called ægagropilæ, found in his stomach, to be occasioned by this food. See Ægagropilæ. He ruminates like the common goat. His head is adorned with two small horns, from half a foot to nine inches in length. Their color is a fine black, and they are placed on the front nearly between his eyes; and, instead of being reflected backwards, like those of other animals, they advance forward above the eyes, and bend backward at the points, which are extremely sharp. He adjusts his ears most beautifully to the points of his horns. Two tufts of black hair descend

ıe under part of the tail is blackish; and the up-
er lip is a little divided. It inhabits the Alps of
witzerland, Italy, and the ci-devant province of

from his horns to the sides of his face. The rest of the head is of a yellowish white color, which never changes. The horns of the chamois are used for the heads of canes. Those of the female are smaller and less crooked. The skin of the chamois, when dressed, is very strong, nervous, and supple, and makes excellent riding breeches, gloves and vests. Garments of this kind last long, and are of great use to manufacturers. The chamois goats are so impatient of heat, that, in summer, they are only to be found under the shades of caverns in the rocks, among masses of congealed snow and ice, or in elevated forests, on the northern declivities of the most scabrous mountains, where the rays of the sun seldom penetrate. They pasture in the mornings and evenings, and seldom during the day. Their mode of climbing or descending inaccessible rocks is admirable. They neither mount nor descend perpendicularly, but in an oblique line. When descending, particularly, they throw themselves down across a rock which is nearly perpendicular, and of twenty or thirty feet in height, without having a single prop to support their feet. In doing this, they strike their feet three or four times against the rock, till they arrive at a proper resting place below. The spring of their tendons is so great, that, when leaping about among the precipices, one would imagine they had wings instead of limbs. The legs are long; those behind are somewhat longer, and always crooked, which favors their springing to a great distance; and, when they throw themselves from a height, the hind legs receive the shock, and perform the office of two springs in breaking the fall. During winter, they inhabit the lower forests, and live upon pine leaves, the buds of trees, bushes, and such green or dry herbs as they can find by scratching off the snow with their feet. The forests that delight them most, are those which are very full of rocks and precipices. The hunting of the chamois is very difficult and laborious. See HUNTING. This species is ranked among the antelopes by Messrs. Pennant, Kerr, Gmelin, &c.

XV. CAPRA TARTARICA, the saiga of Buffon, has cylindrical, straight, annulated horns; the points inclining inward, the ends smooth; the other part surrounded with very prominent annuli; of a pale yellow color, and the greatest part semipellucid; the cutting teeth are placed so loose in their sockets, as to move with the least touch. The male is covered with a rough hair like the he-goat, and has a very strong smell; the female is smoother. The hair on the sides and throat is long, and resembles wool; that on the neck and head is hoary; the back and sides of a dirty white; the breast, belly, and inside of the thighs, of a shining white. The females are destitute of horns. These animals inhabit all the deserts from the Danube and Dnieper to the River Irtish, but not beyond. Nor are they ever seen to the N. of 54° or 55° lat. They are found in Poland, Moldavia, about Mount Caucasus, the Caspian Sea, and Siberia, in the dreary open deserts, where salt springs abound, feeding on the salt, acrid, and aromatic plants of those countries, and grow in summer very fat: but their flesh acquires a taste disagreeable to many people, and is scarcely eatable, until it is suffered to grow cold after dressing. The females go with young the whole winter; and bring forth in the northern deserts in May. The young are covered with a soft fleece, like new dropped lambs, and curled and waved. They are regularly migratory. In the rutting season, late in autumn, they collect in flocks of thousands, and retire into the southern deserts. In the spring they divide into little flocks, and return northward. The male feeds promiscuously with the females and their young. They rarely lie down all at the same time; but, by a provident instinct, some are always keeping watch; and, when they are tired, they seemingly give notice to such as have taken their rest, who rise instantly, and relieve the sentinels. They thus often preserve themselves from the attack of wolves, and the surprise of the huntsmen. They are excessively swift, and will outrun the fleetest horse or greyhound; yet partly through fear (for they are the most timid of animals), and partly by the shortness of their breath, they are very soon taken. If they are bit by a dog they instantly fall down, nor will they even offer to rise. In running they seem to incline on one side. In a wild state they have no voice. When brought up tame, the young emit a short sort of bleating, like sheep. The males are very libidinous. When taken young they may easily be tamed; but, if caught at full age, they are so wild and obstinate as to refuse all food. When they die, their noses are quite flaccid. They are hunted for the sake of their flesh, horns, and skins, which are excellent for gloves, belts, &c. See HUNTING. The fat resembles that of mutton; in taste, that of a buck: the head is reckoned the most delicate part.

CAPRÆ SALTANTES, Lat. i. e. dancing goats, in meteorology, fiery meteors or exhalations, sometimes seen in the atmosphere. They form inflected lines, resembling in some measure the caperings of a goat; whence the name.

CAPRARIA, in botany, goat-weed, a genus of the angiospermia order, and didynamia class of plants; natural order fortieth, personatæ: CAL. quinquepartite: COR. campanulated, quinquefid, with acute segments: CAPS. bivalved, bilocular, and polyspermous. Species, six; the principal, C. biflora, is a native of the warm parts of America.

CAPREA, or CAPREÆ, in ancient geography, an island in the Tuscan Sea, famous for the retreat of the emperor Tiberius for seven years. See TIBERIUS. Before he came hither Capreæ had attracted the notice of Augustus, as a most eligible retreat, though almost in the centre of the empire. His successor preferred it to every other residence; and in order to vary his pleasures, and enjoy the advantages as well as avoid the inconveniences of each revolving season built twelve villas in different temperatures, and dedicated to the twelve greater gods: the ruins of some of them are still to be seen. The odium attached to the memory of Tiberius proved fatal to his favorite abode; scarcely was his death proclaimed at Rome, when the senate issued orders for the demolition of every fabric he had raised on the island, which, by way of disgrace, was thenceforward destined to be a state prison. The wife and sister of Commodus were banished to its inhospitable rocks, which were soon stained with their blood. In the middle ages Capreæ became an appendage of the Amalfitan republic, and, after the downfall of that state, fell to the duchy of Naples. There stood a pharos on this island, which, a few days before the death of Tiberius, was overthrown by an earthquake. See CAPRI.

CAP'REOLATE, *adj.* from the Lat. *capreolus*, a vine tendril.

Such plants as turn, wind, and creep along the ground, by means of tendrils, as gourds, melons, and cucumbers, are termed, in botany, *capreolate* plants. *Harris.*

CAPREOLI, in botany, the tendrils by which vines, peas, and other creeping plants, fasten themselves to anything near them. See BOTANY.

CAPREOLUS, in anatomy, the helix, or outer ambit of the ear.

CAPRI, an island at the entrance of the Gulf of Naples, anciently called Caprea, seven miles long, and two broad. A large portion of its surface is unfit for cultivation; but every spot that will admit the hoe, is industriously tilled, and richly laden with the best productions of the earth. It exhibits some relics of its ancient grandeur. Two broken columns show the entrance of Tiberius's court (see CAPREA); at Santa Maria there are extensive vaults and reservoirs; and, on an adjacent hill, the remains of a light house. The island is much frequented by quails, forming the principal revenue of the bishop, whence he is called the bishop of quails.

CAPRI, the capital of the above isle, seated on a high rock at the west end of it, twenty-seven miles from Naples. Long. 14° 8′ E., lat. 40°11′ N.

CAPRI'CE,
CAPRI'CHIO,
CAPRI'CIOUS,
CAPRI'CIOUSLY,
CAPRI'CIOUSNESS.

} Fr. *caprice*; Ital. *capriccio*; Span. *capricho*; from Lat. *caper*, a goat; allusively to the wantonness and freakishness of that animal. Serenius, on the other hand, traces caprice to the Gothic *kepra*, corrugare frontem. 'Caprichio,' says Sherwood, is 'a fantasticall humour;' and the word caprice, in the French, he defines to be a 'humour, caprichio, giddy thought, fantasticall conceit; a sudden will, desire, or purpose to do a thing, for which one hath no (apparent) reason.' This is so full and correct that it is unnecessary to add anything to it. The derivatives from the primary word need no explanation.

Will this *capricio* hold in thee, art sure?
Shakspeare. All's Well.

TOUCH. I am here with thee and thy goats as the most *capricious* poet, honest Ovid, was among the Goths.

JAQ. O knowledge ill inhabited! worse than Jove in a thatched-house!
Id. As You Like It.

Act freely, carelessly, and *capriciously*, as if our veins ran with quicksilver. *Ben Jonson.*

Capricious, wanton, bold and brutal lust,
Is meanly selfish; when resisted cruel,
And, like the blast of pestilential winds,
Taints the sweet bloom of Nature's fairest forms.
Milton's Comus.

It is a pleasant spectacle to behold the shifts, windings, and unexpected *caprichios* of distressed Nature, when pursued by a close and well-managed experiment. *Glanville. Preface to the Scepsis.*

We are not be guided in the sense of that book, either by the misreports of some ancients, or the *caprichios* of one or two neoterics. *Grew.*

Quoth Hudibras, 'tis a *caprich*
Beyond the infliction of a witch;
So cheats to play with those still aim,
That do not understand the game. *Hudibras.*

Heaven's great view is one, and that the whole;
That counterworks each folly and *caprice*,
That disappoints the effect of every vice. *Pope.*

A subject ought to suppose that there are reasons, although he be not apprised of them; otherwise, he must tax his prince of *capriciousness*, inconstancy, or ill design. *Swift.*

Love's a *capricious* power; I've known it hold,
Out, though a fever caused by its own heat,
But be much puzzled by a cough and cold,
And find a quinsy very hard to treat. *Byron.*

CAP'RICORN, *n.* Lat. *capricornus*. One of the zodiacal signs; the winter solstice.

But when the golden spring reveals the year,
And the white bird returns, whom serpents fear;
That season deem the best to plant thy vines:
Next that, is when autumnal warmth declines;
Ere heat is quite decayed, or cold begun,
Or *Capricorn* admits the winter sun.
Dryden. Georgics, b. ii.

Let the longest night in *Capricorn* be of fifteen hours, the day consequently must be of nine.
Notes to Creech's Manilius.

CAPRICORN, one of the signs of the zodiac, marked thus ♑. The ancients accounted Capricorn the tenth sign; and it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the eleventh sign; and it is at the sun's entry into Sagittarius, that the solstice happens, though the ancient manner of speaking is still retained. This sign is represented on ancient monuments, medals, &c. as having the fore part of a goat, and the hind part of a fish, which is the form of an Ægipan: sometimes simply under the form of a goat. The stars in this constellation are 0·0·3·3·9·35· in all fifty of the first six magnitudes.

CAPRICORN, TROPIC OF, a lesser circle of the sphere, which is parallel to the equinoctial, passing through the beginning of Capricorn. See ASTRONOMY.

CAPRIFICA'TION, *n.* Lat. *caprificatio*. An operation performed to ripen the fruit of the fig-tree.

The process of *caprification* being unknown to these savages, the figs come to nothing. *Bruce.*

CAPRIFICATION, a method used in the Levant, for ripening the fruit of the domestic fig tree, by means of insects bred in that of the wild fig tree. The most ample and satisfactory accounts of this curious operation in gardening are those of Tournefort and Pontedera: the former, in his Voyage to the Levant, and in a Memoir delivered to the Academy of Sciences at Paris in 1705; the latter, in his Anthologia. The caprification of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practised at this

It is a pleasant spectacle to behold the shifts, wind-
s, and unexpected *caprichios* of distressed Nature,

nt. *Glanville. Preface to the Sceps.*

Ve are not be guided in the sense of that book,
ier by the misreports of some ancients, or the *ca-*
hios of one or two neoterics. *Grew.*

Quoth Hudibras, 'tis a *caprich*
Beyond the infliction of a witch;
So cheats to play with those still aim,
That do not understand the game. *Hudibras.*

Heaven's great view is one, and that the whole;
hat counterworks each folly and *caprice*,
hat disappoints the effect of every vice. *Pope.*

subject ought to suppose that there are reasons,
ough he be not apprised of them; otherwise, he
t tax his prince of *capriciousness*, inconstancy, or ill
gn. *Swift.*

Love's a *capricious* power; I've known it hold,
at, though a fever caused by its own heat,
st be much puzzled by a cough and cold,
id find a quinsy very hard to treat. *Byron.*

AP'RICORN, *n.* Lat. *capricornus.* One of
odiacal signs; the winter solstice.

But when the golden spring reveals the year,
id the white bird returns, whom serpents fear;
at season deem the best to plant thy vines:
xt that, is when autumnal warmth declines;
heat is quite decayed, or cold begun,
Capricorn admits the winter sun.
Dryden. Georgics, b. ii.

the longest night in *Capricorn* be of fifteen hours,
y consequently must be of nine.
Notes to Creech's Manilius.

PRICORN, one of the signs of the zodiac,
d thus ♑. The ancients accounted Capri-
the tenth sign; and it made the winter
e with regard to our hemisphere: but the
aving advanced a whole sign towards the
Capricorn is now rather the eleventh sign;
is at the sun's entry into Sagittarius, that
stice happens, though the ancient manner
aking is still retained. This sign is repre-
on ancient monuments, medals, &c. as
the fore part of a goat, and the hind part
, which is the form of an Ægipan: some-
imply under the form of a goat. The
this constellation are 0·0·3·3·9·35· in all
the first six magnitudes.

RICORN, TROPIC OF, a lesser circle of the
which is parallel to the equinoctial, pass-
ough the beginning of Capricorn. See
OMY.

RIFICA'TION, *n.* Lat. *caprificatio.* An
n performed to ripen the fruit of the fig-

ocess of *caprification* being unknown to these
the figs come to nothing. *Brown.*

FICATION, a method used in the Le-
ripening the fruit of the domestic fig
neans of insects bred in that of the wild
The most ample and satisfactory

fication of the ancient Greeks and Ro-
cribed by Theophrastus, Plutarch, Pliny,
authors of antiquity, corresponds in
umstance with what is practised at this

---

day in the Archipelago and in Italy. These all agree in declaring, that the wild fig tree, caprificus, never ripened its fruit; but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches. The reason has been supposed to be that by the punctures of these insects the vessels of the fruit are lacerated, and thereby a greater quantity of nutritious juice derived thither; or that, in depositing their eggs, the gnats leave behind them some sort of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw, dipped in olive oil. Plums and pears likewise pricked by some insects, ripen much faster, and the flesh round such puncture is better tasted than the rest. Linnæus explained the operation, by supposing that the insects brought the farina from the wild fig, which contained the male flowers only, to the domestic fig, which contained the female ones. Hasselquist, from what he saw in Palestine, seemed to doubt of this mode of fructification. M. Bernard, in the Memoirs of the Society of Agriculture, opposes it more decidedly. He could never find the insect in the cultivated fig; and, in reality, it appeared to leave the wild fig after the stamina were mature, and their pollen dissipated: besides, he adds, what they may have brought on their wings must be rubbed away, in the little aperture which they would form for themselves.

CA'PRIFOLE, Lat. *caprifolium.* Minsheu spells it caprifoile. The honey-suckle. See LONICERA.

With wanton yvie-twine entrayled athwart,
And eglantine and *caprifole* emong.
Spenser. Faerie Queen.

CAPRIMULGUS, the goat-sucker, or fern-owl, in ornithology, a genus of birds of the order passeres. The beak is incurvated, small, tapering, and depressed at the base; the mouth opens very wide. They lay two eggs, which they deposit on the naked ground; the lateral toes are connected by a small membrane to the middle one. There are several species or varieties in different countries, but all nearly similar to one or other of the following:—C. Americanus has the tubes of the nostrils very conspicuous. It is a night bird, and is found in America. C. Europæus has the tubes of the nostrils hardly visible. It feeds on insects. This bird makes but a short stay with us; appearing the latter end of May, and disappearing in September. Scopoli seems to credit the report of their sucking the teats of goats, an error delivered down from the days of Aristotle. Its notes are most singular. The loudest so much resembles that of a large spinning wheel, that the Welsh call this bird aderyn y droell, or the wheel bird. It lays its eggs on the bare ground; usually two; they are of a long form, of a whitish hue, prettily marbled with a reddish brown. Its plumage is a beautiful mixture of white, black, ash-color, and ferruginous, disposed in lines, bars, and spots. The male is distinguished from the female by a great oval white spot near the end of the three first quill-feathers, and another on the outmost feathers of the tail. A variety, only eight inches in length, inhabits Virginia, in summer: arrives there towards the middle of April, and frequents the mountainous parts, but will frequently approach the houses in the evening, crying several times very loud, somewhat like the word, whip-eriwhip, or whip-poor-will, the first and last syllables pronounced loudest. Its eggs are of a dull green, with dusky spots and streaks. Another variety, larger, inhabits Virginia and Carolina; where it is called the rain-bird, because it never appears in the day-time, except when the sky, being obscured with clouds, betokens rain.

CAPRIOLE', *n.* Fr. *capriole, cabriole;* in horsemanship, a peculiar kind of leap, also called the goats' leap. The word was also formerly descriptive of springing up in dancing; but is no longer used in that sense.

Caprioles are leaps such as a horse makes in one and the same place, without advancing forwards, and in such a manner that when he is in the air, and height of his leap, he yerks or strikes out with his hinder legs even and near. A *capriole* is the most difficult of all the high menage, or raised airs. It is different from the croupade in this, that the horse does not show his shoes; and from a balotade, in that he does not yerk out in a balotade.
Farrier's Dictionary

A gallant dance, that lively doth bewray
A spirit and a virtue masculine,
Impatient that her house on earth should stay,
Since she herself is fiery and divine;
Oft doth she make her body upward fine;
With lofty turns and *caprioles* in the air,
With which the lusty tunes accordeth fair.
Davies. Orchestra.

CAPRIOLE. To make this air perfect, the horse should raise his fore and hind parts equally high, and when he strikes out behind, his croupe should be level with his withers. In rising and coming down his head should be quite steady, and his forehead presented quite straight; in rising, his fore legs should be equally and a good deal bent; he ought to strike out with all his force with his hind legs; his feet should be of an equal height; and, lastly, he should, at every leap, fall a foot and a-half or two feet distant from the spot where he rose.

CAPSARIUS, from capsa, a chest, among the Roman bankers, was he who had the care of the money-chest or coffer; also a servant who attended the Roman youth to school, carrying a satchel with their books in it; sometimes also called librarius.

CAPSICUM, in botany, Cayenne or Guinea pepper, a genus of the monogynia order, and pentandria class of plants; natural order twenty-eighth, luridæ: COR. verticillated; fruit, a sapless berry. Species four, viz.:—C. annuum, with oblong fruit, the common long-podded capsicum, commonly cultivated in the gardens. Of this there is one variety with red, and another with yellow fruit; and of these there are several sub-varieties, differing only in the size and figure of their fruit. From the pods of this plant is produced the Guinea pepper of the shops. C. frutescens, Barbary pepper, with small pyramidal fruit growing erect. C. boccatum, having dark green leaves, white flowers, and roundish red berries, from the powder of which is made the common Cayenne pepper. C. sinense, having soft red fruit, and longer dark shining green leaves.

CAPSQUARES, strong plates of iron which cover the trunnions of a gun, and keep it in the carriage. They are fastened by a hinge to the prize-plate, that they may lift up and down, and form the part of an arch in the middle to receive a third part of the thickness of the trunnions; for two-thirds are let into the carriage, and the other end is fastened by two iron wedges called the forelocks and keys.

CAP'STAN, *n.* } Fr. *cabestan;* Span. *cabes-*
CAP'STAN-BAR. } *trante*, or *cabrestante*; Belg. *kapstand.* It is sometimes erroneously called capstern. A cylinder, which is made to revolve by means of levers, for the purpose of raising any great weight, particularly the anchors of ships. The capstan-bar is the lever.

> The weighing of anchors by the *capstan* is also new.
> *Sir Walter Raleigh.*

> No more behold thee turn my watch's key,
> As seamen at the *capstan* anchors weigh.
> *Swift.*

The CAPSTAN usually consists of a strong cylinder of wood, with a truncated cone proceeding from the under extremity of its head. It is constructed on the principle of the wheel and axle, and is put in motion by bars or levers, called hand-spikes. An apparatus of this description is generally employed on ship-board for the raising of anchors and other violent manipulations.

There are commonly two capstans in a ship of war; the main-capstan, placed behind the main-mast, standing on the first deck, and reaching four or five feet above the second; this is also called the double-capstan, because it has two drum-heads, and serves two decks for drawing of anchors, and because its force may be doubled by applying hands on each deck. It has bars, whelps, &c., for turning and stopping it. The other is the jeer-capstan, or little capstan: this stands on the second deck, between the main-mast and the mizen: its use is, chiefly, to heave up the jeer-rope, or to heave up the viol, to hold off by when the anchor is weighed, and on other occasions where a less force is required than to weigh the anchors, &c.

The parts of a capstan are—the foot, which is the lowest part; the spindle, the smallest part of which turns round in an iron socket, called the saucer; the whelps, a sort of brackets set into the body of the capstan close under the bars, and reaching downwards from the lower part of the drum-head to the deck; the barrel, the main body of the whole; the drum-head, which is a broad cylindric piece of wood fixed above the barrel and whelps, in which are the holes for the bars to be put into; the bars, which are small pieces of timber by which the men heave; the pins, which are little bolts of iron, thrust perpendicularly through the holes of the drum-head, and through a correspondent hole in the end of the bar made to receive them when the bars are fixed; the pawls, which are pieces of iron bolted to one end of the beams of the deck, close to the body of the capstan, but so as that it has liberty to turn about every way; and against them do the whelps of the capstan bear; so that the capstan may be stopped from turning back. There are also hanging pawls, which reach from the deck above to the drum-head immediately beneath it; and, lastly, the swifter, which is a rope passed horizontally through holes in the outer ends o. the bars, and, being drawn tight, is designed to keep the men steady whilst they work, and to afford room for a greater number to work at once.

An important improvement has been suggested in the capstan by captain Hamilton of the royal navy, which is that of reducing the number of whelps from six to five, making the lower part more obtuse, and filling it up circular by the chocks, and also making the upper part more perpendicular in the sides, and open, the whelps being a portion of a circle.

There is a simple and powerful capstan which may now be noticed. It consists of a compound barrel, or rather of two cylinders of different radii. If a rope be attached to one extremity of the smaller cylinder, and then, after passing round a pulley be made to coil on a large one, so that as the one rope unwinds the other is rolled up, the apparatus may be considered as complete.

In describing a capstan of this kind, Dr Robison asserts, that when the diameters of the cylinders which compose the double barrel are as 16 to 17, and their circumferences as 48 to 51, the pulley is brought nearer to the capstan by about three inches for each revolution of the bar. This, however, is a mistake, as the pulley is brought only an inch and a half nearer the axis. This will be evident if we conceive a quantity of rope, equal to the circumference of the larger cylinder, to be wound up all at once, and a quantity equal to the circumference of the lesser one, to be unwound all at once. In the present case 51 inches of rope will be coiled round the larger part of the barrel by one revolution of the capstan bar, and consequently the load would be raised 25½ feet, the rope being doubled. Let 48 inches of rope be now unwound from the lesser cylinder, and the load will sink 24 feet; therefore $25\frac{1}{2} - 24 = 1\frac{1}{2}$ feet is the whole height or distance through which the weight has been moved. See MECHANICS.

CAP'SULE, *n.* } Lat. *capsula*, the dimi-
CAP'SULAR, *adj.* } nutive of *capsa*, from καψα,
CAP'SULARY, *adj.* } a little chest. The cell,
CAP'SULATE, *adj.* } or ear, in plants, which
CAP'SULATED, *adj.* } holds the seeds. The first two of the adjectives, derived from the noun, signify hollow, like a chest; the last two, enclosed, as in a chest.

> It ascendeth not directly into the throat, but ascending first into a *capsulary* reception of the breast-bone, it ascendeth again into the neck.
> *Browne's Vulgar Errours.*

> Such (seeds) as are corrupted and stale, will swim; and this agreeth unto the seeds of plants locked up and *capsulated* in their husks.
> *Id.*

> The heart lies immersed, or *capsulated*, in a cartilage, which includes the heart, as the skull doth the brain.
> *Derham.*

On threshing, I found things as I expected; the ears not filled, some of the *capsules* quite empty, and several others containing only withered hungry grain, inferior to the appearance of rye.

Burke on Scarcity.

The *capsule* of the geranium and the beard of wild oats are twisted for a similar purpose, and dislodge their seeds on wet days, when the ground is best fitted to receive them. Hence, one of these, with its adhering capsule, or beard, fixed on a stand, serves the purpose of an hygrometer, twisting itself, more or less, according to the moisture of the air.

Darwin.

CAPSULE. See Botany.

CAPTAIN, *n* & *s*.
Cap'tainry, *n*.
Cap'tainship, *n*.
Cap'tainless, *adj*.
Cap'tain-general.

Fr. *capitaine*; Ital. *capitano*; Span. *capitan*; Dut. *kapitein*; Swed. *kapten*. 'In Latin,' says Johnson, '*capitaneus*, being one of those who, by tenure *in capite*, were obliged to bring soldiers to the war.' Skinner, however, derives it from *caput*. Todd supposes it to be a hybrid word, from *caput*, and *thane*, an ancient title of honor. It was anciently the title of a chief commander; but this use of the word is now nearly, if not quite, obsolete. Connected with this, it implied a man skilled in war; and it is still occasionally thus used. Its common acceptation is a commander of a ship, or of a company in a regiment; but it is also employed in some civil cases, as in the captain of a class at school. The captain-general of an army is a general in chief, says Johnson; but the term has a larger scope, extending to authority over various bodies of forces. The British monarch is captain-general, or generalissimo, of all the troops in his dominions. Captainry is chieftainship, or power over a certain district. Captainship, besides its obvious meaning, also denotes skill in military affairs.

Nashan shall be *captain* of Judah. *Numbers.*
He sent unto him a *captain* of fifty. *Kings.*

Awhile they fled, but soone returned againe
With greater fury than before was found;
And evermore their cruell *capitaine*
Sought with his rascal routs t'enclose them round,
And, overcome, to tread them on the ground.

Spenser.

There should be no rewards taken for *captainries* of countries, no shares of bishoprics for nominating bishops. *Id.*

Dismayed not this
Our *captains*, Macbeth and Banquo?

Shakspeare. Macbeth.

A *captain!* these villains will make the name of *captain* as odious as the word occupy; therefore *captains* had need look to it. *Id. Henry IV.*

Therefore, so please you to return with us,
And of our Athens, thine and ours, to take
The *captainship*.

The lieutenant of the colonel's company might well pretend to the next vacant *captainship* in the same regiment. *Wotton.*

To diminish the Irish lords, he did abolish their pretended and usurped *captainships*. *Davies on Ireland.*

The grim *captain*, in a surly tone,
Cries out—Pack up, you rascals, and begone.

Dryden.

So the sweet lark, high poised in air,
Shuts close his pinions to his breast,
If chance his mate's shrill calls he hear,
And drops at once into her nest.
The noblest *captain* in the British fleet
Might envy William's lip those kisses sweet. *Gay.*

There's *Captain* Pannel, absent half his life,
Comes back, and is the kinder to his wife;
Yet Pannel's wife is brown, compared to me,
And Mistress Biddel sure is fifty-three. *Id.*

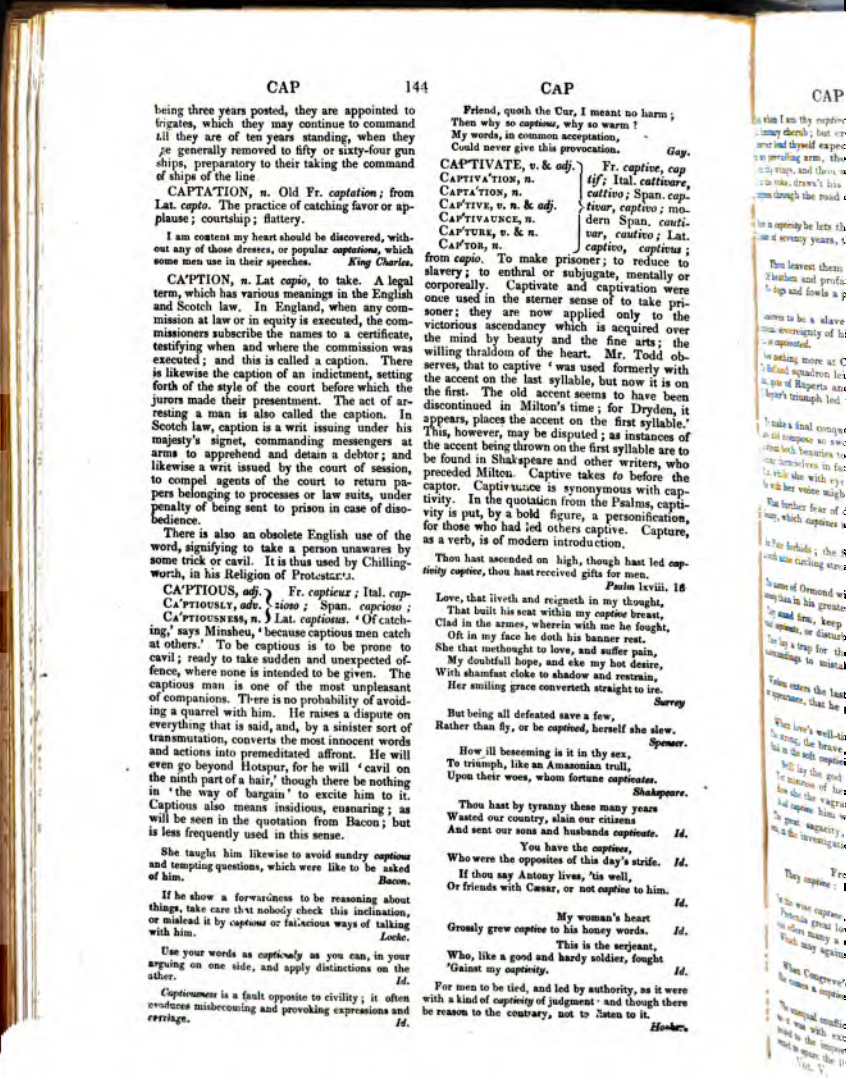
Captain Bashaw, or **Capou'dan Bashaw**, the Turkish high admiral. He holds the third office in the empire, and is invested with the same power at sea that the vizier has on shore. He has absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c.; and at Constantinople, is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black Sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and with the army. His chief revenue arises from a capitation of the islands in the Archipelago, and certain governments in Natolia and Gallipoli. He also receives the pay of all men who die during a campaign; a fifth of all prizes made by the begs; and he exacts contributions in all places where he passes.

Captain Lieutenant, an officer, who, with the rank of captain, but the pay of lieutenant, commands a troop or company in the name of some other person, who is dispensed with on account of his quality from performing the functions of his post. Thus the colonel being usually captain of the first company of his regiment, that company is commanded by his deputy as captain lieutenant.

Captain of a Company or Troop, a commissioned officer, who commands a company of foot, or a troop of horse, under a colonel. The duty of this officer is to be careful to keep his company full of able bodied soldiers; to visit their tents and lodgings, to see what is wanting; to cause them to keep themselves neat and clean in their clothes, and their arms bright. He has power in his own company to make serjeants and corporals, and lance-corporals. In the horse and foot-guards, the captains have the rank of lieutenant-colonels of the army.

Captain of a Merchant Ship, he who has the direction of the ship, her crew, lading, &c. In small ships, and short voyages, he is more ordinarily called the master. In the Mediterranean, he is called the patroon.—The proprietor of the vessel appoints the captain or master; and he is to form the crew, and choose and hire the pilots, mates, and seamen; though when the proprietor and master reside on the same spot, they generally act in concert together.

Captain, Post, an officer commanding any vessel of war from a ship of the line down to a ship-rigged sloop. Formerly, a twenty-gunned ship was the smallest that gave post rank, but by a late regulation of the Lords Commissioners of the Admiralty, the largest class of ship sloops has been added to the list of post-ships, and post-captains under three years standing are now appointed to them, unless they happened to be selected as flag-captains to admirals' ships; after



being three years posted, they are appointed to frigates, which they may continue to command till they are of ten years standing, when they are generally removed to fifty or sixty-four gun ships, preparatory to their taking the command of ships of the line

CAPTA'TION, *n.* Old Fr. *captation;* from Lat. *capto.* The practice of catching favor or applause; courtship; flattery.

> I am content my heart should be discovered, without any of those dresses, or popular *captations,* which some men use in their speeches. *King Charles.*

CA'PTION, *n.* Lat *capio,* to take. A legal term, which has various meanings in the English and Scotch law. In England, when any commission at law or in equity is executed, the commissioners subscribe the names to a certificate, testifying when and where the commission was executed; and this is called a caption. There is likewise the caption of an indictment, setting forth of the style of the court before which the jurors made their presentment. The act of arresting a man is also called the caption. In Scotch law, caption is a writ issuing under his majesty's signet, commanding messengers at arms to apprehend and detain a debtor; and likewise a writ issued by the court of session, to compel agents of the court to return papers belonging to processes or law suits, under penalty of being sent to prison in case of disobedience.

There is also an obsolete English use of the word, signifying to take a person unawares by some trick or cavil. It is thus used by Chillingworth, in his Religion of Protestants.

CA'PTIOUS, *adj.}*
CA'PTIOUSLY, *adv.*
CA'PTIOUSNESS, *n.* }
Fr. *captieux;* Ital. *capzioso;* Span. *capcioso;* Lat. *captiosus.* 'Of catching,' says Minsheu, 'because captious men catch at others.' To be captious is to be prone to cavil; ready to take sudden and unexpected offence, where none is intended to be given. The captious man is one of the most unpleasant of companions. There is no probability of avoiding a quarrel with him. He raises a dispute on everything that is said, and, by a sinister sort of transmutation, converts the most innocent words and actions into premeditated affront. He will even go beyond Hotspur, for he will 'cavil on the ninth part of a hair,' though there be nothing in 'the way of bargain' to excite him to it. Captious also means insidious, ensnaring; as will be seen in the quotation from Bacon; but is less frequently used in this sense.

> She taught him likewise to avoid sundry *captious* and tempting questions, which were like to be asked of him. *Bacon.*

> If he show a forwardness to be reasoning about things, take care that nobody check this inclination, or mislead it by *captious* or fallacious ways of talking with him. *Locke.*

> Use your words as *captiously* as you can, in your arguing on one side, and apply distinctions on the other. *Id.*

> *Captiousness* is a fault opposite to civility; it often produces misbecoming and provoking expressions and carriage. *Id.*

> Friend, quoth the Cur, I meant no harm;
> Then why so *captious,* why so warm?
> My words, in common acceptation,
> Could never give this provocation. *Gay.*

CAP'TIVATE, *v.* & *adj.*
CAPTIVA'TION, *n.*
CAPTA'TION, *n.*
CAP'TIVE, *v. n.* & *adj.*
CAP'TIVAUNCE, *n.*
CAP'TURE, *v.* & *n.*
CAP'TOR, *n.*
Fr. *captive, captif;* Ital. *cattivare, cattivo;* Span. *captivar, captivo;* modern Span. *cautivar, cautivo;* Lat. *captivo, captivus;* from *capio.* To make prisoner; to reduce to slavery; to enthral or subjugate, mentally or corporeally. Captivate and captivation were once used in the sterner sense of to take prisoner; they are now applied only to the victorious ascendancy which is acquired over the mind by beauty and the fine arts; the willing thraldom of the heart. Mr. Todd observes, that to captive 'was used formerly with the accent on the last syllable, but now it is on the first. The old accent seems to have been discontinued in Milton's time; for Dryden, it appears, places the accent on the first syllable.' This, however, may be disputed; as instances of the accent being thrown on the first syllable are to be found in Shakspeare and other writers, who preceded Milton. Captive takes *to* before the captor. Captivaunce is synonymous with captivity. In the quotation from the Psalms, captivity is put, by a bold figure, a personification, for those who had led others captive. Capture, as a verb, is of modern introduction.

> Thou hast ascended on high, though hast led *captivity captive,* thou hast received gifts for men. *Psalm* lxviii. 18

> Love, that liveth and reigneth in my thought,
> That built his seat within my *captive* breast,
> Clad in the armes, wherein with me he fought,
> Oft in my face he doth his banner rest.
> She that methought to love, and suffer pain,
> My doubtfull hope, and eke my hot desire,
> With shamfast cloke to shadow and restrain,
> Her smiling grace converteth straight to ire.
> *Surrey*

> But being all defeated save a few,
> Rather than fly, or be *captived,* herself she slew.
> *Spenser.*

> How ill beseeming is it in thy sex,
> To triumph, like an Amazonian trull,
> Upon their woes, whom fortune *captivates.*
> *Shakspeare.*

> Thou hast by tyranny these many years
> Wasted our country, slain our citizens
> And sent our sons and husbands *captivate.* *Id.*

> You have the *captives,*
> Who were the opposites of this day's strife. *Id.*

> If thou say Antony lives, 'tis well,
> Or friends with Cæsar, or not *captive* to him.
> *Id.*

> My woman's heart
> Grossly grew *captive* to his honey words. *Id.*

> This is the serjeant,
> Who, like a good and hardy soldier, fought
> 'Gainst my *captivity.* *Id.*

> For men to be tied, and led by authority, as it were with a kind of *captivity* of judgment · and though there be reason to the contrary, not to listen to it. *Hooker.*

Friend, quoth the Cur, I meant no harm;
Then why so *captious*, why so warm?
My words, in common acceptation,
Could never give this provocation. *Gay.*

CAP'TIVATE, *v.* & *adj.*
CAPTIVA'TION, *n.*
CAPTA'TION, *n.*
CAP'TIVE, *v. n.* & *adj.*
CAP'TIVAUNCE, *n.*
CAP'TURE, *v.* & *n.*
CAP'TOR, *n.*

Fr. *captive, cap tif;* Ital. *cattivare, cattivo;* Span. *captivar, captivo;* modern Span. *cautivar, cautivo;* Lat. *captivo, captivus;* from *capio.* To make prisoner; to reduce to
slavery; to enthral or subjugate, mentally or
corporeally. Captivate and captivation were
once used in the sterner sense of to take pri-
soner; they are now applied only to the
victorious ascendancy which is acquired over
he mind by beauty and the fine arts; the
willing thraldom of the heart. Mr. Todd ob-
erves, that to captive 'was used formerly with
he accent on the last syllable, but now it is on
he first. The old accent seems to have been
liscontinued in Milton's time; for Dryden, it
ppears, places the accent on the first syllable.'
his, however, may be disputed; as instances of
ie accent being thrown on the first syllable are to
e found in Shakspeare and other writers, who
receded Milton. Captive takes *to* before the
iptor. Captivaunce is synonymous with cap-
vity. In the quotation from the Psalms, capti-
ty is put, by a bold figure, a personification,
r those who had led others captive. Capture,
a verb, is of modern introduction.

Thou hast ascended on high, though hast led cap-
ity *captive*, thou hast received gifts for men.
Psalm lxviii. 18

Love, that liveth and reigneth in my thought,
That built his seat within my *captive* breast,
Clad in the armes, wherein with me he fought,
Oft in my face he doth his banner rest.
She that methought to love, and suffer pain,
My doubtfull hope, and eke my hot desire,
With shamfast cloke to shadow and restrain,
Her smiling grace converteth straight to ire. *Surrey.*

But being all defeated save a few,
Rather than fly, or be *captived*, herself she slew. *Spenser.*

How ill beseeming is it in thy sex,
To triumph, like an Amazonian trull,
Upon their woes, whom fortune *captivates*. *Shakspeare.*

Thou hast by tyranny these many years
Wasted our country, slain our citizens
And sent our sons and husbands *captivate*. *Id.*

You have the *captives*,
Who were the opposites of this day's strife. *Id.*

If thou say Antony lives, 'tis well,
Or friends with Cæsar, or not *captive* to him. *Id.*

My woman's heart
Grossly grew *captive* to his honey words. *Id.*

This is the serjeant,
Who, like a good and hardy soldier, fought
'Gainst my *captivity*. *Id.*

or men to be tied, and led by authority, as it were
a kind of *captivity* of judgment: and though there
ason to the contrary, not to listen to it. *Hooker.*

Then when I am thy *captive* talk of chains,
Proud limitary cherub; but ere then
Far heavier load thyself expect to feel
From my prevailing arm, though heaven's king
Ride on thy wings, and thou with thy compeers,
Used to the yoke, draws't his triumphant wheels
In progress through the road of heaven star-paved.
Milton's Paradise Lost.

There in *captivity* he lets them dwell
The space of seventy years, then brings them back.
Id.

Thou leavest them to hostile sword
Of heathen and profane, their carcasses
To dogs and fowls a prey, or else *captived.*
Id. Samson Agonistes.

He deserves to be a slave that is content to have the rational sovereignty of his soul, and the liberty of his will so *captivated*. *King Charles I.*

Now nothing more at Chatam's left to burn,
The Holland squadron leisurely return;
And, spite of Ruperts and of Albermarles,
To Ruyter's triumph led the *captive* Charles.
Marvell.

To make a final conquest of all me,
Love did compose so sweet an enemy,
In whom both beauties to my death agree,
Joining themselves in fatal harmony;
That, while she with eyes my heart doth bind,
She with her voice might *captivate* my mind. *Id.*

What further fear of danger can there be?
Beauty, which *captives* all things, sets me free.
Dryden.

But Fate forbids; the Stygian floods oppose,
And with nine circling streams the *captive* souls enclose.
Id.

The name of Ormond will be more celebrated in his *captivity* than in his greatest triumphs. *Id.*

They stand firm, keep out the enemy truth, that would *captivate*, or disturb them. *Locke.*

They lay a trap for themselves, and *captivate* their understandings to mistake, falsehood, and error.
Id.

Wisdom enters the last, and so *captivates* him with her appearance, that he gives himself up to her.
Addison.

When love's well-timed, 'tis not a fault to love;
The strong, the brave, the virtuous, and the wise,
Sink in the soft *captivity* together. *Id.*

Still lay the god: the nymph surprised,
Yet mistress of herself, devised
How she the vagrant might enthrall,
And *captive* him who *captives* all. *Prior.*

The great sagacity, and many artifices, used by birds, in the investigation and *capture* of their prey.
Derham.

Free from shame,
They *captive*: I ensure the penal claim.
Pope's Odyssey.

Yet the wise *captive*, meeting art with art,
Pretends great love to princely Hubert's side;
And offers many a secret to impart,
Which may against his foe's strong arms provide.
Gay.

When Congreve's favoured pantomime to grace,
She comes a *captive* queen of Moorish race.
Churchill.

The unequal conflict was terminated in fifteen days; and it was with extreme reluctance that Mahomet yielded to the importunities of his allies, and consented to spare the lives of the *captives*. *Gibbon.*

Alas! full oft on guilt's victorious car,
The spoils of virtue are in triumph borne,
While the fair *captive*, marked with many a scar,
In long obscurity oppressed, forlorn,
Resigns to tears her angel form. *Beattie.*

Hope not, though all that *captivates* the wise,
All that endears the good, exalt thy praise,
Hope not to taste repose, for envy's eyes
At fairest worth still point her deadly rays. *Id.*

Though fairest *captives* daily met his eye,
He shunned, not sought, but coldly passed them by.
Byron's Corsair.

CAPTIVES formerly became the slaves of those who took them; and though slavery, such as obtained among the ancients, is now abolished, some shadow of it still remains in respect of prisoners of war, who are accounted the property of their captors. The Romans used their captives with great barbarity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. Captives were frequently burnt in the funeral piles of the ancient warriors, as a sacrifice to the funeral gods. Those of royal or noble blood had their heads shaven, and their hair sent to Rome to serve as decorations for female toys, &c. They were led in triumph, loaded with chains, as far as the foot of the Capitoline Mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of quality were honored with golden chains on their hands and feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being carried in triumph, their effigies were frequently carried in their place.

CAPTURE is particularly applied to a ship taken at sea. Captures made at sea were formerly held to be the property of the captors after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night intra præsidia, in a place of safe custody, so that all hope of recovering them was lost. Capture is likewise used for an arrest or seizure of a criminal, debtor, &c. at land.

CAPUA, in ancient geography, a very ancient city of Italy, in Campania, and capital of that district. It was a settlement of the Osci before the foundation of Rome, and as the amazing fertility of the land, and a lucrative commerce, poured immense wealth upon its inhabitants, it became one of the most extensive and magnificent cities in the world. With riches excessive luxury crept in, and the Capuans soon lost the power of repelling those nations whom their insolence had exasperated. Roman aid was asked and granted, but the soldiers sent to defend it wished to make it their prey. Jealous of the avarice and ambition of Rome, the Capuans warmly espoused the quarrel of Carthage, and Hannibal made Capua his winter quarters after the battle of Cannæ; and there his hitherto invincible soldiers were enervated by pleasure and indolence. When, through a failure of supplies from Carthage, Hannibal was under the necessity of leaving the Capuans to defend themselves, this city, which had long been invested, was surrendered at discretion to the consuls Appius Claudius and Q. Fulvius Flaccus. The senators were put to death, the nobles imprisoned for life, and all the citizens sold and dispersed, except Vibius and his friends, who killed themselves. The buildings were spared by the victor; and Capua was left to be a harbour for the husbandmen, a warehouse for goods, and a granary for corn. Colonies were sent to inhabit it, and in process of time it regained a degree of its importance. But Genseric the Vandal was more cruel than the Romans, for he massacred the inhabitants, and burned the town. Narses rebuilt it; but in 841 it was totally destroyed by the Saracens, and the inhabitants driven to the mountains. Since the foundation of the new city, the ancient Capua has remained in ruins.

Capua, in modern geography, is a neat little city of Naples, in Terra di Lavoro, built on part of the site of old Capua. It owes its origin to the Lombard inhabitants of the old city, who, some time after the departure of the Saracens, ventured down again into the plain; but, not deeming their force equal to the defence of their former extensive circuit, built a smaller town on the banks of the Volturno, and on the site of the ancient Casilinum. In 856 Landulph formed here an independent earldom, and in the course of a few generations Capua acquired the title of a principality. In the eleventh century the Normans of Aversa expelled the Lombard race of princes, and Richard their chief became prince of Capua. The grandson of Tancred of Hauteville drove out the descendants of Richard, and united this state to the rest of his possessions. Capua is at present fortified according to the rules of modern art, and may be considered as the key of the kingdom; though far removed from the frontier, it is the only fortification that really covers the approach to Naples. It was, however, taken by the French, under general Championnet, on the 11th January, 1797. It is fifteen miles north-east of Naples, and 100 south-east of Rome. Long. 15° 7′ E., lat. 11° 26′ N.

CAPUCHINS, religious of the order of St. Francis in its strictest observance; deriving their name from capuce, or capuchon, a stuff cowl, wherewith they cover their heads. They are clothed with brown or gray; always bare-footed; never go in a coach, nor ever shave their beards. They are a reform from the order of Minors, commonly called cordeliers, set on foot in the sixteenth century by Matthew Baschi, who pretended to have been advised from heaven to practise the rule of St. Francis to the letter. Pope Clement VII, in 1525, gave him permission to retire into solitude, with as many others as chose to embrace the strict observance, and in 1528 they obtained his bull. In 1529 the order was brought into complete form; Matthew was elected general, and the chapter made constitutions.

CAPUENA, in icthyology, a fish caught in the American seas, and esteemed very delicate. It is round shaped, and usually about five inches long.

CAPURA, in botany, a genus of the monogynia order, belonging to the hexandria class of plants. C. purpurata, is a native of the East Indies.

CAPUT, the head. See Head, Skull, Face, and Anatomy.

Caput Baroniæ, the head of the barony, or Caput Honoris, the head of the honor, in ancient customs, denoted the chief seat of a nobleman, where he made his usual residence, and held his court. It could not be settled in dowry; nor could be divided among the daughters, in case there were no son to inherit; but was to descend entire to the eldest daughter, cæteris filiabus aliunde satisfactis.

Caput Gallinaginis, in anatomy, is a kind of septum, or spongious border, at the extremities or apertures of each of the vesiculæ seminales; serving to prevent the semen coming from one side, from rushing upon, and so stopping the discharge of the other.

Caput Lupinum, a term anciently applied to an outlawed felon, who might be knocked on the head like a wolf, by any one that met him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him. But now it is holden that no man is entitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.

Caput Mortuum, a name given by old chemists to fixed and exhausted residuums remaining in retorts after distillations. As these residuums are very different, according to the substances distilled, and the degree of heat employed, they are by the more accurate modern chemists particularly specified.

CAQUETA, a river of South America, which rises in the province of Quito, near the ancient city of Macao at the western base of the Andes, in the lat. of 2° N., from whence it runs in an E. S. E. direction towards the equator. Before it crosses the equator it communicates with another stream or channel of waters, running in a north-east direction; this channel is called the Negro, and is supposed to communicate with the Orinoco, whilst the main branch runs in a south-east direction to the Amazons, into which it falls in the lat. of 4° S.; this branch of the Caqueta is sometimes called the Japura Yupina, and some Portuguese adventurers in 1744 are said to have reached the Orinoco from the Amazons by this stream and that of the Negro; a circumstance which the Prussian traveller Humboldt has since said to have confirmed as practicable; having himself passed from one river to another in a canoe, he no doubt believes that there is a union of the waters of those two noble rivers; but high as his authority stands, further evidence is still wanting, as the Negro after running north-east for about 160 miles, then runs east, bearing a little south for upwards of 100 miles, when it takes a course parallel with the Japura into the Amazons about eighty miles lower down, first receiving the waters of lake Parima; this branch in its south-east course is called the Great Negro, and, being far more capacious than the Japura, has probably been mistaken for the Orinoco. It is not impossible, however, but that some of the collateral streams of this branch may in the rainy season communicate with some of the collateral branches of the Orinoco in the lat. of about 3° N. From the point where the Negro branches off to the north-east, another stream diverges more to the west, and runs parallel with the

Japura at a distance of about eighty miles into the Amazons.

CAR, Char, in the names of places, seems to have relation to the Britisn *caer*, a city. *Gibson's Camden.*

Car, *n.* } Lat. *carrus*; Fr. *char*; Ital.
Car'man, *s.* } and Sp. *carro*; Welsh and Armor. *car*; Sw. *karra*; Ger. and Dut. *karre*. A small carriage of burden, says Johnson, usually drawn by one horse or two. I suspect that the word is now seldom employed in this sense in England; its diminutive, cart, being the denomination of such vehicles; though the name is still retained in the compound, car-man. In Ireland, however, car is in common use, and is applied to various sorts of conveyances; among which is the jaunting car, a kind of carriage for excursions of pleasure. The word is more extensively known in its poetical meaning, that of a dignified or splendid vehicle; a war or triumphal chariot. The car of day is the solar luminary; the 'silver car' of Cynthia is the moon. Dryden gives the name of the northern car to the constellation, Charles' wain, or the bear.

> Henry is dead, and never shall revive:
> Upon a wooden coffin we attend,
> And death's dishonorable victory,
> We with our stately presence glorify,
> Like victors bound to a triumphal *car*.
> *Shakspeare.*
>
> Wilt thou aspire to guide the heavenly *car*,
> And with thy daring folly burn the world? *Id.*
>
> And the gilded *car* of day,
> His glowing axle doth allay
> In the steep Atlantic stream. *Milton.*
>
> Every fixt and every wandering star,
> The Pleiads, Hyads, and the Northern *Car*.
> *Dryden.*
>
> See where he comes, the darling of the war!
> See millions crowding round the gilded *car*.
> *Prior.*
>
> When a lady comes in a coach to our shop, it must be followed by a *car* loaded with Wood's money.
> *Swift.*
>
> If the strong cane support thy walking hand,
> Chairmen no longer shall the wall command;
> Even sturdy *carmen* shall thy nod obey,
> And rattling coaches stop to make a way.
> *Gay. Trivia.*
>
> Now Venus mounts her *car*; she shakes the reins,
> And steers her turtles to Cythera's plains;
> Straight to the grot with graceful step she goes,
> Her loose ambrosiac hair behind her flows. *Gay.*
>
> And many a band of ardent youths were seen,
> Some in rapture fired by glory's charms;
> Or hurled the thundering *car* along the green,
> Or march'd embattled on in glittering arms.
> *Beattie.*

Car, in archæology, a sort of carriage drawn by beasts of burden; a war chariot. In different ancient examples, cars are represented either with two or four wheels, drawn by different animals; as horses, mules, elephants, lions, panthers, &c. The invention of cars is attributed by some to Erichthonius, king of Athens, whose distorted legs prevented his walking; by others to Triptolemus, or Trochilus. The Athenians dedicated them to Pallas. The coursing cars or chariots were also used in public festivities and games; these were in the form of a shell mounted upon two wheels, higher before than behind, and ornamented with painting and sculpture. When they were drawn by two horses, they were called bigæ, when with three trigæ, and quadrigæ when they were drawn by four horses, which were always abreast.

The covered cars (currus arcuati), which were in use among the Romans, differed from the others only by having an arched covering above Some of the eastern nations used, in their wars, cars armed with scythes and other cutting instruments on the wheels; they were drawn by strong horses, and made dreadful havoc in the army of their enemies. Triumphal cars were often executed in marble. One is preserved in the museum of the Vatican at Rome. The use of triumphal cars was introduced, according to some, by Romulus, and to others by Tarquin the elder, or Valerius Poplicola.

The cars of the different divinities are drawn by those animals which are sacred to each; as that of Mercury by rams, of Minerva by owls, that of Venus by swans or doves, that of Apollo by griffins, of Juno by peacocks, and that of Diana by stags.

CARA, a river of European Russia, which directs its course towards the Arctic Ocean, and forms the boundary between Asia and Europe, for the space of about 140 miles; the Arabian chain terminating so far from the sea of Caraskoi, or Karskoi.

CAR'ABINE, or } Fr. *carabine*; Ital. *ca-*
Car'bine, *n.* } *rabino*; Ger. *carabiner*;
Carabin'ier, or } Swed. *karbin*; diminutive,
Carbin'ier, *n.* } says Thompson, of *carrabalistan*, a field bow mounted on a carriage, attached formerly to cavalry. The carabine, called also a petronel, is a small sort of fire arm, shorter than a fusil, and carrying a ball of twenty-four in the pound, hung by the light horse at a belt over the left shoulder. It is a kind of medium between the pistol and the musket, having its barrel two feet and a half long. It is generally rifled.

> He with his whole troop advanced from the gross of their horse, and discharging all their pistols on the ground, within little more than *carabine* shot of his own body, presented himself and his troop to Prince Rupert; and immediately, with his highness, charged the enemy. *Clarendon.*

CARABINS, otherwise called argoulets, were a species of hussars in the ancient French militia, and sometimes acted on foot. They were chosen and resolute men. All the principal officers of the army used to have them as their guards. And they were often stationed at the outposts for the purpose of harassing the enemy, guarding narrow passes, &c. In action they generally engaged in front of the dragoons, or on the wings of the first line. The term comes from the Arabian word Karab, which signifies generally a warlike instrument of any kind.

CARABUS, in zoology, a genus of insects of the order of coleoptera, or the beetle. The feelers are bristly; the breast is shaped like a heart, and marginated; and the elytra are likewise marginated. There are 324 known species of this genus, mostly distinguished by their color. The most remarkable is C. crepitans, the bombardier, with the breast, head, and legs, ferruginous or iron colored, and the elytra black. It keeps itself concealed among stones, and seems to make little use of its wings: when it moves, it is by a sort of jump; and, whenever it is touched, one is surprised to hear a noise resembling the discharge of a musket, in miniature, during which a blue smoke may be perceived to proceed from its anus. It may be made at any time to play off its artillery, by scratching its back with a needle. Rolandet, who first made these observations, says it can give twenty discharges successively. A bladder placed near the anus is the arsenal whence it derives its store; and this is its chief defence against an enemy, although the smoke emitted seems to be altogether inoffensive, except by causing a fright, or concealing its course. Its chief enemy is another species of the same genus, but four times larger: when pursued and fatigued, the bombardier has recourse to this stratagem, by lying down in the path of the large carabus, which advances with open mouth and claws to seize it; but, on this discharge of the artillery, suddenly draws back, and remains awhile confused: during which the bombardier conceals himself in some neighbouring crevice. If he does not find one, the large carabus returns, takes the insect by the head, and tears it off.

CARACALLA (M. Antoninus Bassianus), succeeded his father Severus, on the imperial throne of Rome, A. D. 211, and put the physicians to death for not despatching him as he would have had them. He killed his brother Geta; and put Papinianus to death because he would not defend his parricides. He married Julia, his father's widow. Going to Alexandria, he massacred almost the whole of the inhabitants. See ALEXANDRIA. In short, no fewer than 20,000 persons were murdered by his orders. At last, going from Edessa to Mesopotamia, one of his captains slew him in the seventh year of his reign.

CARACALLA, in antiquity, a long garment, having a sort of capuchin, or hood a-top, and reaching to the heels; worn among the Romans by both men and women, in the city and the camp. Spartian and Xiphilin represent the emperor Caracalla as the inventor of this garment, and hence suppose that appellation was first given him. Others, with more probability, make the caracalla originally a Gallic habit brought to Rome by that emperor, who first enjoined the soldiery to wear it, and from whom the people also called it antoninian. St. Jerome informs us that the caracalla, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet.

CARACCAS, or CARACAS, a department, province, and city, of Colombia, South America. The department of Caraccas includes the provinces of Caraccas Proper and Barinas: the residence of the intendancy or departmental government being in the city of Caraccas. The population of this department is about 550,000

The province of Caraccas in its climate, natural scenery, and fertility, is nowhere transcended. On the coasts the heat is indeed, at particular seasons, almost overpowering to Europeans,—La Guayra being, according to Humboldt's observations, one of the hottest places on the earth; but in the mountain valleys of the interior, and beside its refreshing streams, the atmosphere is mild, pure, and exquisitely sweet. The soil yields all the usual productions of the West Indies in rich abundance, and is exceedingly favorable to cochineal, dye-woods, gums, resins, sarsaparilla, sassafras, liquorice, squills, storax, cassia, aloes, and medicinal drugs: as also to maize, vanilla, cotton, indigo, sugar, tobacco, and coffee; but its staple article is cocoa, of a very superior quality. Immense herds of cattle, sheep, and deer, graze on the plains of the interior, where also horses and mules are found in considerable numbers, and all kinds of game. The forests produce every kind of useful and ornamental wood—black, red, and yellow ebony; mahogany and cedar are very common, so that the last is used for door-posts and window-frames as frequently as deal with us. The Spaniards first introduced cocoa-trees and indigo here; the former at an early period of their conquest; the latter in 1774.

La Guayra is the principal port of the province, and only five leagues from the capital, with which it communicates by a noble road. A chain of mountains, which separate it from the high valley of Caraccas, descends directly into the sea; so that the houses of La Guayra are backed with almost perpendicular rocks, and stones rolling from them frequently occasion accidents to the town. It contains but two parallel streets, running east and west, and about 7000 inhabitants. The streets are ill-paved and narrow, and the houses generally mean. The only singular objects here are the batteries, which are well disposed and kept in good order: that of Cerrocoloredo commands the roadstead. This is open to all winds, never exceeds eight fathoms in depth at a quarter of a league from the beach, and the sand so quickly buries the anchors of vessels remaining here, that they are obliged to be removed every eight days. The annual amount of its exports is said to be about £347,000, in cocoa, indigo, coffee, and hides; and the imports about 520,000, all the goods being purchased as well as sold at Caracas, and only loaded or unloaded here. The men who carry the cocoa on board the ships are remarkable for their muscular strength; and, though they frequently wade up to their breasts in the water, are never molested by the sharks that are so abundant in this part. The inhabitants say that a bishop once gave his benediction to all who should appear here, and thus tamed their nature! We are indebted to colonel Hale's interesting little work entitled Colombia, for the following:—

I. Return of the Exports of La Guayra, during the Year, ending January, 1824, together with their Value, agreeably to the Registers of the Custom House; also the Duties arising thereon.

The city of Caraccas is situate in 10° 30′ 15″ N. lat., and 67° 4′ 45″ W. long., at the entrance of the plain of Chacao, which extends three leagues east towards Cauriman and the Cuesta de Auyamas, and is two leagues and a half broad. This plain, through which runs the river Guayra, is 414 toises above the level of the sea; three other rivers (very small) cross the town from north to south. Its climate has been called a perpetual spring. The temperature is generally between 20° and 26° in the day, and 16° and 18° at night. But this general mildness is connected with great fluctuations in the weather. Humboldt sometimes, among the vapors of November and December, could scarcely think himself in one of the temperate valleys of the torrid zone; but rather in the north of Germany, among the pines and the larches overshadowing the mountains of the Hartz. The following have been given as the differences of climate between Caraccas and La Guayra:—

	Caraccas. Height 454 Toises.	LaGuayra. Level of the Sea.
Mean temp. of the year	21° to 22°	28°
Mean temp. of the hot season . . .	24	29
Mean temp. of the cold season . . .	19	23·5
Maximum	29	35
Minimum	11	21

The streets of Caraccas are straight, well paved, and well built, intersecting each other at right angles, and at a distance of about three hundred feet: there are eight squares, if such they may be called, five of them being very irregular enclosures; but the plaça major, occupying about 300 square feet, and the great market of the city, is a respectable collection of buildings, public and private. On the east is the cathedral, and on the same side begin the barracks, continued round to the south. In the market abundance of every kind of provision is to be found. Fruits, vegetables, meat, salted provisions, poultry, fish, game, bread, monkeys, parrots, &c. The churches of Candelaria and St. Paul are the only distinctions of the other squares worth naming. The houses of many individuals are well built, and of handsome appearance; being generally of masonry, with frame-work, after the Roman manner, or of brick. Humboldt thought them only too high in a region so subject to earthquakes as Caraccas. Those of the respectable inhabitants are neatly and even superbly furnished. 'We behold in them,' says an anonymous, but respectable description of Colombia, 'beautiful glasses; at the windows, and over the inside doors, elegant curtains of crimson damask; chairs, and sofas made of wood, the seats of which, covered with leather or damask, are stuffed with hair and adorned with Gothic work, but overloaded with gilding; bedsteads with deep headboards, showing nothing but gold, covered by superb damask counterpanes, and a number of down pillows in fine muslin cases, trimmed with lace. There is seldom, it is true, more than one bed of this magnificence in each house, which is in general the nuptial couch, and afterwards serves as a bed of state. The eye wanders also over tables with gilded feet; chests of drawers, on which the gilder has exhausted all the resources of his art; brilliant lustres, suspended in the principal apartments; cornices, which seem to have been dipped in gold; and rich carpets, covering at least all that part of the room where the seats of honor are placed: for the parlour furniture is disposed in such a manner, that the sofa, which constitutes the most essential article of household attire, is situate at one end, with the chairs arranged on the right and left; and opposite, the principal bed of the house, placed at the other extremity of the room, in a chamber, the door of which is open, unless it be fixed in an alcove equally open, and by the side of the seats of honor.

'Except the barracks, Caraccas possesses scarcely any public edifices but those dedicated to religion, viz. eight churches and five convents. The barracks, which will hold 2000 men, are handsome, and situate on a spot commanding beautiful views. They are storied, with a double yard, and occupied by the troops of the line alone. The militia have their barracks in the opposite part of the city. Here is also a college, founded in 1778 by the bishop Antonio Gonzalez d'Acuna, and converted into a university in 1792; and a theatre, which will hold 1500 or 1800 persons. The population in 1812 was 50,000, when, in the great earthquake on the 12th of March, 12,000 are supposed at once to have perished. The late political convulsions are supposed to have farther reduced the present population of the city to 20,000.

'It is divided between whites, negroes, and a few Indians. The first are either merchants, planters, professional, or military men; very proud, and disdaining all kinds of labor. 'The women of Caraccas are seldom blondes; but, with hair of the blackness of jet, they have the white of alabaster. Their eyes, large and finely shaped, speak, in an expressive manner, that language which is of all countries. The carnation of their lips is finely softened by the whiteness of their skins, and concurs to form that ensemble which we denominate beauty. Their stature does not correspond with their shape: we see few above the middle size, many below. It would be losing time to search for pretty feet:

sonry, with frame-work, after the Roman manner, or of brick. Humboldt thought them only too high in a region so subject to earthquakes as Caraccas. Those of the respectable inhabitants are neatly and even superbly furnished. 'We behold in them,' says an anonymous, but respectable description of Colombia, 'beautiful glasses; at the windows, and over the inside doors, elegant curtains of crimson damask; chairs, and sofas made of wood, the seats of which, covered with leather or damask, are stuffed with hair and adorned with Gothic work, but overloaded with gilding; bedsteads with deep headboards, showing nothing but gold, covered by superb damask counterpanes, and a number of down pillows in fine muslin cases, trimmed with lace. There is seldom, it is true, more than one bed of this magnificence in each house, which is in general the nuptial couch, and afterwards serves as a bed of state. The eye wanders also over tables with gilded feet; chests of drawers, on which the gilder has exhausted all the resources of his art; brilliant lustres, suspended in the principal apartments; cornices which seem to have been dipped in gold; and rich carpets, covering at least all that part of the room where the seats of honor are placed: for the parlour furniture is disposed in such a manner, that the sofa, which constitutes the most essential article of household attire, is situate at one end, with the chairs arranged on the right and left; and opposite, the principal bed of the house, placed at the other extremity of the room, in a chamber, the door of which is open, unless it be fixed in an alcove equally open, and by the side of the seats of honor.

The militia have their barracks in the opposite part of the city. Here is also a college, founded in 1778 by the bishop Antonio Gonzalez d'Acuna, and converted into a university in 1792; and a theatre, which will hold 1500 or 1800 persons. The population in 1812 was 50,000, when, in the great earthquake on the 12th of March, 12,000 are supposed at once to have perished. The late political convulsions are supposed to have farther reduced the present population of the city to 20,000.

'It is divided between whites, negroes, and a few Indians. The first are either merchants, planters, professional, or military men; very proud, and disdaining all kinds of labor. 'The women of Caraccas are seldom blondes; but, with hair of the blackness of jet, they have the white of alabaster. Their eyes, large and finely shaped, speak, in an expressive manner, that language which is of all countries. The carnation of their lips is finely softened by the whiteness of their skins, and concurs to form that ensemble which we denominate beauty. Their stature does not correspond with their shape: we few above the middle size, many below. It
losing time to search for pretty feet:

as they pass a great portion of their lives at their windows, one would say, that nature had wished to embellish only that part of their bodies which they expose to view. Their gait also is deficient in grace.'

The luxury of European capitals is by no means unattainable at Caraccas. The Spanish gravity and the Creole voluptuousness are seen in singular combination. The inhabitants of this and the other towns of Colombia seldom dine with each other, and are on the whole temperate; but they give frequent collations of coffee, chocolate, tea, cakes, and wine, when they display their porcelain and fine glass, and the ladies, both old and young, appear in all their attractions.

Before the revolution every house of respectability was encumbered by a vast train of domestic slaves. Religious festivals are so frequent at Caraccas, that there are very few days in the year on which they do not celebrate some saint, and what multiplies them almost to infinity is, that every festival is preceded by a neuvaine, or succession of nine days, consecrated to prayer; and followed by an octave, or succession of eight days, during which to their prayers the faithful join public amusements, such as fire-works, concerts, &c.: the most brilliant part of their festivals is the procession of the saint who is celebrated. When the men go to church they must always wear a coat, great coat, or cloak, and the women, rich or poor, especially the whites, are rigorously required to be in black. Their dress on this occasion generally consists in a petticoat and veil of black. Negroes only have a white veil. Posts are now forwarded regularly and periodically, from the capital only, for Maracaibo, Porto Cavello, Santa Fé, Cumana, and Guiana. All the towns lying on the road to these places enjoy the advantages of the mail. All the roads of the country are under the direct control of the Government.

The coast of the Caraccas was discovered by Columbus in 1498, during his third voyage to the western world. In 1550 the former captain-generalship of the Caraccas was established, and ultimately contained nearly 48,000 square leagues (twenty-five to a degree) and a million of inhabitants. It existed, with some slight variations of territory, to the revolution in 1810, see COLOMBIA, and comprehended the province of Venezuela, in the centre; the government of Maracaibo, westward; Guiana, south; Cumana, east; and the island of Margaretta.

CARACCI (Lewis, Augustin, and Hannibal), three celebrated painters of Bologna. Lewis was born in 1555; and was cousin-german to Augustin and Hannibal, who were brothers, the sons of a tailor, who gave them a liberal education. They were both disciples of their cousin Lewis. Augustin gained a knowledge of mathematics, natural philosophy, music, poetry, and most of the liberal arts: but, though painting was his principal pursuit, he learned the art of engraving from Cornelius Cort, and surpassed all the masters of his time. Hannibal never deviated from his pencil. These three painters, at length formed a plan of association, and founded that celebrated school, called Caracci's Academy. Hither the young students resorted to be instructed in the rudiments of painting; here the Caracci taught freely all that came. Lewis's charge was to make a collection of antique statues and bas-reliefs. They had designs of the best masters; a collection of curious books on all subjects relating to their art; and a skilful anatomist to teach what belonged to the knitting and motions of the muscles, &c. There were often disputations in the academy; and the literati, as well as painters, proposed questions, which were always decided by Lewis. The fame of the Caracci reaching Rome, the cardinal Farnese sent for Hannibal, to paint the gallery of his palace. Hannibal willingly went, having a great desire to see Raphael's works, with the antique statues, &c. The gusto which he took there from the ancient sculpture, made him change his Bolognian manner for one more learned, but less natural in the design and coloring. Augustin followed Hannibal, to assist him in the Farnese gallery; but the brothers not agreeing, Farnese sent Augustin to the court of Parma, where he died in 1602, aged forty-five. His most celebrated piece is the communion of St. Jerome, in Bologna. In the meanwhile, Hannibal continued working in the Farnese gallery at Rome; and, after eight years labor, finished the paintings in the perfection in which they are still to be seen; but the cardinal, influenced by ignorance and avarice, gave him but a little above £200. This confirmed him in a melancholy, to which his temper naturally inclined, and made him resolve never more to touch his pencil; which resolution he had undoubtedly kept, if his necessities had not compelled him to break it. It is said that his melancholy gained so much upon him, that at times it affected his reason. It did not, however, put a stop to his amours; and his debaucheries at Naples, whither he had retired for the recovery of his health, brought a distemper upon him, of which he died in 1609, in his forty-ninth year. His veneration for Raphael was so great, that it was his death-bed request to be buried in the same tomb with him; which was accordingly done in the pantheon at Rome. There are extant several prints of the Virgin, and some other subjects etched by him. He is said to have been an open-hearted man; very communicative to his scholars; and so extremely kind to them, that he generally kept his money in the same box with his colors, that they might have recourse to either as they had occasion. While Hannibal worked at Rome, Lewis was courted from all parts of Lombardy, especially by the clergy; and we may judge of his capacity and facility, by the great number of his works. In the midst of these employments Hannibal solicited him to come and assist him in the Farnese gallery, so earnestly, that he went to Rome and corrected several things in that gallery; but, after painting a figure or two, he returned to Bologna, where he died in 1619, aged sixty-four.

CAR'ACK, *n.* Span. *carraca;* Old. Fr. *carraque;* Ger. *caracke;* low Lat. *carraca.* But Minsheu derives the word from the Ital. *carico,* a freight or burden. A carack, often spelt carrack and carrick, is a large ship of burden, the same with those that are now called galleons

> Oh, sir, upon her nose, all o'er embellished with rubies, carbuncles, sapphires, declining their rich aspect to the hot breath of Spain; who sent whole armadoes of *carracks* to be ballasted at her nose. *Shakspeare*

> In which river, the greatest *carack* of Portugal may ride afloat ten miles within the forts. *Raleigh.*

> The bigger whale like some huge *carack* lay,
> Which wanteth sea room with her foes to play.
> *Waller.*

CA'RACOL, *v.* & *n.* } Sp. *caracolear*, from
Ca'racole. } *caracol*, a snail; with reference to the spiral turns in the snail's shell. But the Spanish itself is derived from Heb. *carac*, through Ar. *garagal*. In horsemanship, an oblique tread, traced out in semi-rounds, changing from one hand to the other, without observing a regular ground. The half turn, which, after his discharge, a horseman makes to pass from the front of the squadron to the rear is called caracole. The caracole is also made by a whole troop of cavalry, for the purpose indicated in the following quotation.

> When the horse advance to charge in battle, they ride sometimes in *caracoles*, to amuse the enemy, and put them in doubt whether they are about to charge them in the front or on the flank.
> *Farrier's Dictionary.*

CAR'ACT, *n.* } Κεράτιον. Lat. *ceratium*;
Car'at, *n.* } Arab. *keerat*, Per. *charat*; Fr. *carat*; Ital. *caratto*. Kennet derives it from *carracta*, which anciently signified any weight. Besides the two spellings already given, this word is spelt in a variety of ways; carract, karract, carrat, and karrat. It denotes a four-grain weight, for weighing diamonds, the grains of which are somewhat lighter than common grains; an imaginary weight by which the degree of purity in gold is indicated; and, figuratively, the value of anything.

> A mark, being an ounce troy, is divided into twenty-four equal parts, called *caracts*, and each *caract* into four grains: by this weight is distinguished the different fineness of their gold; for, if to the finest gold be put two *caracts* of alloy, both making, when cold, but an ounce, or twenty-four *caracts*, then this gold is said to be twenty-two *caracts* fine. *Cocker.*

> Thou best of gold, art worst of gold;
> Other, less fine in *caract*, is more precious.
> *Shakspeare.*

> They are men that set the *caract* and value upon things as they love them; but science is not every man's mistress. *Ben Jonson.*

CARACTACUS, a renowned king of the ancient British people, called Silures, inhabiting South Wales. Having valiantly defended his country seven years against the Romans he was at last defeated; and flying to Cartismandua, queen of the Brigantes, was by her treacherously delivered up to the Romans and led in triumph to the emperor Claudius, then at York; where his noble behaviour, and heroic but pathetic speech, obtained him not only his liberty, but the esteem of the emperor, A.D. 52. Buchanan, Monipenny, and the other ancient Scots historians, make this heroic prince one of the Scots monarchs; nephew and successor to king Metellanus: and say that he was elected general of the united army of Scots, Picts, and Britons.

CARAMANIA, an interior province of Asiatic Turkey, east of Natolia, comprising about 35,000 square miles of surface; it is excluded from the Mediterranean by Itchül, a very rugged and mountainous district, but which is commonly considered as forming part of the province of Caramania; but be that as it may, the Alpine character of the part bordering on the Mediterranean, precludes it from deriving much advantage from the water communication on that side. It is intersected by the Kisil Jermak, which, after a course of about 350 miles, flows north into the Black Sea, it has a salt water lake of considerable extent in the north-west part of the province; and in the south-west are several lakes of fresh water, which yield abundance of fish; the equilibrium of the waters of all these lakes seems to be maintained by evaporation, no visible outlet appearing; the forests in the mountainous parts of the province yield abundance of the finest timber, both oak and pine, and the vine and fig-tree, with innumerable varieties of flowering and odoriferous shrubs, luxuriate in every part. Caramania comprehends the ancient Pamphylia, and a great part of Cilicia, Pisidia and Cappadocia II. Bajazet united it to the Ottoman Empire in 1488, and thus a country once teeming with population, and studded with numerous fine cities and towns, is again a desert inhabited by tribes of Turcomans, partaking more of a negro mode than a settled life. They, however, carry on some external traffic, in camels' hair, goats' wool, and opium. Of the number of its inhabitants there is no account worthy of attention; but they probably do not exceed from 150 to 200,000. Cogni or Konich, in the lat. of 38° 10′ N. and 32° 25′ of E. long., 308 miles east of Smyrna, and 150 north of the shore of the Mediterranean is the capital; the other principal towns are Erekli, Akserai, and Ker-shehr on the banks of the Kisil Jermak; and Kaisarich, towards the eastern extremity of the province. Konich and Erekli are on the route of the caravans from Constantinople to Aleppo.

CARAPACE, the thick, solid shell, which covers the turtle; and to which adhere those fine transparent shells, called tortoise shells, of which snuff-boxes, &c. are made.

CARAPOPEBA, in zoology, a small species of lizard, common in the Brasils, and esteemed poisonous. Its body is of a liver color, and has several white spots. There are marks of white on the tail, variegated with yellow. Its eyes are bright and vivid.

CAR'AVAN, *n.* } Ar. and Per. *kerwan*;
Caravansary, *n.* } Turk. *kervan*: Fr. *caravanne*: Ital. *caravana*. Its primary meaning is a troop of persons assembled to journey together, either for commercial purposes, or in pilgrimage. Secondarily, it denotes a large covered conveyance for goods; the name of which is sometimes abbreviated into van. A caravansary, Per. *kerwansura*, is a house built in the eastern countries, chiefly in dry, barren, desert places, for the reception of travellers. It differs however, from an inn, by affording only shelter except in some few cases.

tellanus: and say that he was elected general of the united army of Scots, Picts, and Britons.

CAR'AVAN, *n.* } Ar. and Per. *kervan*;
CARAVANSARY, *n.* } Turk. *kervan*; Fr. *cara-*
anne: Ital. *caravana*. Its primary meaning is t troop of persons assembled to journey toge- her, either for commercial purposes, or in pil- rimage. Secondarily, it denotes a large co- ered conveyance for goods; the name of which s sometimes abbreviated into van. A caravan- ary, Per. *kerwansura*, is a house built in the astern countries, chiefly in dry, barren, desert laces, for the reception of travellers. It differs owever, from an inn, by affording only shelter xcept in some few cases.

They set forth
Their airy *caravan*, high over seas
Flying, and over lands, with mutual wing
Easing their flight. *Paradise Lost.*

Sir, what ill chance hath brought thee to this place,
So far from path or road of men, who pass
In troop or *caravan*? *Paradise Regained.*

When Joseph, and the blessed virgin mother, had lost their most holy son, they sought him in the retinues of their kindred, and the *caravans* of the Galilean pilgrims. *Bishop Taylor.*

The inns which receive the *caravans* in Persia, and the eastern countries, are called by the name of *caravanseries*. *Spectator.*

The spacious mansion, like a Turkish *caravansary*, entertains the vagabond with only bare lodging. *Pope's Letters.*

There, deadly Sumiel striding o'er the land,
Sweeps his red wing, and whirls the burning sand;
As winds the weary *caravan* along,
The fiery storm involves the hapless throng. *Scott.*

League after league, through many a lingering day,
Steer the swart *caravans* their sultry way;
O'er sandy wastes, on gasping camels toil,
Or print with pilgrim steps the burning soil. *Darwin.*

Caravan, or Karavan, in Africa and the east, derived from the Persian word which signifies a merchant, is a company of travellers and pilgrims, more particularly of merchants, who, for their greater security, and to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arab and native robbers. There are four regular caravans which go yearly to Mecca; the first from Damascus, composed of pilgrims and merchants from Europe and Asia; the second from Cairo, for the Mahommedans of Barbary; the third from Zibith, near the mouth of the Red Sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce of the east is carried on by caravans. Peter the Great established a trade between Russia and China by means of a caravan. Bougnon, geographer to the duke of Lorraine, published a treatise of the caravans of merchants in Asia. There are commonly four chief officers of a caravan, viz. the caravan bachi, or chief; the captain-guide; captain of the rest; and captain of distribution. The first has absolute command over all the rest: the second is absolute in the march: the office of the third only commences when the caravan stops and makes a stay: to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c. to take care of at their own peril. The treasurer of the caravan makes a fifth officer, who has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of all concerned. Any dealer is at liberty to form a caravan. He in whose name it is raised, is considered as the chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they elect a caravan bachi; after which, they appoint officers to conduct the caravan and decide all controversies. There have been also sea caravans, established on the same footing, and for the same purposes.

CARAVA'NCE, } Span. *garbanzo*, a species
Caraba'nce, *n.* } of kidney-bean, with pods like the carob.

Caravansary, or Caravansera, in architecture, a large house or public building, erected for the reception of travellers. These buildings are seldom more than one story high, and are usually of a quadrangular form, with porticos in the interior for the horses and camels; chambers for the merchants and travellers, and warehouses for the merchandise.

CAR'AVEL, or } Fr. *caravelle*; Basque,
Car'vel, *n.* } *carabella*; Span. *caravella*; Ital. *caravela*; Ger. *karfe*; Lat. *carabas*. Carvel is the spelling most in use, but the word is sometimes spelt carveil. A swift bark; a light, round, old-fashioned ship, of 120 or 140 tons burden, with a square poop, rigged and fitted out like a galley, formerly used in Spain and Portugal. It is also, as appears from Sir T. Herbert's Travels, an old name of the urtica marina, or sea blubber.

I gave them orders if they found any Indians there, to send in the little fly boat, or the *carvel*, into the river; for, with our great ships, we durst not approach the coast. *Raleigh.*

She may spare me her misen and her bonnets, strike her main petticoat, and yet outsail me. I am a *carvel* to her. *Beaumont and Fletcher.*

In an obstinate engagement with some Venetian *caravels*, the vessel on board which he served took fire. *Robertson.*

The *carvel* is a sea fome, floating on the ocean, of a globous form. *Sir T. Herbert.*

Caravel, a small vessel on the coast of France, used in fishing herrings on the banks They are commonly from twenty-five to thirty tons burden.

CAR'AWAY, *n.* Fr. *carvi*; Ital. *alcaravea*; Span. *alcarahueya*; Lat. *carum*. A plant producing warm aromatic seeds, which are used in medicine and confectionary. See Carum.

CAR'BON, *n.* } Fr. *carbone*; Lat. *car-*
Carbona'ceous, *adj.* } *bo*. Carbon is one of
Carbon'ic. } the simple bodies of chemistry; carbonaceous is that which contains carbon; carbonic that which relates to carbon.

Carbon. Charcoal is a word often employed synonymously with carbon: but, although charcoal is the form under which carbon most commonly occurs, yet it is in this form mixed with several extraneous ingredients. The diamond was concluded, by Guyton Morveau, to be the only form of pure carbon; but the experiments of Allen and Pepys have tended to show that these hard substances, although so widely different in external character and appearance, are chemically the same; the difference between them seeming to result from the different state of aggregation of their particles. It further seems that the diamond is absolutely free from both water and hydrogen; and it is in this particular, as well as in the mode by which its particles are aggregated, that the difference seems to obtain between charcoal and the diamond. Diamond converts iron into steel; which power is likewise characteristic of charcoal. See DIAMOND.

Charcoal appears to be the same substance from whatever wood it is procured, but it is usually made upon a large scale from oak, chestnut, elm, beech, or ash-wood. Lamp black may be regarded as a very pure carbon, after it has been heated red hot in a very close vessel. This is prepared by causing the dense smoke, arising from refuse resin burnt in a furnace, to be collected.

Although charcoal, as we have said, is the same in principle from whatever source it may have been obtained, some woods give much more of it than others. From 100 parts of the following woods, Messrs. Allen and Pepys obtained the quantities of charcoal as stated in the annexed table:—

Beech . .	15·00	Oak . .	17·40
Mahogany .	15·75	Fir . .	18·17
Lignum Vitæ	17·25	Box . .	20·25

Charcoal conducts electricity, although the wood from which it has been procured, if simply deprived of its moisture by evaporating it, is a non-conductor. It, however, conducts caloric very slowly. It is insoluble in water, and hence charring wood preserves it from the effects of moisture in some measure; but it has an attraction for a given portion of water, which it retains with force, and when heated nearly red hot it has the power of decomposing the fluid, forming with its oxygen either carbonic oxide or carbonic acid, according to the quantity employed; it also combines with the hydrogen of the water and forms carburetted hydrogen.

Charcoal possessing a powerful affinity for oxygen, becomes useful in deoxygenating metallic oxides, and thus reviving the metal. It combines also with sulphur and hydrogen. With iron, as above intimated, it forms steel.

It has an antiseptic power, and hence its utility in correcting the smell of foul ulcers; 'on this account,' says Dr. Ure, 'it is the best dentifrice.' It enters into the composition of gunpowder; and in its finer states, as in ivory black, lamp black, &c. it constitutes the basis of black paints, of printers' ink, and of Indian ink.

Carbon, in its union with different bases, forms important compounds, which will be elsewhere noticed. See CHEMISTRY.

CARBONA'DE, *n.* } Fr. *carbonade*; from
CARBONA'DO, *v.* & *n.* } Lat. *carbo*, a coal. Meat cut across, to be broiled on the coals. Cotgrave and Sherwood define it to mean also a 'slash over the face, which fetcheth the flesh with it.' By an extension of this meaning, the verb signifies to cut and hack any part of the body; but, thus applied, it is used only in a ludicrous or contemptuous sense.

> If I come in his way willingly, let him make a *carbonado* of me. *Shakspeare.*

CARBONARI, a sect of Italian and German freemasons.

CARBONARIA, in ancient geography, one of the mouths of the Eridanus in Italy, mentioned by Pliny: now Il Porto-di-Goro

CARBONATES are neutral salts, composed of the carbonic acid, and certain bases. See CHEMISTRY.

CARBONIC ACID. In the article AIR, and in the history of chemical science, it will be seen what an important part the discovery of this acid performed, in aiding the progress, and altering the complexion, of chemical science.

This acid is produced abundantly by various processes of nature; the best method of obtaining it artificially for the purposes of experiments, is that of pouring dilute muriatic acid upon marble, which is a carbonate of lime; in this way the carbonic acid is set at liberty, and it may be collected over water.

Most of the carbonates will, indeed, give out their carbonic acid by being treated with heat, even without the assistance of another acid, since the affinity by which it is retained, with its several bases, is for the most part feeble. Chalk, for instance, or unslaked lime, soon becomes quicklime by the application of heat, which causes the separation of the carbonic acid from the material, and thus leaves it in a caustic, or pure, or quick condition.

Carbonic acid may be analysed by the action of the metal potassium, which is capable of abstracting its oxygen (it is a compound of oxygen and carbon), and with the aid of heat burns it with great splendor; charcoal is deposited, and an oxide of potassium is formed. In this, and in some other cases, oxygen is seen alternately producing acid and alkali. If carbonic acid, obtained by burning the diamond in oxygen, be thus decomposed by potassium, the carbon makes its appearance in the form of charcoal, equal in weight to the diamond consumed.

There are some other substances which at high temperatures are capable of decomposing carbonic acid, and abstracting part of its oxygen; thus, if a mixture of two parts of hydrogen and one of carbonic acid, by volume, be passed through a red hot tube with a proper apparatus, water is formed, and carbonic oxide passes into the receiver, mixed with the excess of hydrogen.

If carbonic acid be passed over red hot charcoal, it becomes converted into carbonic oxide by taking up an additional portion of base. The blue flame, often seen upon the surface of a charcoal fire, arises from the combustion of the carbonic oxide formed in this way; the air entering at the bottom forms carbonic acid, which, passing through the red hot charcoal, becomes converted into carbonic oxide.

At a bright red heat, iron decomposes carbonic acid, by abstracting a portion of its oxygen, and forming oxide of iron and carbonic oxide (Brande).

For the various combinations of carbonic acid with bases, see CHEMISTRY, and the respective articles.

CAR'BUNCLE, *n.* } Fr. *carbuncle*; Ita.
CAR'BUNCLED, *adj.* } *carbonchio*; Span.
CARBU'NCULAR, *adj.* } *carbunculo*; Lat. *car-*
CARBUNCULA'TION, *n.* } *bunculus*. A gem, once believed to shine in the dark, like a glowing coal, whence its name, from the diminutive of carbo: red spots or pimples on the face and body, very commonly one of the [illegible] brands

the carbonic acid, and certain bases. See
HEMISTRY.

CARBONIC ACID. In the article Art, and
the history of chemical science, it will be seen
hat an important part the discovery of this acid
rformed, in aiding the progress, and altering
complexion, of chemical science.

This acid is produced abundantly by various
ocesses of nature; the best method of obtain-
it artificially for the purposes of experiment,
that of pouring dilute muriatic acid upon ma-
, which is a carbonate of lime; in this way
carbonic acid is set at liberty, and it may be
lected over water.

Most of the carbonates will, indeed, give out
r carbonic acid by being treated with heat,
n without the assistance of another acid, since
affinity by which it is retained, with its several
s, is for the most part feeble. Chalk, for
ance, or unslaked lime, soon becomes quick-
by the application of heat, which causes the
ration of the carbonic acid from the material,
thus leaves it in a caustic, or pure, or quick
ition.

rbonic acid may be analysed by the action
e metal potassium, which is capable of ab-
ting its oxygen (it is a compound of oxygen
carbon), and with the aid of heat burns it
great splendor; charcoal is deposited, and
xide of potassium is formed. In this, and
me other cases, oxygen is seen alternately
cing acid and alkali. If carbonic acid, ob-
by burning the diamond in oxygen, be
ecomposed by potassium, the carbon makes
pearance in the form of charcoal, equal in
t to the diamond consumed.

re are some other substances which at high
ratures are capable of decomposing car-
acid, and abstracting part of its oxygen:
f a mixture of two parts of hydrogen and
carbonic acid, by volume, be passed
a red hot tube with a proper apparatus,
s formed, and carbonic oxide passes into
eiver, mixed with the excess of hydrogen.
rbonic acid be passed over red hot char-
becomes converted into carbonic oxide by
up an additional portion of base. The
me, often seen upon the surface of a
fire, arises from the combustion of the
oxide formed in this way; the air en-
the bottom forms carbonic acid, which,
through the red hot charcoal, becomes
into carbonic oxide.

bright red heat, iron decomposes car-
d, by abstracting a portion of its oxy-
forming oxide of iron and carbonic

UNCLE, n. } Fr. carbuncle; Ita.
NCLED, adj. } carbonchio; Span.
NCULAR, adj. } carbunculo; Lat. car-
NCULA'TION, n. } bunculus. A gem,
ved to shine in the dark, like a glow-
hence its name, from the diminutive
red spots or pimples on the face and
commonly one of the merited brands

and punishments of a drunkard. Carbuncular signifies belonging to a carbuncle; or red, like that gem. Carbunculation is applied to the blasting of young plants, whether effected by excessive heat or by an opposite cause, when 'the parching air burns frore, and cold perform the effect of fire.'

> A *carbuncle* entire, as big as thou art,
> Were not so rich a jewel. *Shakspeare.*

> An armour all of gold; it was a king's—
> He has deserved it, were it *carbuncled*
> Like holy Phœbus' car. *Id.*

> His head
> Crested aloft, and *carbuncle* his eyes,
> With burnished neck of verdant gold.
> *Paradise Lost.*

It was a pestilent fever, but there followed no *carbuncle*, no purple or livid spots, or the like, the mass of the blood not being tainted. *Bacon.*

It is believed that a *carbuncle* doth shine in the dark like a burning cole, from whence it hath its name, *Wilkins.*

> Red blisters rising on their paps appear,
> And flaming *carbuncles* and noisome sweat.
> *Dryden.*

Carbuncle is a stone of the ruby kind, of a rich blood-red colour *Woodward.*

CARBUNCLE, in heraldry, a charge or bearing, consisting of eight radii, four whereof make a common cross, and the other four a saltier. Some call these radii, battons or staves, because round, and enriched with buttons, or pearled like pilgrim's staves.

CARBUNCLE, in medicine. See ANTHRAX.

CARBUNCLE, in natural history, a very elegant gem, whose color is deep red, with an admixture of scarlet. This gem was known among the ancients by the name of anthrax. It is usually found pure, and of the same degree of hardness with the sapphire. It is naturally of an angular figure; and is found adhering, by its base, to a heavy and ferruginous stone of the emery kind: its usual size is nearly a quarter of an inch in length, and two-thirds of that in diameter in its thickest parts: when held up against the sun it loses its deep tinge, and becomes exactly of the color of a burning charcoal, whence the name. It bears the fire unaltered. It is found only in the East Indies, and there but very rarely.

CARBURET or SULPHUR, &c. See CHEMISTRY, and HYDROGEN.

CARBURETTED HYDROGEN GAS. See CHEMISTRY.

CA'RCANET, or } Fr. *carcan*; Belg. *kar-*
CA'RKNET, *n.* } *kant*; Swed. *quark*; Mid. Lat. *carcarum*. Menage, with less force than he sometimes employs, refers its derivation to the Gr. κιρκινος, a species of chain. It is a neck-chain; a necklace. As its immediate parent is the Fr. *carcan*, it can only be applied to that which goes round the neck.

> Say that I lingered with you at your shop,
> To see the making of her *carcanet*. *Shakspeare.*

I have seen her beset and bedect all over with emeralds and pearls, and a *carcanet* about her neck. *Hakewell.*

CA'RCASS, *n.* } Fr. *carquasse*, *car-*
CA'RCASS-LIKE, *adj.* } *casse*; Mid. Lat. *carcasium*. By some etymologists, a violent attempt has been made to derive the word from *carquois*, a quiver; than which nothing, it seems, can well be more 'false and forced.' Minsheu finds its origin in *carocasso*, flesh decayed, or deprived of life. Its meanings are, a dead body; ludicrously, a living body; the decayed parts, the ruins, the remains, of anything; the uncompleted, unornamented parts of anything, as of a house; lastly, an oblong iron shell, filled with combustibles, to be thrown from a mortar.

> But when this *carcass* here to earth shall be refard,
> I do bequeath my weried ghost to serve her afterward.
> *Surrey.*

> To blot the honour of the dead,
> And with foul cowardise his *carcass* shame,
> Whose living hands immortalized his name.
> *Spenser.*

> Here's a stay,
> That shakes the rotten *carcass* of old death
> Out of his rags! Here's a large mouth, indeed,
> That spits forth death, and mountains, rocks, and
> seas! *Id.*

> To-day how many would have given their honours
> To've saved their *carcasses*! *Id.*

> A rotten *carcass* of a boat, not rigged,
> Nor tackle, sail, nor mast. *Id.*

> Where cattle pastured late, now scattered lies,
> With *carcasses* and arms, the insanguined field.
> *Milton.*

If a man visits his sick friend in hope of a legacy, he is a vulture, and only waits for the *carcass*. *Tayler.*

What could be thought a sufficient motive to have had an eternal *carcass* of an universe, wherein the materials and positions of it were eternally laid together. *Hale's Origin of Mankind.*

> The scaly nations of the sea profound,
> Like shipwrecked *carcasses* are driven aground.
> *Dryden.*

He that finds himself in any distress, either of *carcass* or of fortune, should deliberate upon the matter before he prays for a change. *L'Estrange.*

> Methinks I scent some some rich repast,
> The savor strengthens with the blast,
> Snuff then, the promised feast inhale,
> I taste the *carcass* in the gale. *Gay.*

> This penknife keen my windpipe shall divide,
> What shall I fall as squeaking pigs have dyed,
> No—To some tree this *carcass* I'll suspend,
> But worrying curs find such untimely end. *Id.*

CARCASS, a kind of combustible, consisting of an iron case filled with composition, and so called because the circles that pass from one plate to another seem to represent the ribs of a skeleton or carcass. Carcasses were formerly made oblong as well as round, but these have been found so uncertain in their flight that they are now entirely rejected. The composition with which they are filled is thus made:—boil 15 lbs. of pitch in a glazed earthen pot, and mix with it 3 lbs. of tallow, 30 lbs. of powder, 6 lbs. of saltpetre, and as many slopins as can be put in: the case is then filled with this; loaded pistol barrels, and grenades, are put in with it, and it is wrapped in a cloth and well pitched; lastly, three or four holes are bored in it, and filled with fuse composition: from these the long flame issues, and will set anything on fire within six feet of its range. Carcasses are thrown out of mortars, and weigh from fifty to 230 lbs according-ing to the size of the mortars out of which they are to be thrown. There are other carcasses for the sea-service, which so nearly resemble these, that any further description will be needless.

CARCASSONE, an ancient city and bishop's see of France, the capital of the present department of the Aude, a river which divides it into the upper and lower town. The former, which is by far the more ancient, and contains the cathedral, bears exclusively the name of the city: the lower town is of modern erection, and on the whole better built. Together they now contain about 15,000 inhabitants, who manufacture cloth for the Levant, and conduct a considerable export trade by means of the canal of Languedoc, which runs within a mile of this place. When, in the thirteenth century, Innocent III. had proscribed the Albigenses for heresy, Raymond, the reigning viscount of Carcassone, was included in that proscription. Simon de Montfort, general of the army of the church, invested Carcassone in 1209. The inhabitants, terrified at the fate of other places where the most dreadful massacres had been committed, demanded leave to capitulate; but this act of mercy was only extended to them under a condition equally cruel, unparalleled, and, indeed, incredible, if we had not the unanimous testimony of all the contemporary writers. The people were all obliged, without exception of rank or sex, to evacuate it in a state of nudity; and Agnes, the viscountess, was not exempted, though young and beautiful, from this ignominious and shocking disgrace. Carcassone is thirty-six miles west of Narbonne, and fifty south-east of Toulouse.

CAR'CELAGE, Lat. *carcer*. Prison fees.

CAR'CERAL, Lat. *carcer*. Belonging to a prison.

CARCERES, in the ancient Circensian games, were enclosures in the circus, wherein the horses were restrained till the signal was given for starting, when they at once flew open.

CARCINO'MA, *n.*
CARCINOM'ATOUS, *adj.* } From καρκινος, a crab. A cancer; a disease in the horny coat of the eye; cancerous; having a tendency to cancer.

CARCINOMA. See CANCER.

CARD, *v.* & *n.*
CARD-TABLE, *n.*
CAR'DER, *n.*
CAR'DING, *n.*
CARD-DEVOTED, *adj.*
CARD-MAKER, *n.*
CARD-MATCH, *n.*
CARD-TABLE, *n.*

Fr. *carte*; Ital. *carta*; Lat. *charta*; χάρτης. The most extensive meaning of the word card is a stiff kind of paper painted with figures, a certain number of pieces of which is called a pack, and is used in games of chance or skill. By means of this pack, health, temper, fortune, and often honor, are made a sacrifice by the card-devoted throng. A more honorable appropriation of the word is to the paper placed under the mariner's needle, and marked with the various winds; and to the instrument with which wool is carded. These cards contribute to remedy the evils which are inflicted by the other species. Card is also a short note, written in the third person, and on card paper. To card, as derived from the noun, is to play much at cards; but the verb is disused in this sense. In its usual acceptation it means to comb wool with a piece of wood, thick set with crooked wires It then has its origin from Fr. *carder*; Lat. *carduus*, teazle; the teazle having been originally employed for this purpose. In old writers we find it, too, with the opposite meanings of blending together and disentangling.

A thousand wayes he them could entertaine,
With all the thriftles games that may be found;
With mumming and with masking all around,
With dice, with *cards*, with biliards farre unfit,
With shuttlecocks, misseeming manlie wit.
Spenser. Mother Hubberd's Tale

As pilot well expert in perilous wave,
That to a steadfast star his course hath bent,
When foggy mistes or cloudy tempest have
The faithful light of that faire lampe yblent,
And cover'd heaven with hideous drerimient
Upon his *card* and compass firmes his eye,
(The masters of his long experiment)
And to them does the steddy helme apply,
Bidding his winged vessell fairely forward fly.
Spenser

The lilly, lady of the flowery field,
The flower-de-luce her lovely paramoure,
Bid thee to them thy fruitlesse labors yield,
And soone leave off this toylsome weary stoure:
Loe! loe! how brave she decks her bounteous boure,
With silken curtens and gold coverletts,
Therein to shrowd her sumptuous belamoure'
Yet neither spinnes nor *cards*, ne cares nor fretts,
But to her mother Nature all her care she letts. *Id.*

A vengeance on your crafty withered hide'
Yet I have faced it with a *card* of ten.
Shakspeare.

Am not I Christophero Sly, by occupation a *card maker*. *Id.*

The very quarters that they blow,
All the quarters that they know,
I' th' shipman's *card*. *Id.*

How absolute the knave is! we must speak by the *card*, or equivocation will undo us. *Id.*

The clothiers all have put off,
The spinsters, *carders*, fullers, weavers. *Id.*
The while their wives do sit
Beside them, *carding* wool. *May's Virgil.*

It is an excellent drink for a consumption, to be drank either alone, or *carded* with some other beer.
Bacon.

It is necessary that this book be *carded* and purged of certain base things.
Shelton. Translation of Don Quixote.

Many too nicely take exceptions at *cardes*, tables, and dice, and such mixt lusorious lots (whom Gataker well confutes), which though they be honest in themselves, yet may justly be otherwise excepted at, as they are often abused, and forbidden as things most pernicious. *Burton. Anat. Mel*

Go *card* and spin,
And leave the business of the war to men.
Dryden

Well he the title of St. Alban's bore,
For never Bacon studyed nature more;
But age allaying now that youthful heat,
Fits him in France to play at *cards* and cheat.
Marvell.

Soon she spreads her hand, the aerial guard
Descend, and sit on each important *card*;
First, Ariel perched upon a matadore. *Pope.*
See how the world its veterans rewards.
A youth of frolics, an old age of *cards*. *Id.*
On life's vast ocean diversely we sail,
Reason the *card*, but passion is the gale. *Id.*

Whether there be not every year more cash circulated at the *card-tables* of Dublin, that at all the fairs of Ireland? *Berkley.*

Sure *cards* he has for every thing,
Which well court-*cards* they name,
And statesmanlike calls in the king,
To help out a bad game. *Gay*

The *cards* are dealt, the bett is made
And the wide park hath lost its shade. *Id*

The pilot's fair machinery strews the deck,
And *cards* and needles swim in floating wreck.
Falconer.

Cards were superfluous here, with all the tricks
That idleness has ever yet contrived
To fill the void of an unfurnished brain,
To palliate dulness, and give time a shove.
Cowper.

As he that travels far, oft turns aside
To view some rugged rock or mouldering tower,
Which seen delights him not:—
So I with brush in hand and palette spread,
Paint *cards*, and dolls, and every idle thing,
That fancy finds in her excursive flights. *Id.*

Cards, Playing. Playing cards were invented in France, about the end of the reign of Charles the Fifth. No mention is made of them previous to that found in the Chronicle, written by Petit Jehan de Saintre, at the time he was page to that prince. The ordinances of St. Louis, of Charles IV., and of Charles V. at the beginning of his reign, in mentioning the different games in vogue, only speak of dice and back-gammon, without naming cards. Under Charles VI., a painter, named Jacquemin Gringonneau, who resided at Paris, in the Rue de la Verrerie, manufactured cards. In an account-book of Charles Poupart, superintendent of finance, and banker to Charles VI. there is an entry of fifty-six Paris sous paid to Jacquemin Gringonneur, the painter, for three packs of cards, gilded and colored, and of various devices, to be presented to our lord the king, for his diversion, during the intervals of his unfortunate malady. Probably it is in this circumstance that the generally received tradition, which rigid moralists have turned to so much account, of cards having been first invented for the amusement of an idiot, originated. After what has been stated above, it is unnecessary to observe that this tradition is unfounded. Like many other popular errors, however, it has been productive of so much instruction that its existence can hardly be a subject of regret.

All the early games of cards are of French invention, and most of these retain, in all countries where they are played, the whole or greater part of the terms in the original language. The names by which the playing cards are at present known in France were given to them in the reign of Charles VII.; and the game of picquet, the oldest of any known, was invented at the same period.

The mode of manufacturing playing cards is simple and may be easily explained: indeed it nearly resembles the early mode of book printing, being performed by means of blocks or engraved moulds, and a sheet of wet or moist card is laid on the form or block, which is first lightly brushed over with an ink, made of lamp black mixed with starch and water; and then rubbed off with a round list, in the hand. The court-cards they color by help of several patterns called 'stanefiles,' consisting of papers cut through with a penknife: within the apertures or incisions of which the several colors, as red, &c. are severally applied, for at the first printing the card has only a mere outline. These patterns are painted with oil-colors, to keep them from wearing out by the brushes: being laid on the paste-board they slide a brush full of color loose over the pattern, which leaving the color within the apertures, forms the face or figure of the card.

In the manufacture of cards the ingenuity of the artisan is sometimes employed to aid the arts of the sharper and professional gambler. Thus we find that there are marked and brief cards: the first of these are so called when the aces, kings, queens, and knaves, are marked on the corners of the backs with spots of different number and order, either with clear water, or water tinged with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite, diagonally; kings with two spots at the same corners; knaves with the same number transversed, &c. Brief cards are those which are either longer or broader than the rest, chiefly used at whist and picquet. The broad cards are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cutting, to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the person unacquainted with the fraud to cut them favorably for the sharper. As the pack is placed either endways or sideways to him that is to cut, the long or broad cards naturally lead him to cut to them.

CARDAMINE, in botany, lady's smock, a genus of the siliquosa order, and the tetradynamia class of plants, natural order thirty-ninth, siliquosa. The siliqua parts asunder with a spring, and the valves roll spirally backward; the stigma is entire, and the calyx a little gaping. Of this there are twenty-two known species; but the most remarkable is the C. pratensis, with a large purplish flower. It grows naturally in many parts of Britain, and is also called cuckow-flower. The single sorts are not admitted into gardens, but the double deserve a place, as making a pretty appearance during the time they are in flower. The flower of this species has a place in the Materia Medica, upon the authority of Sir George Baker, who has published five cases, two of chorea sancti viti, one of spasmodic asthma, an hemiplegia, and a case of spasmodic affections of the lower limbs, wherein the flores cardamines were supposed to have been successfully used.

CARDAMOMUM. See Amomum

CARDAN (Jerome), one of the most extraordinary geniuses of his age, was born at Pavia, 24th Sept. 1501. He was born with his head covered with black curled hair. When four years old he was carried to Milan, where his father was an advocate. At twenty he entered the university, and two years afterwards lectured on Euclid. In 1523 he went to Padua, and was admitted M. A.; and, in 1525, M. D. He married about 1531. At the age of thirty-two he became professor of mathematics at Milan. In 1539 he was admitted of the college of physicians at Milan; and in 1543 read public lectures on medicine in that city, and at Pavia in 1544; but discontinued them, because he could not get payment of his salary, and returned to Milan. In 1552 he went into Scotland, having been sent for by the archbishop of St. Andrews, then forty years old, and who had for ten years been afflicted with a shortness of breath. He began to recover from the moment that Cardan prescribed for him. Cardan, in his journey to Scotland, crossed France, and returned through Germany and the Netherlands, along the Rhine. On this occasion he went to London, and calculated king Edward's nativity. Returning to Milan, he continued there till October 1552, and thence proceeded to Pavia, whence he was invited to Bologna in 1562. He taught in this city till 1570, but left it in 1571, and went to Rome, where he lived for some time without public employment. He was, however, admitted a member of the college of physicians, and received a pension from the pope. He died at Rome, according to Thuanus, 21st September, 1575. Cardan asserted that he was always attended by an aerial spirit, emanated partly from Saturn, and partly from Mercury, who was the constant guide of his actions. He was exceedingly vain of his acquirements, and odd in his temper. Scaliger says, that, having fixed the time of his death, he abstained from food that his prediction might be fulfilled, and that his continuance to live might not discredit his art. The Lyons edition of his works, published in 1663, consist of 10 vols. fol.

CARDI'ACAL, *adj.* } Old Fr. *cardiaque*;
Car'diack, *adj.* } from καρδια, the heart.
Cordial; having the quality of invigorating the spirits. It was used by some of our old writers to express a sensation of pain in or about the heart.

> The stomachick, *cardiack*, and diuretic qualities of this fountain somewhat resemble those of tar water.
> *Bishop Berkeley.*

Cardiacs, in medicine. See Cordials.

CARDIACUS Plexus in anatomy, is formed by the nerves which supply the heart, and which are derived from the superior and inferior cervical, and first dorsal ganglia of the great sympathetic nerve, from the par vagum and the recurrent nerve.

CAR'DIALGY, *n.* from καρδια, the heart, and ἄλγος, pain. The heart-burn; a pain supposed to be felt in the heart, but more properly in the stomach, which sometimes rises all along from thence up to the æsophagus, occasioned by some acrimonious matter. *Quincy.*

CARDIALGIA. See Medicine.

CARDIFF, a borough and sea-port of South Wales, capital of Glamorganshire. It is seated on the east bank of the River Taafe or Tay, near its entrance into the mouth of the Severn. It was first founded in 1080. In 1100 Robert Fitshammon, a Norman, built and strongly fortified a castle, and surrounded it by a wall, but it was taken soon after by the native Britons In the tower of the castle, Robert, Duke of Normandy, brother of William Rufus and Henry I. was kept a close prisoner twenty-six years, and was afterwards interred in Gloucester cathedral. The castle was again taken by a Norman force, assisted by the earl of Pembroke, in 1232. It early surrendered to the parliamentary forces in the contest which placed the sovereignty of the kingdom in the hands of Cromwell; it was constituted a royal garrison at the restoration of Charles II.; it is now fast mouldering to decay, part of its stone walls having been appropriated to build dwellings in the town. Cardiff had formerly two religious houses of black and of white friars, and two churches, one of which was destroyed by an inundation in 1607, together with many other buildings; the remaining church has a high tower, of light and elegant architecture. The town is compact and well built; the town-hall is a respectable modern edifice, contiguous to it is the county gaol, and there is an elegant bridge of five arches over the Taaf. Four miles north of the town, at Melyn Griffin, is an extensive manufacture of tin-plates, and twenty-one miles further north is Merthyr Tydvil, where there are the most extensive iron works in the world, the produce of which is conveyed by a canal, having a fall of 568 feet, into the tide lock at Cardiff, from whence it is shipped to London, Bristol, and other parts. In addition to the activity which these conveyances occasion, Cardiff also ships a considerable quantity of butter and grain to Bristol. Its markets on Wednesdays and Saturdays are numerously attended, as are also three fairs on the second Wednesday in March, April, and May, and again in June, September, and November. The advantages which it derives from this traffic have occasioned a considerable increase of population since the commencement of the present century; the number in 1801 having been only 1870, and in 1821, 3521. The assizes for the county of Glamorgan are held here, and, in conjunction with seven other towns, it returns one member to parliament. Cardiff is forty miles west of Bristol, forty-seven east of Swansea, and 160 west of London. Long. 3° 12' W., lat. 51° 28' N.

CARDIGAN, a maritime county of South Wales, extending for about fifty miles along the shore of St. George's Channel, from the river Tievy, which divides it from Pembroke and Caermarthenshires on the south, to the Dovey, which divides it from Merionethshire, north; being about thirty miles in mean breadth, bounded on the east by the counties of Montgomery, Radnor, and Brecknock. The Rheidol and one or two other rivers intersect the county from east to west. Parts of this county are very fertile, both in tillage and pasture, which enables the inhabitants to produce a considerable surplus of grain, and small black cattle, with which, and some few sheep and wool, they obtain a tolerable supply of manufactured and colonial productions. Poultry and wild fowl are also abundant, was first founded in 1080. In 1100 Rober Fitshammon, a Norman, built and strongly fortified a castle, and surrounded it by a wall, but it was taken soon after by the native Britons. In the tower of the castle, Robert, Duke of Normandy, brother of William Rufus and Henry I. was kept a close prisoner twenty-six years, and was afterwards interred in Gloucester cathedral. The castle was again taken by a Norman force, assisted by the earl of Pembroke, in 1232. It early surrendered to the parliamentary forces in the contest which placed the sovereignty of the kingdom in the hands of Cromwell; it was constituted a royal garrison at the restoration of Charles II.; it is now fast mouldering to decay, part of its stone walls having been appropriated to build dwellings in the town. Cardiff had formerly two religious houses of black and of white friars, and two churches, one of which was destroyed by an inundation in 1607, together with many other buildings; the remaining church has a high tower, of light and elegant architecture. The town is compact and well built; the town-hall is a respectable modern edifice, contiguous to it is the county gaol, and there is an elegant bridge of five arches over the Taaf. Four miles north of the town, at Melyn Griffin, is an extensive manufacture of tin-plates, and twenty-one miles further north is Merthyr Tydvil, where there are the most extensive iron works in the world, the produce of which is conveyed by a canal, having a fall of 568 feet, into the tide lock at Cardiff, from whence it is shipped to London, Bristol, and other parts. In addition to the activity which these conveyances occasion, Cardiff also ships a considerable quantity of butter and grain to Bristol. Its markets on Wednesdays and Saturdays are numerously attended, as are also three fairs on the second Wednesday in March, April, and May, and again in June, September, and November. The advantages which it derives from this traffic have occasioned a considerable increase of population since the commencement of the present century; the number in 1801 having been only 1870, and in 1821, 3521. The assizes for the county of Glamorgan are held here, and, in conjunction with seven other towns, it returns one member to parliament. Cardiff is forty miles west of Bristol, forty-seven east of Swansea, and 160 west of London. Long. 3° 12′ W., lat. 51° 28′ N.

CARDIGAN, a maritime county of South Wales, extending for about fifty miles along the shore of St. George's Channel, from the river Tievy, which divides it from Pembroke and Caermarthenshires on the south, to the Dovey, which divides it from Merionethshire, north; being about thirty miles in mean breadth, bounded on the east by the counties of Montgomery, Radnor, and Brecknock. The Rheidol and one or two other rivers intersect the county from east to west. Parts of this county are very fertile, both in tillage and pasture, which enables the inhabitants to produce a considerable surplus of grain, and small black cattle, with which, and some few sheep and wool, they obtain a tolerable supply of manufactured and colonial productions. Poultry and wild fowl are also abundant,

and the herring fishery has of late years been pursued with considerable success. Its area comprises 675 square miles, divided into sixty-five parishes, which in 1821 contained 11,304 inhabited houses, and 57,784 inhabitants, being an increase of thirty per cent. since 1801. The principal towns besides Cardigan are Aberystwith and Llanbeder.

Cardigan, the chief town of the preceding county, is situate at the mouth of the Tieve, over which is a handsome bridge of seven arches, at the south-west extremity of the county. It had formerly a strong and extensive castle, of which but little now remains. It was from hence that the first descent upon Ireland was made by the English. The church is a spacious edifice; the county gaol and hall have been rebuilt within the present century. It is a corporate town governed by a mayor, twelve aldermen, &c., and unites with Aberystwith and Llanbeder in returning one member to parliament. Holds a market day on Wednesdays and Saturdays. It is twenty-five miles E. N. E. of Saint David's Head, 132 miles west of Gloucester, and about the same distance due east of Waterford, in Ireland. Its commerce by sea is confined to the coast. It owns, however, a considerable amount of shipping, employed chiefly in carrying.

Cardigan Bay is formed by St. David's Head, the western point of Pembrokeshire, south, in the latitude of 51° 44′ N. and 5° 17′ of W. longitude, and Bardsey Island, off the south-west point of Caernarvonshire, north, in the latitude of 52° 44′ and 4° 30′ of W. long.; the main coast of Caernarvonshire being in the longitude of about four degrees; it gives a stretch of about forty miles from west to east, and fifty from south to north, within the bay.

CAR'DINAL, n. & *adj.*
Car'dinalate,
Car'dinalship,
Car'dinalize, v.
} Fr. *cardinal*; Lat. *cardinalis*, principal, chief. A cardinal is one of the governors of the Romish church, by whom the pope is elected out of their own number. See the next article. Ayliffe says that 'a cardinal is so styled, because serviceable to the apostolick see, as an axle or hinge on which the whole government of the church turns; or as they have, from the pope's grant, the hinge and government of the Romish church.' A woman's cloke was at one period called a cardinal, probably from its being made of red or scarlet, the color worn by cardinals. Cardinalate and cardinalship indicate the office and rank of a cardinal. Sheldon, in his Miracles of Antichrist, uses the verb cardinalize, to signify the making cardinals. Principal or chief is expressed by the adjective, as in the instances cardinal virtues, winds, and signs.

Bulles of popes and of *cardinales*,
Of patriarches and bishoppes eke I shewe,
And in Latin I speke a wordes few
To saffron with my predication,
And for to stere men to devotion.
Chaucer. Canterbury Tales.

You hold a fair assembly;
You are a churchman, or I'll tell you *cardinal*,
I should judge now unhappily. *Shakspeare.*

The divisions of the year in frequent use with astronomers, according to the *cardinal* intersections of the zodiack; that is, the two equinoctials, and both the solstitial points. *Browne.*

His *cardinal* perfection was industry. *Clarendon.*

An ingenious cavalier, hearing that an old friend of his was advanced to the *cardinalate*, went to congratulate his eminence on his new honour. *L'Estrange.*

Whether he should divest the *cardinalship*, or rule with a double greatness. *Wotton.*

A peaceful and perpetual succession was ascertained by Alexander the third, who finally abolished the tumultary votes of the clergy and people, and defined the right of election in the sole college of *cardinals*. *Gibbon.*

Cardinals, in their first institution, were only the principal priests of the parishes of Rome; the chief priest of a parish next the bishop, being called presbyter cardinalis, to distinguish him from the other petty priests who had no church. It is uncertain when the term was first applied. Leo IV. in the council of Rome, held in 853, calls them presbyteros sui cardinis; and their churches, parochias cardinales. The cardinals continued on this footing till the eleventh century; it was a considerable time before they had the precedence over bishops, or the election of the pope. It was not, however, only at Rome that priests bore this title; for there were cardinal priests in France: thus, the curate of the parish of St. John de Vignes is called in old charters the cardinal priest of that parish. The title is also given to some bishops, quatenus bishops; e. g. to those of Mentz and Milan: the archbishop of Bourges is also, in ancient writings, called cardinal. The sacred college consists of seventy cardinals, divided into three classes; viz. bishops, priests, and deacons. They compose the pope's council or senate; in the Vatican is a constitution of pope John, which regulates the rights and titles of the cardinals; and which declares, that as the pope represents Moses, so the cardinals represent the seventy elders, who, under the pontifical authority, decide private differences. The cardinal bishops, who are the pope's vicars, bear the titles of the bishoprics assigned to them; the rest take such titles as are given them: the number of cardinal bishops has been fixed; but that of cardinal priests and deacons, and consequently the sacred college itself, has often fluctuated. Till 1125 the college only consisted of fifty-two or fifty-three; the council of Constance reduced them to twenty-four; but Sixtus IV. about 1480, raised them again to fifty-three, and Leo X. to sixty-five. The dress of a cardinal is a red soutane, a rochet, a short purple mantle, and a red hat. The cardinals began to wear the red hat at the council of Lyons, in 1243. The decree of pope Urban VIII., whereby it is appointed that the cardinals be addressed under the title of eminence, is dated 1630; till then they were called illustrissimi. When cardinals are sent to the courts of princes, it is in quality of legates a latere; and, when they are appointed governors of towns, their government is called by the name of legation. The income of a cardinal at present is not equal, we are told, to that of many English benefices. At the period of the first direct attack of France on the papal power, they had rarely more than 4000 piastres, about £900 or £1000 sterling per annum, independently of other benefices. At present their income is not above half that amount. But their expenses are not large, consisting chiefly of an old gilt coach, dirty laquais, and very inferior horses.

Cardinal Points, in cosmography, are the four intersections of the horizon with the meridian, and the prime vertical circle. Of these, two, viz. the intersection of the horizon and meridian, are called north and south, with regard to the poles they are directed to. The other two, viz. the intersections of the horizon, and first vertical, are called east and west. The cardinal points, therefore, coincide with the four cardinal regions of the heavens; and are 90° distant from each other. The intermediate points are called collateral.

CARDING, a preparation of wool, cotton, hair, or flax, by passing it between the iron points, or teeth, of two instruments, called cards, to comb, disentangle, and range the hairs or fibres thereof, and to dispose it for spinning, &c. Before the wool be carded, it is oiled, or greased with oil, whereof one-fourth of the weight of the wool is required, for wool destined for the woof of stuffs; and one-eighth for that of the warp.

CARDIOID, in the higher geometry, an algebraical curve, so called, by Castillioni, from its an heart.

CARDIOSPERMUM, in botany, heart pea, a genus of the trigynia order, and octandria class of plants; natural order thirty-ninth, trihilatæ: cal. tetraphyllous, petals four; the nectarium tetraphyllous and unequal: the caps. three, grown together, and inflated. There are four species, natives of the East and West Indies.

CARDITO, in geography, a town of Naples, in the province of Calabria ultra, eight miles E.S.E. of Reggio.

CARDIUM, the cockle, in zoology, a genus of insects belonging to the order of vermes testaceæ. The animal is a tethys; shell bivalve, nearly equilateral; equivalve, longitudinally ribbed, or grooved, with a toothed margin; hinge with two teeth near the beak, and a larger remote lateral one on each side, each locking into the opposite. Fifty-two species, inhabiting the shores of all parts of the globe. The common cockle, or cardium edule, may serve as a general specimen of the whole. In this the shell is antiquated, with twenty-eight depressed ribs, with obsolete, recurved scales. Found on all the sandy coasts in great abundance, lodged a little beneath the sand; its burrow pointed out by a round depressed spot; shell generally white, with sometimes a bluish or yellowish cast; the ribs a little rough near the circumference. The fish affords a wholesome and nutritive food. Most of the species are edible: but chiefly this and C. rusticum, which is also chiefly found on the European and especially on the Mediterranean coast.

CARDONA, a town of Spain, in Catalonia, with a castle. Near it is a mountain of solid rock salt, of which are made vases, snuff-boxes, and trinkets; and there are vineyards that produce excellent wine. It is seated on the Cardenero, thirty-six miles north-west of Barcelona.

CARDUUS, in botany, the thistle; a genus of the polygamia æqualis order, and syngenesia class of plants; order forty-ninth, compositæ: cal. ovate, imbricated with prickly scales, and the receptacle hairy. Of this genus there are thirty-six species, ten of which are natives of Britain, and, being troublesome well-known weeds, require no description. Some of the exotics are propagated in gardens for the sake of variety.

Carduus Benedictus. See Cnicus.

CA'RE, *v.* & *n.*
Ca'reful, *adj.*
Ca'refully, *adv.*
Ca'refulness, *n.*
Ca'reless, *adj.*
Ca'relessly, *adv.*
Ca'relessness, *n.*
Ca're-beguiling, *adj.*
Ca're-crazed, *adj.*
Ca're-defying, *adj.*
Ca're-tuned, *adj.*
Ca're-wounded, *adj.*

Mæs. Goth. *kara*, Ang.-Sax. care, cear; Lat. *cura*. The applications of the noun, the verb, and the adjectives and adverbs which are formed from them, are numerous. The noun expresses solicitude; anxiety; perturbation; concern; regard; and having charge of: it is used to give cautions, as in take care; and, familiarly, to manifest some degree of affection, and also defiance, as 'he cares not for me now'—'I care not for your threats;' and it also denotes the object of our attention and anxiety. The verb and its offspring, of course, partake of the nature of the noun. When the verb signifies to be inclined, to be disposed, it takes *for* before nouns, and *to* before verbs; when it means to be affected with, or to have a regard for, it takes *for*. Careless, which is frequently synonymous with cheerful, undisturbed, is combined with *of* and *about*. Careful, when it stands for provident or diligent, is followed by *of* or *for*; when it denotes watchful, cautious, it precedes *of*. Carefully, besides its obvious significations, has been employed, though not commonly, to mark a countenance wearing the lines of care. The compounds do not need any explanation.

Behold, thou hast been *careful* for us with all this *care*, what is to be done for thee? 2 *Kings* iv. 13.

Hear now this, thou that art given to pleasures, that dwellest *carelessly*. *Isaiah* xlvii. 8.

Martha, thou art *careful* and troubled about many things. *Luke* x. 41.

—————— Arviragus in all this *care*,
Hath sent his lettres home of his welfare,
And that he wol come hastily again,
Or elles had this sorwe hire herte slain.
Chaucer. Cant. Tales.

And in his way, it happed him to ride
In all his *care*, under a forest side. *Id.*

The piteous maiden, *careful*, comfortless,
Does throw out thrilling shrieks, and shrieking cries.
Spenser.

There he him found all *carelessly* displayed,
In secret shadow from the sunny ray. *Id.*

Knowing that if the worst befal them, they shall lose nothing but themselves, whereof they seem very *careless*. *Id. On Ireland.*

O my poor kingdom, sick with civil blows;
When that my *care* could not withhold thy riots,
What wilt thou do, when riot is thy *care*?
Shakspeare.

Well, sweet Jack, have a *care* of thyself. *Id.*

class of plants; order forty-ninth, compositæ. CAL. ovate, imbricated with prickly scales, and the receptacle hairy. Of this genus there are thirty-six species, ten of which are natives of Britain, and, being troublesome well-known weeds, require no description. In all his *care*, under a forest side. *Id.*

The piteous maiden, *careful*, comfortless,
Does throw out thrilling shrieks, and shrieking cries.
Spenser.

There he him found all *carelessly* displayed,
n secret shadow from the sunny ray. *Id.*

Knowing that if the worst befal them, they shall se nothing but themselves, whereof they seem very reless. *Id. On Ireland.*

O my poor kingdom, sick with civil blows;
When that my *care* could not withhold thy riots,
What wilt thou do, when riot is thy *care*!
Shakspeare.

Well, sweet Jack, have a *care* of thyself. *Id.*

You dote on her that *cares* not for your love. *Id.*

By him that raised me to this *careful* height,
From that contented hap which I enjoyed. *Id.*

You come most *carefully* upon your hour. *Id.*

Nor lose the good advantage of his grace,
By seeming cold, or *careless* of his will. *Id.*

Many young gentlemen flock to him every day; and fleet the time *carelessly*, as they did in the golden world. *Id.*

For Coriolanus, neither to care whether they love or hate him, manifests the true knowledge he has of their disposition, and, out of his noble *carelessness*, lets them plainly see it. *Id.*

These both put off a poor petitioner,
The *care-crazed* mother of a many children. *Id.*

She *cared* not what pain she put her body to, since the better part, her mind, was laid under such agony. *Sidney.*

Every word he speaks is a syren's note
To drown the *careless* hearer.
Beaumont's Sea Voyage.

A woman, the more curious she is about her face, is commonly the more *careless* about her house. *Ben Jonson*

As the Germans, both in language and manners, differed from the Hungarians, so were they always at variance with them; and therefore much *cared* not, though they were by him subdued. *Knolles.*

The death of Selymus was, with all *carefulness*, concealed by Ferhates. *Id.*

Who, in the other extreme, only doth
Call a rough *carelessness* good fashion;
Whose cloak his spurs tear, or whom he spits on,
He *cares* not. *Donne.*

Welcome, thou pleasing slumber;
Awhile embrace me in thy leaden arms,
And charm my *careful* thoughts. *Denham.*

Not *caring* to observe the wind,
Or the new sea explore. *Waller.*

Not content to see,
That others write as *carelessly* as he. *Id.*

These are the effects of doting age;
Vain doubts, and idle *cares*, and over caution.
Dryden.

Or if I would take *care*, that *care* should be,
For wit that scorned the world, and lived like me.
Id.

Flushed were his cheeks, and glowing were his eyes:
Is she thy *care*? is she thy *care*? he cries? *Id.*

Well, on my terms thou wilt not be my heir;
If thou *carest* little, less shall be my *care*. *Id.*

To cure their mad ambition they were sent
To rule a distant province, each alone:
What could a *careful* father more have done. *Id.*

By considering him so *carefully* as I did before my attempt, I have made some faint resemblance of him. *Id.*

The foolish virgins had taken no *care* for a further supply after the oil, which was at first put into their lamps, was spent, as the wise had done. *Tillotson.*

The remarks are introduced by a compliment to the works of an author, who, I am sure, would not *care* for being praised at the expence of another's reputation. *Addison.*

Having been now acquainted, the two sexes did not *care* to part. *Id.*

Envy, how *carefully* does it look! how meagre and ill-complexioned! *Collier.*

The solemn notes bid earthly passions fly,
Lull all my *cares*, and lift my soul on high.
Swift.

None taught the trees a nobler race to bear,
Or more improved the vegetable *care*. *Pope*

Thus wisely *careless*, innocently gay,
Cheerful he played. *Id.*

The freedom of saying as many *careless* things as other people, without being so severely remarked on. *Id.*

I who at sometimes spend, at others spare,
Divided between *carelessness* and *care*. *Id.*

Where few are rich, few *care* for it, where many are so, many desire it. *Temple.*

Begone! the priest expects you at the altar.
But, tyrant, have a *care*, I come not thither.
A. Philips.

Careless of thunder from the clouds that break,
My only omens from your looks I take. *Granville.*

The court he quits to fly from *care*,
And seeks the peace of rural air;
His groves, his fields, amused his hours,
He pruned his trees, he raised his flowers;
But *care* again his steps pursues,
Warns him of blasts, of blighting dews,
Of plundering insects, snails, and rains,
And droughts that starved the laboured plains:
Abroad, at home, the spectre's there,
In vain we seek to fly from *care*. *Gay.*

Soon as the morning lark salutes the day,
Through dewy fields I take my frequent way,
Where I behold a farmer's early *care*,
In the revolving labours of the year. *Id.*

Martha (her *careful* mother's name) she bore,
But now her *careful* mother was no more. *Id.*

O what passion then,
What melting sentiments of kindly *care*,
On the new parents seize. *Thomson.*

In my cheerful morn of life,
When nursed by *careless* solitude I lived,
And sung of nature with unceasing joy,
Pleased how I wandered through your rough domain.
Id.

Then, pilgrim, turn, thy *cares* forego,
All earth-born *cares* are wrong:
Man wants but little here below,
Nor wants that little long. *Goldsmith's Hermit.*

She loves to wander on the untrodden lawn,
Or the green bosom of reclining hill,
Soothed by the *careless* warbler of the dawn.
Or the lone plaint of ever-murmuring rill.
Beattie.

From such apostles, oh ye mitred heads,
Preserve the church! and lay not *careless* hands
On sculls that cannot teach and will not learn.
Cowper

These eyes that tell us what the sun is made of,
Born to be ploughed with years, and sown with *cares*,
And reaped by death, lord of the human soil.
Byron.

CARE'EN, *v. a.* & *n.*
CARE'ENAGE, *n.*

Fr. *carener*, from Lat. *carina*, a heel. Trimming and repairing the bottom of a vessel. See the next article. The neuter verb signifies to be in a state of careenage. When the workmen cannot come at the bottom of the ship, and therefore can only careen part of her, it is called a half-careen. Careenage is the place where the operation is performed, and also the money given for careening.

The fleet *careened*, the winds propitious filled
The swelling sails, the glittering transports waved
Their pennons gay, and halcyon's azure wing
With flight auspicious skimmed the placid main.
Shenstone.

CAREENING. A ship is said to be brought to the careen, when most of her lading being taken out, she is is hulled down on one side, by a small vessel, as low as necessary; and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be trimmed, seams caulked, or any thing that is faulty under water mended. Hence, when a ship lies on one side when she sails, she is said to sail on the careen.

CARE'ER, *v.* & *n.* Fr. *carriere*; Ital. *carriera*; Span. *carrera*; Lat. *currere*. To career is to move with a rapid motion. The noun denotes the ground on which a race is run; the space run over; the act of running swiftly; fulness of speed; velocity of motion; an uninterrupted course of action.

They had run themselves too far out of breath to go back the same *career*. *Sidney.*

What reign can hold licentious wickedness,
When down the hill he holds his fierce *career*.
Shakspeare.

Shall quips and sentences, and these paper bullets of the brain, undo a man from his *career* of humour. *Id.*

The sun
Declined, was hasting now with prone *career*,
To the ocean isles, and in the ascending scale
Of heaven, the stars that usher evening rose.
Milton.

With eyes, the wheels
Of beryl, and *careering* fires between. *Id.*

Through optick trunck the planet seemed to hear,
And hurls them off e'er since in his *career*. *Marvell.*

Knights in knightly deeds should persevere,
And still continue what at first they were;
Continue and proceed in honour's fair *career*.
Dryden.

Practice them now to curb the turning steed
Mocking the foe; now to his rapid speed
To give the rein, and, in the full *career*,
To draw the certain sword, or send the pointed spear.
Prior.

And but Gualthirerus' ready aid was near,
(His father's offspring by a foreign bed)
Here he had run his last of life's *career*,
And swelled the growing number of the dead.
Gay.

While storms remote but murmur in thy ear,
Nor waves in ruinous uproar round thee roll,
Yet yet a moment check thy proud *career*,
And curb the keen resolve that prompts thy soul.
Beattie.

Or rein the planets in their swift *careers*,
Gilding with borrowed light their twinkling spheres.
Darwin.

CARELIA, the eastern province of Finland, extending from Savolaxia on the north, to the gulf of Finland on the south. In the thirteenth century it became subject to Sweden, but in 1809 was ceded to Russia. It is now almost entirely included in the government of Wiborg and is thinly peopled, abounding in lakes and marshes.

CARENTAN, a town of France, in the department of the Channel, and chief place of a canton, in the district of St. Lô, situate in a marshy soil, which makes the air insalubrious. It has a port for small vessels; its principal commerce consists of butter and cattle. Lat. 49° 18' N., long. 1° 21' 50" W.

CA'RENTANE, *n.* *quarantaine*; Lat. *quadragena*, or *quarantena*. A papal indulgence, multiplying forty-fold the remission of penance.

CARES, or KARES, a town of European Turkey, seated on Mount Athos, in an elevated and pleasant situation; it has several convents, and a market every Saturday for corn and other provisions. It is seventeen miles south-east of Saloniki.

CARESAN, or CASSEN, a sea-port town of Arabia Felix, seated on the Indian Ocean, 100 leagues north-east from Aden. Lat. 16° 5' N., long. 52° 7' E.

CARE'SS, *v.* & *n.* Fr. *caresser*; *Ital. carezzare*; Sp. *acariciar*. This word, which seems not to have been in use in our language much more than a century and a half, has given rise to disputes among the etymologists. Skinner sharply reprehends Junius for deriving it from Χαριζεσθαι, and declares that it is manifestly from the Latin *carus*; while Lye as vehemently censures him, and contends for its Armorican origin. Casaubon also is of a different opinion from Junius, and derives the word from καταρεζειν, and with him Mr. Todd agrees. In Welsh, *caredig*, is beloved, loving, kind; and *carez* is excess of love; which gives some countenance to Lye's opinion. To caress is to treat with endearments, with blandishments; to fondle; and, as we say in familiar language, to make much of.

He she knew, would intermix
Grateful digressions, and solve high dispute
With conjugal *caresses*. *Milton.*

If I can feast, and please, and *caress* my mind with the pleasures of worthy speculations, or virtuous practises, let greatness and malice vex and abridge me if they can. *South.*

After his successor had publicly owned himself a Roman Catholick, he began with his first *caresses* to the church party. *Swift.*

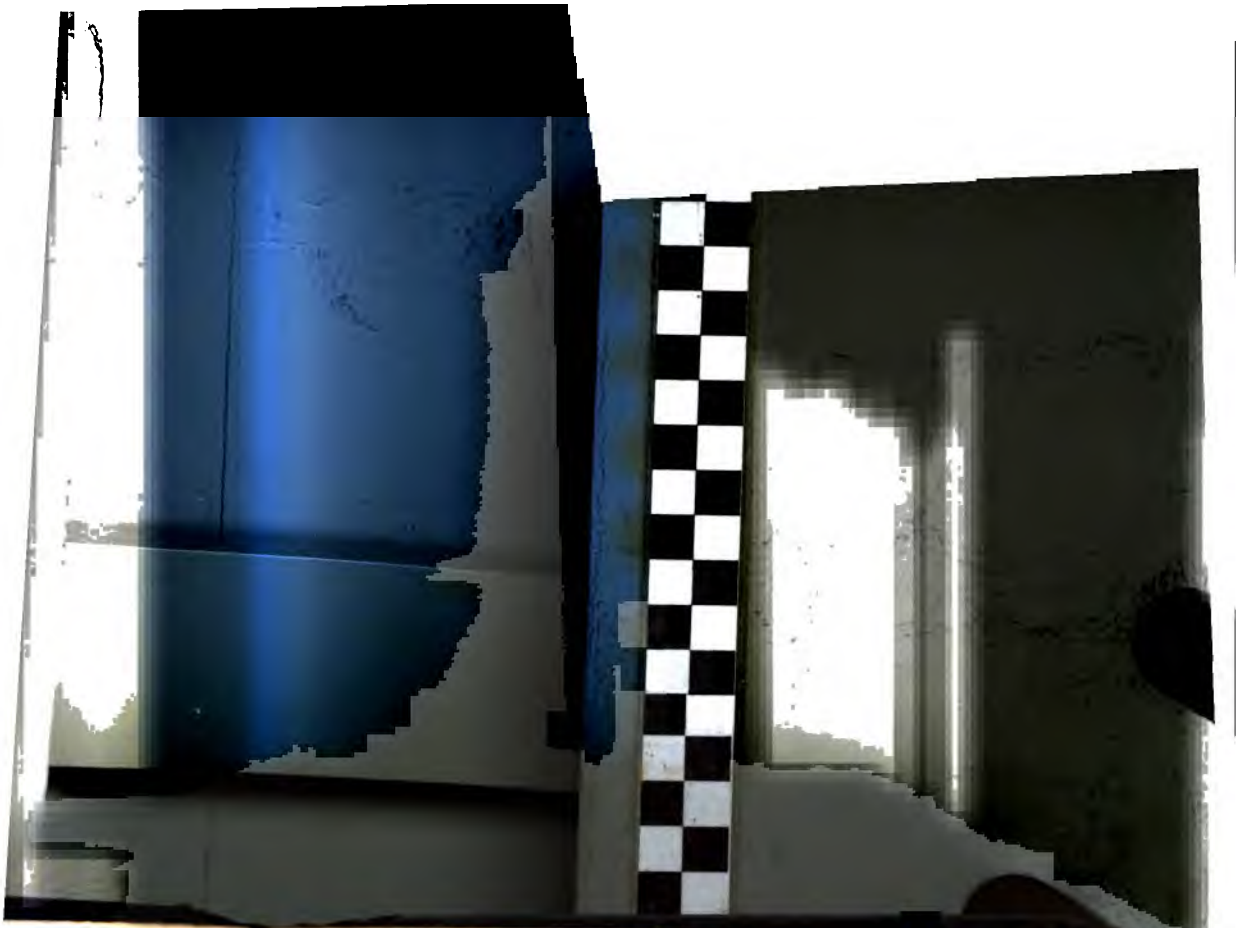
A snappish cur alone *carest*,
By lies had banished all the rest. *Gay.*

On Latmos' top see young Endymion lies,
Feigned sleep hath closed the bloomy lover's eyes,
See to her soft embraces how she steals,
And on his lips her warm *caresses* seals. *Id.*

Drear anguish urged her on to press
Full many a hand, as wild she mourned;
Of comfort glad, the drear *caress*
The damp, chill, dying hand returned.
Penrose.

Pale are those lips where soft *caresses* hung,
Wan the warm cheek, and mute the tender tongue,
Cold rests that feeling heart on Derwent's shore,
And those love-lighted eye-balls roll no more.
Darwin.

Ah! fondly youthful hearts can press,
To seize and share the dear *caress*.
Byron's Giaour.



l is thinly peopled, abounding in lakes and
rshes.

'ARENTAN, a town of France, in the de-
iment of the Channel, and chief place of a
ton, in the district of St. Lô, situate in a
shy soil, which makes the air insalubrious.
is a port for small vessels; its principal com-
ce consists of butter and cattle. Lat. 49° 18′
long. 1° 21′ 50″ W.

A'RENTANE, *n. quarantaine*; Lat. *quadra-*
or *quarantena*. A papal indulgence, mul-
ing forty-fold the remission of penance.

ARES, or KARES, a town of European Tur-
seated on Mount Athos, in an elevated and
int *situation*; it has several convents, and
ket every Saturday for corn and other pro-
s. It is seventeen miles south-east of Sa-

RESAN, or CASSEN, a sea-port town of
Felix, seated on the Indian Ocean,
agues north-east from Aden. Lat. 16° 5′
ig. 52° 7′ E.

RE'SS, *v.* & *n.* Fr. *caresser*; Ital. *ca-*
; Sp. *acariciar*. This word, which seems
have been in use in our language more
ian a century and a half, has given rise to
s among the etymologists. Skinner sharply
ods *Junius* for deriving it from *Χαρίζε-*
declares that it is manifestly from the
arus; while Lye as vehemently censures
l contends for its Armorican origin. Ca-
also *is* of a different opinion from Ju-
d derives the word from *καραφιλέω*, and
Mr. Todd agrees. In Welsh, *caredig*
d, loving, kind; and *cares* is excess of
hich gives some countenance to Lye's
To caress *is* to treat with endearments
idishments; to fondle; and, as we say
ar language, to make much of.

He she knew, would intermix
ful digressions, and solve high dispute
conjugal *caresses*. *Milton.*

CARET, *n.* Lat. *caret*, there is wanting. A note, like an inverted capital A, between two words, to denote that something has been omitted, and is interlined.

CAREW (George), an eminent commander in Ireland, born in Devonshire, in 1557. He was made president of Munster by queen Elizabeth; when, joining his forces with the earl of Thomond, he reduced the Irish insurgents, and brought the earl of Desmond to his trial. King James I. made him governor of Guernsey, and created him baron. He was an elegant scholar, and wrote Pacata Hibernia, a history of the late wars in Ireland, printed after his death in 1633. He made several collections for a history of Henry V. which are digested into Speed's History of Great Britain. Besides these, he collected materials of Irish history, in four large MS. volumes, now in the Bodleian library, Oxford.

CAREW (Richard), the eldest son of Thomas Carew, of East Anthony, and author of the Survey of Cornwall, was born in 1555. When very young he became a commoner of Christ Church College, Oxford; and at fourteen years of age had the honor of disputing, extempore, with the afterwards famous Sir Philip Sidney, in the presence of the earls of Leicester, Warwick, and other nobility. After spending three years at the university, he spent other three at the Middle Temple, and then travelled. Not long after his return to England, he married, in 1577, Juliana Arundel, of Trerice. In 1581 he was made justice of the peace, and, in 1586, high sheriff of Cornwall. In 1589 he was elected a member of the College of Antiquaries. His Survey of Cornwall was published, in 4to. at London, in 1602; and has been twice reprinted, in 1723, and 1769. Of this work Camden has spoken in high terms. He translated a work from the Italian, entitled, The Examination of Men's Wits: in which, by discovering the variety of natures, is showed for what profession each one is apt, and how far he shall profit therein. This was published at London, 1594 and 1604; but has been principally ascribed by some to his father. Carew wrote also, The true and ready Way to Learn the Latin Tongue. He was a gentleman of abilities and literature, and was held in great esteem by the most eminent scholars of his time, particularly Sir Henry Spelman.

CAREW (Sir George), younger brother of Richard, was educated at Oxford, studied the law in the inns of court, and then travelled for farther improvement. On his return he was called to the bar, and after some time appointed secretary to Sir Christopher Hatton, lord chancellor, by the special recommendation of queen Elizabeth, who gave him a prothonotaryship in the chancery, and conferred on him the honor of knighthood. In 1597 he was sent ambassador to the king of Poland. Under king James I. he was one of the commissioners for treating with the Scots concerning a union between the two kingdoms; after which he was appointed ambassador to France, where he continued from the end of 1605 till 1609. He there formed an intimacy with Thuanus, to whom he communicated an account of the transactions in Poland, whilst he was employed there, which was of great service to that admirable author in drawing up the twenty-first book of his history. After Sir George's return from France, he was appointed master of the court of Wards, which he did not long live to enjoy, for it appears by a letter from Thuanus to Camden, in 1613, that he was then lately deceased. Sir George married Thomasine, daughter of Sir Francis Godolphin, great-grandfather of the lord treasurer Godolphin, and had by her two sons and three daughters. When Sir George returned from his French embassy, he drew up, and addressed to James I. A Relation of the State of France, with the characters of Henry IV. and the principal Persons of that Court. The characters are drawn from personal knowledge and close observation, and might be of service to an historian. The composition is perspicuous and manly, and entirely free from the pedantry which prevailed in the reign of James I. This valuable tract lay long in MS. till Dr. Birch published it in 1749, at the end of his Historical View of the Negociations between the Courts of England, France, and Brussels, from 1592 to 1617.

CAREW (Thomas), descended from the family of Carew, in Gloucestershire, was gentleman of the privy chamber to Charles I. who always esteemed him one of the most celebrated wits of his court. He was the companion of Ben Jonson and Sir William Davenant, and left behind him several poems, and a masque, called Cælum Britannicum, performed at Whitehall by the king and several of his nobles, with their sons. Carew was assisted in the contrivance by Inigo Jones, and the music was set by Henry Lawes. He died in the prime of life, about 1639.

CAREX, sedge grass, in botany, a genus of plants, of the monœcia order, in the triandria class of plants, natural order third, calamariæ. The characters are male flowers, digested into a long spike: CAL. an oblong and imbricated omentum, consisting of acute, hollow, and lanceolated scales, each containing one flower: COR. none; the stamina are three erect setaceous filaments of the length of the calyx; the antheræ are oblong and erect. In the female flowers the CAL. the same as in the male; there are no petals, but an inflated oblong nectarium; the germen is triangular, and is placed within the nectarium; the style is very short; the stigmata are two or three, long, crooked, pointed, and hoary. The nectarium grows larger when the flower is fallen, and contains the seed, which is single, of an acute ovate form, triangular, and has one of its angles usually much smaller than the others. There are ninety-eight species, too well known to need any description.

CARGADORS, a name which the Dutch give to those brokers whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

CA'RGASON, *n.* } Fr. *charge*, says Dr.
CA'RGO, *n.* } Johnson. Todd refers to Old Fr. *cargue*, and the Ital. *carico* or *carco*, a burden. Skinner goes to the Lat. *carrus*. In Span. *cargo*, and *cargazon*. But the original may be traced to the Welsh *carg*, pl. *cargos*, a

charge, load, or cargo. A ship's lading; the merchandise conveyed in her.

> My body is a *cargason* of ill-humours.
>
> *Howell.*

> A ship whose *cargo* was no less than a whole world, that carried the fortune and hopes of all posterity.
>
> *Burnet's Theory.*

> This gentleman was then a young adventurer in the republic of letters, and just fitted out for the university with a good *cargo* of Latin and Greek.
>
> *Addison.*

> One gang of people instantly was put
> Upon the pumps, and the remainder set
> To get up part of the *cargo*, and what not,
> But they could not come at the leak as yet.
>
> *Byron's Don Juan.*

CARGILLITES, a denomination given to a religious sect in Scotland, more generally known by that of Cameronians. See CAMERONIANS.

CARIA, in ancient geography, a country of Asia, whose limits are extended by some, and contracted by others. Mela and Pliny extend the maritime Caria from Jasus and Halicarnassus, to Calynda, and the borders of Lycia. Ptolemy extends the inland Caria to the Meander and beyond.

CARIACO, a city in the Colombian new province of Orinoco, containing a population of about 6000. It is seated near the shore of the Carribean Sea, but is approached up a gulf or bay, extending from west to east about forty miles; on the south shore of the entrance to this gulf, is the city of Cumana, which may be regarded as the great out-port of the country, bordering on the river and gulf of Cariaco, as well as of that town, see therefore CUMANA.

CARIANS, CARIATES, or CARIATIDES, the inhabitants of Caria, called also Cares, Carissæ, Carides, and Cariæ. The Carians being the Swiss of those days, were hired and placed in the front of the battle. Cum care Carissa, denoted the behaviour of clowns. The Carians are said to have come originally from the islands to the continent, and to have been formerly subject to Minos, and called Leleges. They are of a common original with the Mysi and Lydi, having a common temple, of very ancient standing, at Melassa, a town of Caria, called Jovis Carii Delubrum. Homer calls them barbarians in language.

CARIATIDES. See CARIANS and CARYATIDES.

CARIBBEE ISLANDS, a chain of islands, forming the south-eastern boundary of the West India Seas, lying between the island of Trinidad in the lat. of 10° N. and Porto Rico, or the Virgin Islands, in the lat. of 18° N. The following list exhibits the several islands in geographical order, beginning in the south; with the latitude and longitude of the principal town or port of each island, viz.

WINDWARD.

18. Anguilla . .	18	11	—	63	16	—

In addition to the above, there are several small islands dependent on Grenada, and two or three more dependent on Guadaloupe. This groupe of islands was discovered by Columbus on his second voyage; he made the island of Deseada on the 26th of September, 1493, after which he successively visited Dominica, Guadaloupe, and several others; the whole of the Islands in the American Seas were originally designated the West Indies; but the above groupe were found inhabited by a numerous race of men, more robust and energetic than those of the large islands of Cuba, Hayti, Jamaica, and Porto Rico, though apparently of the same common origin or stock; the people being called Caribs has occasioned the islands to be distinguished by their name, of the Caribbees. Those north of Martinique are denominated by nautical men, the leeward; and those on the south, the windward; and they are sometimes called the Greater Antilles, to distinguish them from another groupe of islands which flank the coast of Caraccas, or what is now the north coast of Columbia, which is called the Lesser Antilles. Originally the whole of the islands in the American Seas were granted by the pope of Rome, in full title to Spain; but the Caribbees appear not to have been taken possession of, or even claimed by them, until the English, French and Dutch severally contended for empire in the west. The period of their falling into the hands of the different European powers, and which of those powers, will be found under the heads of the respective islands, as will also the extent, several local properties, and productions of each; the native inhabitants will be seen to have fallen a sacrifice to the cruelty, avarice, and contending passions of the several Europeans who alternately held possession of the different islands, until, in 1660, the whole of the remaining native inhabitants were concentrated upon the island St. Vincent, where scarce an individual now remains. The race as in all the larger islands may be said to be extinct. At present, 1826, of the Caribbees, Martinique, Guadaloupe, Desenda, and its other dependancies, are held by the French; St. Eustatia by the Dutch; St. Bartholomew by the Swedes; and the remainder by the English. See WEST INDIES.

CARIBBEAN SEA, is that part of the Atlantic Oceän within, or west of the Caribbee Isles, in the long. of 62° W.; or, as laid down in the preceding article, extending west to the bay of Honduras, in long. 84° W.; bounded on the north by Jamaica, St. Domingo, Porto Rico, and the Virgin Islands, and south by the Spanish main, or north coast of the new republic of Colombia, comprising a surface of water exceeding 500,000 geographical miles.

CARICA, the papaw, a genus of the decandria order, and diœcia class of plants, natural, order, thirty-eighth, tricoccæ: CAL. of the male, almost none: COR. quinquefid and funnel-shaped; the filaments in the tube of the corolla, a longer and shorter one alternately: CAL. of the female quinquedentated: COR. pentapetalous, with five stigmata; the fruit an unilocular and polyspermous berry. 1. C. papaya, rises with a thick, soft, herbaceous stem, to the height of eighteen or twenty feet, naked till within two or three feet of the top. The leaves come out on every side, upon very long foot-stalks. Those undermost are almost horizontal, but those on the top are erect; in full grown plants they are very large, and divided into many lobes deeply sinuated. The flowers of the male plant are produced from between the leaves on the upper part of the plant: these are of a pure white, and have an agreeable odor. The flowers of the female papaya also come out from between the leaves towards the upper part of the plant; they are large, bell-shaped, composed of six petals, and commonly yellow; when these fall away, the germen swells to a large fleshy fruit, of the size of a small melon. These fruits are of different forms, some angular and compressed at both ends; others oval or globular, and some pyramidal. When the roundish fruit are nearly ripe, the inhabitants of India boil and eat them with their meat, as we do turnips. They have somewhat the flavor of a pompion. Previous to boiling they soak them for some time in salt and water, to extract the corrosive juice; but they mostly pickle the long fruit, and thus they make no bad succedaneum for mango. The buds of the female flowers are gathered, and made into a sweet meat; and the shells of the ripe fruit are boiled, and, with the insides, are eaten with sugar and pepper, like melons. 2. C. prosoposa differs from the other in having a branching stalk, the lobes of the other shaped like a pear, and of a sweeter flavor than the papaya. Both species are natives of hot countries, they cannot be preserved in Britain unless constantly kept in a warm stove. They are easily propagated by seeds, which are annually brought in plenty from the West Indies, though the seeds of the European plants ripen well. When grown to a large size, they make a noble appearance with their long upright stems, garnished on every side near the top with large shining leaves, spreading to nearly three feet all round the stem: the flowers of the male sort coming out in clusters on every side, and the fruit of the female growing round the stalks between the leaves, are so different from anything of European production, as well as to entitle these plants to a place in the gardens of the curious.

CARICATURA, in painting, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object. It was practised by the ancients, as well as by many eminent modern artists; there are several on the walls of Herculaneum, one of which in particular represented Æneas, Anchises, and Ascanius, with the heads of hogs and an ape. English artists have long been celebrated for indulging the satirical vein in painting, and multitudes of caricatures are daily making their appearance on public men and manners. If Hogarth is excepted as a painter of a higher class, no one has excelled Gillray in this branch of art. The two Cruikshanks at present are at the head of this department, and have often approached the best of Gillray's works.

CARICATUR'E, *v.* & *n.*
CARICATU'RA, *n.*
CARICATU'RIST, *n.*
Ital. *caricatura*, to load or overcharge. A caricature is a colored or distorted representation, which exaggerates defects of person or style, to a ridiculous excess, yet preserves a resemblance of the object. The caricaturist is an artist, who may often make us laugh, but whom we seldom esteem. It is in the service of politics that this deforming art is most frequently employed.

CA'RICOUS TUMORS, *n.* Lat. *carica*, a fig. A tumor in the form of a fig.

CARIDES, or CARIDA, a town of Asia Minor, in Phrygia.

CARIDIEN, an island of Asia, in the Indian Sea, near the west coast of the island of Ceylon; twelve miles long and two wide.

CA'RIES, *n.*
CARIO'SITY, *n.*
CA'RIOUS, *adj.*
Lat. *caries*. The rottenness peculiar to a bone; rottenness; rotten. See MEDICINE and SURGERY. Indexes.

> Fistulas of long continuance, are, for the most part, accompanied with ulcerations of the gland, and *caries* in the bone. *Wiseman.*
>
> This is too general, taking in all *cariosity* and ulcers of the bones. *Id.*
>
> I discovered the blood to arise by a *carious* tooth. *Id.*

CARILLONS, a species of chimes frequent in the ci-devant Netherlands, particularly at Ghent and Antwerp, and played on a number of bells in a belfrey, forming a complete scale of tones and semitones, like those on the harpsichord and organ. There are pedals communicating with the great bells, upon which the carilloneur with his feet plays the base to sprightly airs performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough asunder to be struck with violence and velocity by either of the hands edgeways, without danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. They are heard through a large town. The music bells of Edinburgh are a species of carillons

CARINA, Lat. The keel of a ship, or that long piece of timber running along the bottom of the ship from head to stern, upon which the whole structure is built. It is also used for the whole capacity of a ship, containing all the space below the decks; and sometimes for the whole ship. Among anatomists it is used, 1. to denote the spina dorsi; 2. the embryo of a chick appearing in an incubated egg. It consists of the entire vertebræ, as they appear after ten or twelve days incubation. It is thus called, because crooked in the form of the keel of a ship. Among botanists it is used for the lower petalum of a papilionaceous flower.

CARINÆ, women hired among the ancient Romans to weep at funerals: thus called from Caria, the country whence most of them came.

CA'RINATED, *adj.* Lat. *carina.* Bent like the hull of a ship; whence, in botany, a leaf, a scale, a nectary, is said to be carinated, when it is longitudinally hollow above, and has a corresponding sharpish protuberance beneath.

CARINTHIA, Duchy of, an interior province or division of the Austrian empire, lying between the lat. of 46° 21' and 47° 6' N. and 12° 30' to 14° 50' of E. long. comprising an area of about 3500 English square miles; the west end borders on the Tyrol, and it is bounded on the north by the bishopric of Saltzburgh and Upper Styria, east by Lower Styria, and south by Upper Carniola, and the Venetian territory. The river Drave, which rises in the Tyrol and falls into the Danube at Belgrade, intersects Carinthia; its whole extent from west to east receiving several tributary streams, both from the north and south. There are also several lakes, which, as well as the rivers, yield abundance of excellent fish. It is a mountainous and woody district, the mountains yielding abundance of iron, lead, and copper, as well as quicksilver, bismuth, and zinc, and also the purest marbles, and a variety of gems; whilst the forests abound with the finest timber, the valleys afford some excellent pasturage, as well as fertile lands for tillage; but being edged in by mountains both on the north and south, whilst the remoteness of the course of the Drave precludes it from being made available as a channel of conveyance, the rich store of natural products which this district contains are of little advantage either to the inhabitants or to the world. Could a water communication be obtained with the Adriatic, which, by a social and reciprocal order of society, might be effected with the west end of the province, either by the Tajamento, or the Piave, Carinthia might then rank among the most interesting and important districts of Europe; but under the bigoted, blind, and passive policy of Austria, the inhabitants of Carinthia pass away their time in indolence and apathy; such supply of foreign productions as they do get being obtained in exchange for the cattle which are driven to the markets of the towns of Italy. Carinthia at one time formed part of the territory of Bavaria, but on Rodolphus attaining the imperial dignity, he conferred it in 1282 on Maynard, count of Tyrol, on condition that it should revert to the house of Austria, in default of Maynard's male issue, which happened in 1331. It was overrun by the French under Buonaparte, during his campaign in Italy; he had his head quarters at Villach in March 1797, but it has since reverted again to Austria, and is divided for local jurisdiction into two parts, Upper and Lower; the former on the west, containing about 175,000 inhabitants, and the latter on the east, about 105,000. The principal towns in the upper part are Gmund and Villach; and in the lower, Clagenfurt (which is the capital of the duchy), Wolfsberg, Wolfenmarck, Pleyburg, &c. The inhabitants, who speak chiefly the Sclavonian language, are bigoted adherents to the ceremonies of the Romish church, and contribute to the Austrian government an impost of about £250,000 English per annum.

CARIOSUS, rotten stone, in oryctology, a genus of argillaceous earths; consisting of alumine, silica, and carbonate of lime, with a small portion of iron; light, soft, falling to powder in water; effervescing with nitric acid; hardening a little red in the fire. One species only. Found in Derbyshire and other coal countries; generally over veins of coal; colors dirty yellow, dull brown, or gray. It easily moulders in the open air, for which reason it has been denominated rotten-stone. It is principally used for polishing metals and other substances.

CARIPI, a kind of cavalry in the Turkish army. Of these about 1000 are not slaves, nor bred up in the seraglio, like the rest; but are generally Moors or renegado Christians, who, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse guards to the grand seignior.

CARISBROOK, a village contiguous to Newport, in the Isle of Wight, remarkable for its castle and church, which are both very ancient. The church had once a convent of monks annexed, part of which is now a farm-house, still retaining the name of the priory. The castle, which is a picturesque edifice, stands on an eminence, and was the prison of Charles I. in 1647, before he was delivered to the parliament forces. It is now nominally the seat of the governor of the Isle of Wight. See Isle of Wight.

CARISSA, in botany, a genus of the monogynia order and pentandria class of plants; natural order thirtieth, contortæ: cor. twisted; berries one or two; many-seeded. Five species; some spinous, others unarmed; all Indian plants. The fruit of C. carandus is eaten by the natives, and is of pleasant taste.

CARITATIS Poculum, the grace cup, was an extraordinary allowance of wine or other liquors, wherein the religious at festivals drank in commemoration of their founder and benefactors.

CA'RK, *v.* & *n.* } Welsh, & Ang.-Sax. carc.
Ca'rking, *n.* } This seems a sufficiently satisfactory derivation; but Junius chooses to go further a field, and makes Καρκαιρω the parent word, though with no small portion of etymological distortion. *Carc* in the Welsh means care, solicitude, anxiety; *carcus*, solicitous, anxious, careful. The sense of the English word is the same. Cark as a noun is obsolete; the verb is nearly so, and is always used in an ill sense. Unconnected with this, and whence derived I know not, is carke; denoting, says Minsheu, 'a quantity of wool, whereof thirty make a sarpler,' equal to half a sack.

> What pathe liste you to treade? what trade will you assay?
> The courts of plea by braule and bate drive gecie peace away.

the capital of the duchy), Wolfsberg, Wellemarck, Pleyburg, &c. The inhabitants, who speak chiefly the Sclavonian language, are bigoted adherents to the ceremonies of the Romish church, and contribute to the Austrian government an impost of about £250,000 English per annum.

CARIOSUS, rotten stone, in oryctology, a genus of argillaceous earths; consisting of alumine, silica, and carbonate of lime, with a small portion of iron; light, soft, falling to powder in water; effervescing with nitric acid; hardening a little red in the fire. One species only. Found in Derbyshire and other coal countries; generally over veins of coal; colors dirty yellow, [illegible] brown, or gray. It easily moulders in the open air, for which reason it has been denominated rotten-stone. It is principally used for polishing metals and other substances.

CARIPI, a kind of cavalry in the Turkish army. Of these about 1000 are not slaves, or bred up in the seraglio, like the rest; but are generally Moors or renegado Christians, who, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse guards to the grand seignior.

CARITATIS POCULUM, the grace cup, was an extraordinary allowance of wine or other iquors, wherein the religious at festivals drank n commemoration of their founder and bene- actors.

CA'RK, *v.* & *n.* } Welsh, & Ang.-Sax. car.
CA'RKING, *n.* } This seems a sufficiently atisfactory derivation; but Junius chooses to go rther a field, and makes Καρκαιρω the parent ord, though with no small portion of etymolo- cal distortion. *Carc* in the Welsh means care, licitude, anxiety; *carcus*, solicitous, anxious, reful. The sense of the English word is the me. Cark as a noun is obsolete; the verb is arly so, and is always used in an ill sense. nconnected with this, and whence derived I ow not, is carke; denoting, says Minsheu, 'a antity of wool, whereof thirty make a sarpler,' ual to half a sack.

What pathe liste you to treade ? what trade will you assay ?
e courts of plea by braule and bate drive gode peace away.

In house for wife and childe there is but *carke* and care,
With travel and with toyle enough in fields we used to fair. *Man's Life; in Uncertaine Auctors.*

He down did lay
His heavy head, devoid of careful *cark*
Spenser.

And Klaius taking for his younglings' *carke*,
Lest greedy eyes to them might challenge lay,
Busy with oker did their shoulders mark.
Sidney.

Hark, my husband, he's singing and hoiting;
And I'm fair to *carke* and care, and all little enough.
Beaumont and Fletcher.

What can be vainer, than to lavish out our lives in the search of trifles, and to lie *carking* for the unprofitable goods of this world? *L'Estrange.*

CA'RLE, *v.* & *n.*
CA'RLISH, *adj.*
CA'RLISHNESS, *n.*
CA'RLOT, *n.*
} Goth. *karl*, in which language it meant simply a man; Welsh, *carl*, a covetous man; Ang.-Sax. carl, a miser, a rustic, a male. Its usual acceptation, in English, is a mean, uncivilised, rough, brutal, man. In England this word is now superseded by churl it still obtains in Scotland. Carle, Johnson tells us, is also the name of a kind of hemp. Tusser has 'the fimble, to spin, and the carl for her seed;' from which it is evident that carle is female hemp. Carlot signifies a countryman, says Todd; and in the quotation from Shakspeare it undoubtedly is so, but it will not bear such a construction in the extract from Drayton, the person there alluded to being a peer.

His knave was a strong *carle* for the nones,
And by the haspe he haf it of at ones;
Into the flore the dore fell anon.
Chaucer. Cant. Tales.

Right in the midst, whereas they breast to breast,
Should meet a trap was letten downe to fall
Into the floud; straight leapt the *carle* unblest,
Well weening that his foe was falne withall;
But he was well aware and lept before his fall.
Spenser.

The next year Hardicanute sending his house *carles*, so they called his officers, to gather the tribute imposed; two of them rigorous in their office were slain at Worcester by the people; whereat the king enraged sent Leofric, duke of Mercia, and Seward of Northumberland, with great forces and commission to slay the citizens, rifle and burn the city, and waste the whole province. *Milton. Hist. of Eng.*

Answer, thou *carle*, and judge this riddle right,
I'll frankly own thee for a cunning wight. *Gay.*

The editor was a covetous *carle*, and would have his pearls of the highest price. *Bentley.*

CARLEBY, OLD AND NEW, two towns on the coast of West Bothnia, about fifty miles north of Wasa.

CARLETON (George), a learned bishop of the seventeenth century, born at Norham, in Northumberland, in 1559. He was principally indebted for his education, both at school and at the university, to the liberality of Bernard Gilpin. Upon quitting the university, he was advanced, in 1617, without any previous ecclesiastical preferment, to the bishopric of Llandaff. He was a person of solid judgment, and various reading. To the papists he was a bitter foe and with regard to the doctrine of predestination, a rigid Calvinistn. He published many works, both in English and Latin, the principal among which are his Heroici Characteres, or Heroic Characters, Oxon. 4to. 1603; Tythes Examined, and proved to be due to the Clergy by a Divine Right, Lond. 4to. 1606–1611; Jurisdiction Royal, Episcopal and Papal, wherein is declared how the Pope hath intruded upon the jurisdiction of temporal princes, and of the church, &c. Lond. 4to. 1610; Astrologimania, a treatise against Judicial Astrology, 4to. 1624; Vita Bernardi Gilpin, 4to. 1626; this work was translated into English in 1629. He sat in the Short Parliament, for Arundel in Sussex.

CARLINA, the carline thistle: a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ: CAL. is radiated with long colored marginal scales. There are twelve known species. C. vulgaris is the only one that is a native of Britain. All the others are natives of the south of France or Italy; and are very easily propagated in this country by seeds, which must be sown on a bed of fresh undunged earth, where they are to remain, as they do not bear transplanting. The second year most of them will flower; but rarely produce good seeds in this country, and some of the plants decay soon after they have flowered, so that it is difficult to maintain them here. The roots are used in medicine, and for that purpose are imported. As we receive them they are about an inch thick, externally of a rusty brown color corroded as it were on the surface, and perforated with numerous small holes, appearing as if worm eaten. They have a strong smell, and a sub-acid, bitterish, weakly aromatic taste. They are reckoned warm alexipharmics and diaphoretics. Hoffman the Elder relates that he has observed a decoction of them in broth occasion vomiting. They have been for some time greatly esteemed among foreign physicians; but never were much in use in this country. The present practice entirely rejects them, nor are they often to be met with in the shops.

CARLINE KNEES are timbers going athwart a ship, from the sides to the hatch-way, serving to sustain the deck on both sides.

CARLINGFORD, a populous parish and town in the county of Louth, Ireland. The parish comprises a promontory between Dundalk and Carlingford Bay. The town is situate on the south shore of the bay of Carlingford, and is noted for its oyster fishery; it is a corporate town, and returns two members to the Irish parliament. It is eight miles south of Newry, and fifty-two north of Dublin.

CARLINWARK LOCH, a lake in Kirkcudbrightshire, originally 116 square acres in extent; but reduced in 1765 to eighty, ten feet of water being then taken off by a canal to the Dee. It is a great source of improvement to the adjacent grounds, as it contains an inexhaustible fund of the very best shell marl. It was sold in 1788, for £2000 sterling. Before it was drained there were two isles in it, at the north and south ends, on which water fowls bred in great abundance. Many antiquities were found in it, particularly a brass dagger, plated with gold, twenty-two inches long, and several canoes hollowed out like those of the American Indians.

CARLISLE, a city, bishop's see, and capital of the county of Cumberland, England, is situate at the junction of three rivers, Calder, Petterill, and Eden, about six miles above the entrance of the united streams into Solway Frith, and thirteen miles from the south-west frontier of Scotland. Carlisle has held a distinguished rank among the cities of England, in every period of British history, and is supposed to have been first founded by Luil, a native Briton, long before the irruption of the Romans into England. The contiguity of Carlisle to Scotland, during the less social habits, and distinctiveness of interest, of the people of that country, frequently exposed it to their depredations; to avoid which, the Romans, on their possessing themselves of this part of England, erected a wall from Solway Frith to the German Ocean, which included on one side Carlisle, and on the other, Newcastle within its southern limits. After the departure of the Romans from England, the Roman wall did not prevent the Scots and Picts from renewing their incursions, and they soon reduced Carlisle to a heap of ruins, in which state it continued till 680, when Egbert king of Northumberland encompassed it with a wall, and repaired its church; but it was again doomed to destruction in the eighth and ninth centuries, by the Norwegians and Danes, and it remained in this state until after the Norman conquest, when it was further protected by a citadel and castle, built by William Rufus, having three gates, called the English, Irish, and Scotch, with reference to their bearing on the side of each respective country. These defences, however, did not prevent it from falling into the possession of the Scots, who held it alternately with the English from the period of William Rufus, to that of Henry VII. It was constituted a bishop's see by Henry I., destroyed by fire by the Scots, in the reign of Henry III., and experienced the same disaster twice in the following reign. In 1568 the castle was made the prison house of the unfortunate Mary of Scotland; in 1645 it surrendered, through famine, to the parliamentary force; and in 1745 fell into the possession of the partizans of the Pretender, but was immediately after retaken by the duke of Cumberland, who demolished the gates and part of the wall; and it has since that period enjoyed an uninterrupted tranquillity. Since the commencement of the present century, it has undergone great improvements: and on the site of the citadel two commodious courthouses have been erected, the county gaol rebuilt, a handsome stone bridge built over the Eden, with other improvements have contributed to render it one of the most agreeable and interesting cities of England. The castle is still kept in repair, and serves, with other purposes, for a magazine, and an armoury of about 10,000 stand of arms. The cathedral is a stately and venerable edifice, partly of Saxon and partly of Gothic architecture; there are two other churches, as well as several meeting houses. The markets, on Wednesdays and Saturdays, are well supplied with every thing necessary for subsistence and comfort. The cotton manufacture has established itself upon an extended scale in this city, whilst the architectural and external appearances of the city have indicated great social improvement and national prosperity. The conveyance of its commodities of commerce has been facilitated by a canal to the Solway Frith, and it is a point of union and interchange for the mails to all parts of England, Scotland, and Ireland. Its corporation consists of a mayor, twelve aldermen, &c. It returns two members to parliament, and is 101 miles south-east of Glasgow, ninety-one south by east of Edinburgh, and 303 N. N. W. of London.

CARLISLE, a town of Schoarie county, state of New York. Population in 1820, 1583; forty miles west of Albany.

CARLISLE, a town of Pennsylvania, capital of Cumberland county, with a college, and four edifices for public worship. It is situate near a creek of the Susquehannah, 100 miles west by north of Philadelphia.

CARLISLE BAY, on the south coast of Jamaica; west coast of Barbadoes, and island of Antigua.

CARLISLE (Frederic Howard), earl of, was born in May 1748, his mother being Isabella Byron, sister of Admiral Byron, whose life we have sketched. He was brought up at Eton with Mr. Fox; and finished his education at Christ Church, Oxford. In 1777 he was appointed treasurer of the royal household, and appointed in the following year one of the British commissioners to adjust the differences between the mother country and her then revolted American colonies: but the mission, it is well known, proved wholly abortive. In 1780 he was viceroy of Ireland. As a writer he is known by a tragedy called the Father's Revenge, which received the decided approbation of Dr. Johnson, the Stepmother, a tragedy, and some Poems. His nephew, Lord Byron, as we have shown, treated the poetical character of this nobleman with great contempt in his English Bards and Scotch Reviewers: but there was evidently more of private pique in the affair, than any steadiness of judgment. See BYRON. Lord Carlisle married a daughter of the marquis of Stafford, by whom he had a son, born in 1773. The countess died January 27th, 1824; and the earl, September 4th, 1825.

CARLOCK, in commerce, a sort of isinglass, made of the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but it is also used by the dyers. The best carlock comes from Astracan, where great numbers of the fish are caught.

CARLOS, ST., a city in the interior of the new Colombian province of Apure, situate on one of the branches of the Apure river, about eighty-five miles S. S. W. of Valencia. The inhabitants are principally descendants of settlers from the Canary Isles, who are more industrious and social than those from Old Spain. Under the newly formed government of Colombia, St. Carlos promises to become a flourishing place, being situate in a very fertile country, affording great inducements to agricultural enterprise. Population in 1826, about 10,000.

CARLOS DE MONTEREY, SAN, the principal settlement of New California, on the west coast manufacture has established itself upon an extended scale in this city, whilst the architectural and external appearances of the city have indicated great social improvement and national prosperity. The conveyance of its commodities of commerce has been facilitated by a canal to the Solway Frith, and it is a point of union and interchange for the mails to all parts of England, Scotland, and Ireland. Its corporation consists of a mayor, twelve aldermen, &c. It returns two members to parliament, and is 101 miles south-east of Glasgow, ninety-one south by east of Edinburgh, and 30 N. N. W. of London.

CARLISLE, a town of Schoarie county, state of New York. Population in 1820, 1583; forty miles west of Albany.

CARLISLE, a town of Pennsylvania, capital of Cumberland county, with a college, and four edifices for public worship. It is situate near a creek of the Susquehannah, 100 miles west by north of Philadelphia.

CARLISLE BAY, on the south coast of Jamaica; west coast of Barbadoes, and island of Antigua.

CARLISLE (Frederic Howard), earl of, was born in May 1748, his mother being Isabella Byron, sister of Admiral Byron, whose life we have sketched. He was brought up at Eton with Mr. Fox; and finished his education at Christ Church, Oxford. In 1777 he was appointed treasurer of the royal household, and appointed in the following year one of the British commissioners to adjust the differences between the mother country and her then revolted American colonies: but the mission, it is well known, proved wholly abortive. In 1780 he was viceroy of Ireland. As a writer he is known by a tragedy called the Father's Revenge, which received the decided approbation of Dr. Johnson, the Stepmother, a tragedy, and some Poems. His nephew, Lord Byron, as we have shown, treated the poetical character of this nobleman with great contempt in his English Bards and Scotch Reviewers: but there was evidently more of private pique in the affair, than any steadiness of judgment. See BYRON. Lord Carlisle married a daughter of the marquis of Stafford, by whom he had a son, born in 1773. The countess died January 27th, 1824; and the earl, September 4th, 1825.

CARLOCK, in commerce, a sort of isinglass, made of the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but it is also used by the dyers. The best carlock comes from Astracan, where great numbers of the fish are caught.

CARLOS, ST., a city in the interior of the new Colombian province of Apure, situate on one of the branches of the Apure river, about eighty-five miles S. S. W. of Valencia. The inhabitants are principally descendants of settlers from the Canary Isles, who are more industrious and social than those from Old Spain. Under the newly formed government of Colombia, St. Carlos promises to become a flourishing place, being situate in a very fertile country, affording great inducements to agricultural enterprise. Population in 1826, about 10,000.

CARLOS DE MONTEREY, SAN, the principal settlement of New California, on the west coast

of North America, in the lat. of 36° 36′ N., and 121° 34′ of W. long. It is beautifully situated within a small bay of the same name, first discovered by Cabrillo in 1542, who named it Bahia de Pinos, on account of the graceful aspect of the forest of pines, intermixed with oaks, which covered the mountains of St. Lucia, rising with gentle ascent from the bay. It was afterwards visited by the Count de Monterey, from whom it received its present name. The Jesuits in their turn became enamoured with the spot, and formed a settlement here. The forests and mountains which rise immediately from the coast, preclude much intercourse with the interior; nor does it appear that there is any river of magnitude, either north or south, for some distance, otherwise it would be an inviting spot for colonisation.

CARLOW, anciently called Catherlogh, an interior county of the province of Leinster, in the south-east part of Ireland; it is bounded on the west by the Barrow River, which divides it from the county of Kilkenny, afterwards flowing past New Ross into Waterford harbour; on the east it is intersected by the Slaney River, which falls into Wexford Haven; a small portion of the county lies west of the Barrow, and the portion east of the Slaney borders on the county of Wicklow, and partakes of the mountainous character of that county, as does also the portion west of the Barrow, and the south-east part bordering on the county of Wexford; the part between the two rivers is beautifully undulated and exceedingly fertile, both in tillage and pasture, and produces the best butter in all Ireland. It contains inexhaustible quarries of excellent limestone, and beds of marl and clays, and in the mountains are iron ore and oxide of manganese. Carlow county contains 137,050 Irish plantation acres; is divided into six baronies and forty-six parishes. The only towns of note in the county, besides Carlow, the capital, are Tullow and Hacket's Town; in that part of the county west of the Barrow is the ecclesiastical see of Leighlin, now united to Ferns in the county of Wexford.

CARLOW, the chief and assize town of the preceding county, is situate on the east bank of the Barrow River, at the north-west extremity of the county, bordering on Queen's and Kildare counties. The remains of a castle overhanging the river, the ruins of a very fine abbey, a convent, and Roman Catholic college, are the principal objects of interest in the town. It has also a respectable market-house, county court-house, gaol, and cavalry barracks, and manufactures some woollen cloths. The castle is supposed to have been erected by king John of England, to secure the passage of the Barrow; it continued for several centuries a fortress of much importance. In the reign of Richard II. it was surprised by Donald M'Art O'Kavanagh, king of Leinster, and remained in his possession a considerable time. In 1577 the tower and castle surrendered, after a long and desperate siege, to Rory Oge O'Moore, who inflicted great cruelty on the inhabitants. In 1642, 500 Englishmen, imprisoned in the castle, were rescued by a detachment of the duke of Ormond's army; and in 1650 it surrendered to the parliamentary forces. In an effort since that time to renovate the building, the foundation gave way, and it has since remained a heap of ruins. On the 27th of May, 1798, the town was furiously assailed at two o'clock in the morning, by a large body of Irish, who, after a most sanguinary conflict, were routed by the English cavalry stationed in the barracks, aided by the yeomanry. Some coarse woollen cloth is manufactured in the town and its vicinity; some of the inhabitants carry on, by means of the Barrow, an extensive traffic in lime, and stone coal, obtained just within Queen's county. Carlow is one of the thirty-one places in Ireland each of which returned a member to the parliament of the United Kingdom. It is eighteen miles north-east of the city of Kilkenny, and thirty-nine south-west of Dublin.

CARLOWITZ, a town of Sclavonia, where a peace was concluded between the Turks and Germans in 1669. It is seated on the south bank of the Danube, just below Peterwarden, thirty-eight miles north-west of Belgrade. Population about 5600

CARLSBAD, a town of Bohemia, in the circle of Saatz, celebrated for its hot baths, discovered by the emperor Charles IV. as he was hunting. It is seated on the Topel, near its confluence with the Egra, twenty-four miles E. N. E. of Eger, and seventy south-east of Dresden. It is very celebrated for its mineral waters.

CARLSCRONA, or CARLSCROON, a sea-port of Sweden, in the province of Blekingen, on the Baltic. It is the residence of the governor of the province, and was founded by Charles IX; but, for its present rank as a sea-port, is indebted to Charles XI. It has long been the principal rendezvous of the Swedish navy. The harbour is commanded by two forts, and other fortifications; but the docks are the chief objects of interest. One of them, constructed in the year 1714, was excavated from the solid rock; its length is 190 feet, its breadth forty-six, and its depth thirty-three. The new semicircular dock is of greater dimensions; it is divided into four compartments, each of which has five slips for vessels, a gate forty-eight feet in width, and nearly thirty in height, and an edifice over it with a copper roof. The walls are of granite, and nearly forty feet thick, being filled up in the middle with earth. The harbour will hold altogether about 100 vessels. The Swedish admiralty had once its seat here, but removed to Stockholm in 1776. Here is an anchor foundry. The exports are timber, tar, potash, tallow, and marble. Population 13,800. It is 220 miles S. S. W. of Stockholm.

CARLSHRUE, a town in the northern part of the territory of the grand duke of Baden, and now the ducal residence. It was first laid out in 1715; the original plan included thirty-two streets, and a palace in the centre. It was taken possession of by the French in 1796, when only nine of the streets were built; nor was it of much note till after the final termination of the war in 1814: since which it has become the permanent residence of the grand duke. The palace is a spacious and elegant edifice, the centre surmounted with a lofty spire; on one side is a chapel, and on the other a library, containing 40,000 volumes of valuable books, and a collection of minerals and medals. A philosophical apparatus, and an extensive botanic garden, adjoins the palace. Carlshrue has churches for the Lutherans, Calvinists, and Catholics; and also a Jews' synagogue; all religionists being on equal terms in the Baden territory. The other public buildings are a town hall, courts, an academy, poor-houses, and barracks; and most of the buildings, private as well as public, being of stone, the whole make a respectable, and rather an imposing appearance. The chief dependence of the inhabitants is on the court, and public business of the dukedom, and foreign embassies. The population has been progressively increasing since 1810, and in 1825 amounted to 16,030. It is about forty miles north by east of Strasburgh, and about the same distance west by north of Stutgard.

CARLSTADT, a town of Franconia, in the principality of Wurtzburg, seated on the Maine, thirteen miles north by west of Wurtzburg. It is now included in the Bavarian circle of the Lower Maine. Population about 2200.

Carlstadt, the capital of Croatia, with a fortress; seated on the Kulpa, a branch of the Save, at the influx of the Corona, 180 miles south by west of Vienna, and forty-five E. N. E. of Fiume.

Carlstadt, a town of Sweden, capital of Wermeland, and a bishop's see. It stands on the north side of the lake Wenner, and on the island of Tingwalla, which is formed by two branches of the Clara. The houses are built of wood and painted; the episcopal palace is also of wood, and has an extensive front. The inhabitants carry on a trade in copper, iron, and wood, across the lake. It is 155 miles west of Stockholm. Population about 1500.

CARLYLE (Joseph Dacres), an English divine, famous for his oriental learning, was born at Carlisle in 1759, where his father practised physic with considerable reputation. After receiving the usual course of grammar-school education in Carlisle, he was removed to Christ's College, Cambridge; and having resided about two years there, he was admitted of Queen's College, and obtained a fellowship. He now began to study the Arabic language, in which he made uncommon progress; and, with the assistance of David Zabio, an Asiatic, born at Bagdad, then residing at Cambridge, he entered on the study of the other oriental tongues. Having continued about ten years in college, during which he proceeded to his degree of B. D., he married and settled at Carlisle. He was chosen professor of Arabic on the resignation of Dr. Craven in 1794; and collated to the chancellorship of Carlisle in 1795. In 1796 he published Specimens of Arabian Poetry, with elegant translations, and brief memoirs of the authors. In 1799 he accompanied lord Elgin in his embassy to Constantinople; where he gained admittance to the libraries, and made catalogues of the works they contained; and from whence he made excursions into Asia Minor, and explored, with interesting accuracy, the site of ancient Troy. Having visited Egypt, Syria, and the Holy Land, gleaning literary treasures wherever he went, he returned to Constantinople, from whence he travelled through Italy and Germany to England, where he landed in the end of 1801. The bishop of Carlisle soon after presented him to the rich rectory of Newcastle upon Tyne; but his travels had injured his constitution, and this worthy and ingenious man died at Newcastle in 1804. About the time of his death he was engaged in superintending an edition of the Arabic Bible; a Dissertation on the Troad; and Observations made during his Tour in the East.

CARMAGNOLA, a fortified town of Italy, in Piedmont. It was taken by the French, and retaken by Prince Eugene in 1691. It is seated in a country abounding in corn, flax, and silk, near the Po. Here is an annual fair, which is much frequented from Savoy and Dauphiné. Early in the revolution it fell into the hands of the French, and gave its name to one of the most popular republican songs. Population about 12,000. It is twelve miles S. S. E. of Turin.

CARMANIA, in ancient geography, a country of Asia, east of Persia, having Parthia on the north, Gedrosia on the east, the Persian Gulf, and the Indian, or the Carmanian, Sea on the south. Its name was derived from the Syriac, carma, a vine, for which it was famous, yielding clusters of grapes three feet long. It is now called Kerman, or Carimania, and is a province of modern Persia. It was anciently divided into Carmania Deserta, south of Parthia; and, Carmania Propria, south of Carmania Deserta, quite to the sea.

CAERMARTHEN, or Carmarthen, the chief town in the county of Caermarthen, South Wales, situated at the distance of 218 miles west of London. It is also a borough containing a population of 9995 souls, holds markets every Wednesday and Saturday, and fairs on the 3rd and 4th of June, 10th of July, 12th of August, 9th of October, and 14th of November. The chancery and exchequer for South Wales were established here, and here the ancient Britons held their patriarchal synods. — The present town occupies a commanding position on the northern bank of the river Towy, which is crossed by a bridge of seven arches; and the bay of Caermarthen into which the river falls, is included between Caldy Island and the Worm's Head, distant from each other just fourteen miles.—Henry VIII. granted the inhabitants the privilege of being represented in parliament. The corporation consists of a mayor, recorder, town clerk, six peers, and two sheriffs, the last being the returning officers at the elections for appointing a burgess to parliament. The great sessions for the county are held here, as well as a mayor's court, and quarter sessions alternately, with Llandilo. The trade consists principally in the manufacture and export of tin, coal, and iron, and an extensive and improving traffic is established between this town and Bristol. The Towy is navigable up to the town by vessels of 300 tons burden; and the quay is spacious and convenient. Amongst its public buildings the most important are the church of St. Peter, a chapel of ease, besides meeting houses, the county gaol, town hall, &c.

Caermarthen boasts the possession of several literary societies, and two public journals issue from its press. A handsome monument to the memory of the gallant Sir Thomas Picton stands near the town; and that remarkable person Merddyn, or Merlin, the prophet, was born here. He flourished, A. D. 480, and has left the name of Caer-merddyn (Caermarthen) i. e. the city of Merlin, to fix the place of his nativity.—The duke of Leeds takes the title of marquis from this place.

CAERMARTHENSHIRE, one of the six counties comprehended within South Wales. It was anciently called Dimetia, and is bounded on the north by Cardiganshire, on the east by Brecon, on the west by Pembroke, and the south by Glamorganshire and the Bristol channel. The surface presents considerable variety, undulating generally, sometimes very hilly, and, occasionally, even swelling into mountains. The area covers 590,640 acres, which sustain a population of 100,800. It is separated into eight hundreds, viz.: Carnwallon, Cathinog, Caeo, Derllys, Elvet, Iskennen, Cidwelly, and Perfedd. In these are the market towns of Caermarthen, the capital, Llandovery, Cidwelly, Llandeilo fawr, Llanelly, Newcastle-in-Emlyn, and Llangadoc. There are eighty-seven parishes within the shire, all under the control of the diocese of St. Davids. Tin plates and woollen stockings are amongst the manufactures, the latter disposed of in every market town, the former shipped principally at Llanelly. Many British and Roman antiquities are scattered over the face of the county, and some few places are consecrated to history and poetry. Grongar hill possesses a classical notoriety, and Llandeilo fawr witnessed the fall of Cambrian independence in the final struggle between Llewellyn and King Edward I., of England. An ancient Roman road is still distinct near to Llandovery, and many coins of that victorious people have been found in the vicinity of Whitland and elsewhere. Llanegwad parish abounds in antique remains, both Roman and British, and to the north of the town of Caermarthen stands a remarkable cairn, 150 feet in circumference, and eighteen in height, enclosing a stone chest nine feet in length, the lid of which is entire. Other cairns of less magnitude, but containing sepulchral remains, have also been met with in other places in this county. Caermarthen borough sends one member to parliament, and a second is returned by the county.

CARMEL, a high mountain of Palestine, standing on the skirts of the sea, and forming the most remarkable head-land on all that coast. It extends east as far as the plain of Jezreel, and from the city of that name quite to Cæsarea on the south. It seems to have had the name of Carmel from its great fertility; this word, in Hebrew, signifying the vine of God, and being used in Scripture to denote any useful spot. Carmel has been greatly revered both by Jews and Christians, from its having been the residence of the prophet Elijah, who is supposed to have lived there in a cave (which is there shown) before he was taken up into heaven.

CARMELITES, one of the four tribes of mendicant friars; so named from mount Carmel. They pretend to descend in an uninterrupted succession from Elijah, Elisha, and the sons of the prophets. Phocas, a Greek monk, speaks the most reasonably. He says that in his time, 1185, Elias's cave was still extant on the mountain; near which were the remains of a building, which intimated that there had been anciently a monastery; that some years before, an old monk, a priest of Calabria, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers. In 1209 Albert, patriarch of Jerusalem, gave the solitaries a rigid rule, which Papebroch has since printed. This rule contained sixteen articles. These confined them to their cells; enjoined them to continue day and night in prayer; prohibited their having any property; enjoined fasting from the feast of the holy cross till Easter, except on Sundays; abstinence at all times from flesh; obliged them to manual labor; imposed a strict silence on them from vespers till the tierce the next day. After the establishment of the Carmelites in Europe, their rule was in some respects altered; the first time, by pope Innocent IV., who added to the first article a precept of chastity, and relaxed the eleventh, which enjoins abstinence at all times from flesh, permitting them, when they travelled, to eat boiled flesh. The rule was again mitigated by the popes Eugenius IV., and Pius II. The habit of the Carmelites was at first white, and the cloak laced at the bottom with several lists. But Pope Honorius IV. commanded them to change it for that of the Minims. Their scapulary is a small woolen habit of a brown color, thrown over their shoulders. They wear no linen shirts; but instead of them linsey wolsey, which they change twice a week in the summer and once a week in the winter.

CARMEN, an ancient term among the Latins, used in various senses; as 1. a verse: 2. a spell, charm, form of expiation or execration, couched in few words, in a mystic order, on which its efficacy depended.

CARMENTA, or Carmetis, in fabulous history, a prophetess of Arcadia, and the mother of Evander, with whom she came into Italy sixty years before the Trojan war.

CARMINATIVES comprehend coriander-seeds, aniseed, peppermint, and the like medicines, used in colics, or other flatulent disorders, to dispel wind. The word comes from the Latin carmen, a charm; and is supposed to have been a general name for all medicines which operated, like charms, in an extraordinary manner. Hence, as the most violent pains frequently arose from wind, and immediately ceased upon its dispersion, the term carminative was applied to medicines which gave relief in windy cases, as if they cured by enchantment. It is now almost obsolete.

CARMINE, a powder, of a very beautiful red color, partaking of the shades of scarlet and purple. It is used by painters in miniature; but, on account of its high price, they are often induced to substitute lake. The manner of producing it is preserved a secret by color-makers; and, though many receipts have been published, none has ever been found to answer the purpose. See Painting.

CAR'NAGE, *n.*
Car'nal, *adj.*
Car'nalist, *n.*
Car'nalite, *n.*
Carnal'ity, *n.*
Car'nalize, *v.*
Car'nally, *adj.*
Car'nalness, *n.*
Car'nal-minded, *adj.*
Car'nal-mindedness, *n.*

This whole class of words descends from Lat. *caro, carnis*, flesh. Carnage means slaughter; massacre; and also, poetically, heaps of flesh. Carnal, and the words formed from it, denote belonging to the flesh; addicted to fleshly practices; unspiritual; sensual; gross; and in their worst sense, libidinous, lustful, lecherous. A carnalite is a worldly-minded man; a carnalist seems to be some shades darker in character; to carnalise is to degrade the mind by employing it in ministering only to the lusts of the flesh; reducing it to that state in which, as Milton beautifully expresses it,

> The soul grows clotted by contagion,
> Imbodies and imbrutes, till she quite lose
> The divine property of her first being.

> For to be *carnally-minded* is death; but to be spiritually minded is life and peace. Because the *carnal* mind is enmity against God: for it is not subject to the law of God, neither indeed can be.
> *Romans* viii. 7.

> So as fortune wold that was Isopes frend,
> This worthy king that same yere made his *carnal* end.
> *Chaucer. Cant. Tales.*

CARNARVON, a town in the parish of Llanbeblig, hundred of Is-gorfai, and county of Caernarvon, in North Wales. It is a borough town, the capital of the county, and of the northern principality, and is beautifully situated at the confluence of the river Seiont with the straits of Menai. Here are held the great and quarter sessions. Markets on Wednesdays and Saturdays, and five fairs in each year. It lies 235 miles north-west by west of London. The population is estimatedat 5,788. The public buildings are not architectural although convenient. The hotel is a handsome design, and the English chapel appropriate, but the county court, market house, gaol, and custom house, have only the excellence of their accommodation to recommend them. The guild, or town hall, is a handsome apartment occupying the ancient flanking towers of the principal gate. It was restored and decorated at the expense of Sir Watkyn Williams Wynne, bart. Three excellent and spacious inns are provided for the accommodation of visiters, exclusive of several comfortable houses of less pretensions. The domestic or country trade of this town is considerable, but its prosperity and wealth are attributable to the large exports of slate made annually from the quays. The metal of Cylgwyn and Llanllyffni quarries is superior to the smooth pink slate exported from other places, a circumstance seldom known beyond the vicinity of the slate country. Ships are repaired here, and vessels occasionally built, a trade much promoted by the advantage of a patent slip. The noble castle of Caernarvon, the birth place of Edward II. is the most spacious and elegant of the first Edward's military structures, being intended for the residence of the royal family. It appears as a figure-head of the harp-like form into which the ancient walls are disposed, a design artfully adopted, like the accouchement of Queen Eleanor in Caernarvon castle, to soothe and win over his lately conquered subjects. Caernarvon is governed by a mayor, who is constable of the castle, by patent, one alderman, and two bailiffs, &c., and, in conjunction with Pwllheli and other ancient places, returns one member to parliament. Near the site of King Edward's fortifications stood the ancient Roman Segontium, some small remains of which still exist, a Roman road may also be traced, and several camps or stations are yet quite perfect at small distances around. *Plas Mawr*, within the walls, a mansion belonging to one of the earliest Saxon settlers walls, may be classed amongst the antiquities. The Herbert family take the title of earl from this ancient town.

CARNARVONSHIRE, a county of North Wales. It is bounded by the sea on the north, by Denbighshire on the east, by Merionethshire and the sea on the south, and on the west by the Menai straits and the Irish Sea. It extends forty five miles in length, but varies exceedingly in breadth, and occupies an area of 260,000 acres of land. It is divided into ten hundreds, viz.: Commitmaen, Creuddyn, Dinllaen, Effionydd, Gafflogian, Isaf, Is-gorfai, Nant-Conway, Uchaf, Uwch-gorfai, and the separate jurisdiction of Bangor city. It includes the market towns of Caernarvon, Pwllheli, and Nevin, and embraces seventy-one parishes, subject to the control of the bishop of Bangor. The population is estimated at 66,500. This is one of the most mountainous and romantic districts in the United Kingdom, and here the great chain of mountains, which appears to rise from the sea at Penmaen-mawr and the Rifaels, attains its maximum height, 3759 feet in the summit of Snowdon, the loftiest of the Cambrian Alps. The general composition of the Caernarvonshire hills is clay slate, including copper and lead ores, the principal mines of which are situated at Llanberis, Nantle-pooles, and Beddgelert, besides pure slate at Llandegai, Llanberis, Llanllyffni, and other places. In the export of slates, ores, light cattle, and some woollen, the chief trade consists, and the accommodation of tourists forms a profitable occupation to numbers. Many rivers and rivulets descend from the mountains, and either proceed with short courses to the sea or meander into the adjoining counties. The Conway is the most important, and perhaps the next in magnitude are the Ogwen, Llugwy, Lleder, Seiont, and Coluryn. Lakes are also numerous, almost every hollow amongst the hills constitutes a draining reservoir of an extensive district. Llanberis and Nantgwynant lakes are celebrated for the sublimity of the accompanying scenery, to which may be added, as not inferior in grandeur, Llyn Idwal, Ogwren, and Crafnant. Strangers have been admitted to an inspection of the wildest districts of this county by the construction of excellent roads through Llanberis and Nant Francon, and a free intercourse is opened with Anglesea by the erection of the Menai suspension bridge. The remains of antiquity are various and many. The of the harp-like form into which the ancient walls are disposed, a design artfully adopted, like the accouchement of Queen Eleanor in Caernarvon castle, to soothe and win over his lately conquered subjects. Caernarvon is governed by a mayor, who is constable of the castle, by patent, one alderman, and two bailiffs, &c., and, in conjunction with Pwllheli and other ancient places, returns one member to parliament. Near the site of King Edward's fortifications stood the ancient Roman Segontium, some small remains of which still exist, a Roman road may also be traced, and several camps or stations are yet quite perfect at small distances around. Plas *Mawr*, within the walls, a mansion belonging to one of the earliest Saxon settlers walls, may be classed amongst the antiquities. The Herbert family take the title of earl from this ancient town.

CARNARVONSHIRE, a county of North Wales. It is bounded by the sea on the north, by Denbighshire on the east, by Merionethshire and the sea on the south, and on the west by the Menai straits and the Irish Sea. It extends forty five miles in length, but varies exceedingly in breadth, and occupies an area of 260,000 acres of land. It is divided into ten hundreds, viz.: Commitmaen, Creuddyn, Dinllaen, Eifionydd, Gafflogian, Isaf, Is-gorfai, Nant-Conway, Uchaf, Uwch-gorfai, and the separate jurisdiction of Bangor city. It includes the market towns of Caernarvon, Pwllheli, and Nevin, and embraces seventy-one parishes, subject to the control of the bishop of Bangor. The population is estimated at 66,500. This is one of the most mountainous and romantic districts in the United Kingdom, and here the great chain of mountains, which appears to rise from the sea at Penmaen-mawr and the Rifaels, attains its maximum height, 3759 feet in the summit of Snowdon, the loftiest of the Cambrian Alps. The general composition of the Caernarvonshire hills is clay slate, including copper and lead ores, the principal mines of which are situated at Llanberis, Nantle-pooles, and Beddgelert, besides pure slate at Llandegai, Llanberis, Llanllyffni, and other places. In the export of slates, ores, light cattle, and some woollen, the chief trade consists, and the accommodation of tourists forms a profitable occupation to numbers. Many rivers and rivulets descend from the mountains, and either proceed with short courses to the sea or meander into the adjoining counties. The Conway is the most important, and perhaps the next in magnitude are the Ogwen, Llugwy, Lleder, Seiont, and Colwyn. Lakes are also numerous, almost every hollow amongst the hills constitutes a draining reservoir of an extensive district. Llanberis and Nantgwynant lakes are celebrated for the sublimity of the accompanying scenery, to which may be added, as not inferior in grandeur, Llyn Idwal, Ogwen, and Crafnant. Strangers have been admitted to an inspection of the wildest districts of this county by the construction of excellent roads through Llanberis and Nant Francon, and a free intercourse is opened with Anglesea by the erection of the Menai suspension bridge. The remains of antiquity are various and many. The

Cairn, Cromlech, and Roman camp are still distinguishable. Ancient British castles remain at Dolwydellan, Nant Francon, Criccieth, and Dolbadarn, while the noble ruins of Caernarvon and Conway castles evince the power and resources of the English prince by whom Cambria was finally subdued.

CARNATIC, a territory of Hindostan, extending along the east coast from Cape Comorin, the southern extremity of Asia, in 8° 4′ N. lat. to near the mouth of the Kistna in 16° N. lat. varying in breadth from fifty to 100 miles, bounded on the west by the Mysore, and on the east for about two degrees of latitude, by the gulf of Manara and Palk's Strait, which divides it from the north end of the island of Ceylon, the remainder of its eastern boundary being better known by the name of the coast of Coromandel. The principal towns on the coast, beginning from the south, are Negapatam, Pondicherry, Madras, Pullicat, and Gangapatam; and those in the interior, beginning also from the south, are Tinevelly, Madura, Tritchinopoly, Tanjore, Arcot, Nellore, and Ongole. Numerous streams and rivers from the westward intersect this territory, the principal of which are the Cauvery, Cuddalore, Paliare, and Pennar. The soil is various in quality, being in some places exceedingly fertile, and in others sandy and barren; and the inhabitants occasionally exposed to great privation for want of water. Numerous fortresses, and monuments of art, are spread over every part of this territory, indicating long continued civilisation and opulence, more so than in most other parts of Hindostan. The Carnatic was formerly the dominion of the nabob of Arcot, who became one of the earliest and apparently most faithful allies of the British in their career of conquest in the east. The nabob of Arcot's dominions were guaranteed to him, on condition of paying a subsidy of fifteen lacks of pagodas annually, afterwards reduced to nine lacks, and further not to enter into alliance with any European or other power, without the consent of the British. But, on the surrender of Seringapatam to the British in 1800, there was found, among the records of the sultan, papers confirmatory of the secret violation of the treaty of the nabob of Arcot with the British, who consequently dispossessed the nabob of his authority, and since 1801 the Carnatic has been uninterruptedly possessed by the British, and included in the presidency of MADRAS, which see.

CARNA'TION, *n.s.* } Fr. *incarnadin*; Ital.
CARNA'TIONED, *adj.* } *incarnatino*, *incarnato*; Span. *encarnado*; Lat. *caro*, *carnis*. The natural flesh color; the name of a flower. The adjective denotes colored like the flower. When the flesh is well executed, and has the natural tint, painters say, 'the carnation is very good.'

And lo the wretch! whose vile, whose insect lust
Laid this gay daughter of the spring in dust:
O punish him! or to the Elysian shades
Dismiss my soul, where no *carnation* fades. *Pope.*

While the hues of youth,
Carnationed like a sleeping infant's cheek,
Rocked by the beating of her mother's heart,
Or the rose tints that summer twilight leaves
Upon the lofty glacier's virgin snow,
The blush of earth embracing with her heaven,
Tinge thy celestial aspect, and make tame
The beauties of the sun-bow which bends o'er thee.
Byron's Manfred.

CARNATION, in botany. See DIANTHUS.

CARNATION, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Corregio in Italy, and Rubens and Vandyke in Flanders, excelled in carnations. In coloring for flesh, there is so great a variety, that it is hard to lay down any general rules for instruction therein; neither are there any regarded by those who have acquired a skill this way. The various coloring for carnations may be easily produced, by taking more or less red, blue, yellow, or bistre, whether for the first coloring, or for the finishing: the color for women should be bluish; for children a little red, both fresh and gay; and for the men it should incline to yellow, especially if they are old.

CARNATION, SPANISH. See POINÇIANA.

CARNATION TREE. See CACALIA.

CARNEADES, a celebrated Greek philosopher, born at Cyrene in Africa, and founder of the third academy. He was an antagonist of the Stoics; and applied himself with great eagerness to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by the Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent Carneades, Diogenes, and Critolaus, to Rome, as ambassadors, who got it mitigated to 100 talents. Before they had an audience of the senate, they harangued to great multitudes, in different parts of the city. Carneades excelled in the vehement, and rapid Critolaus in the correct and elegant, and Diogenes in the simple and modest kind of eloquence. The former having one day harangued before Galba, and Cato the censor with great variety of thought, and copiousness of diction, in praise of justice, undertook the next day, with a view of establishing the doctrine of the uncertainty of human knowledge, to refute all his former arguments. Cato moved, that these ambassadors should be immediately sent back, as it was very difficult to discern the truth through the arguments of Carneades. He was afraid of that subtlety of wit, with which Carneades maintained either side of a question. His grand principle was, that there are only resemblances of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carneades argued in favor of injustice, yet he himself acted according to the strictest rules of justice. Carneades lived to be eighty-five years old; some say ninety: his death is placed in the fourth year of the 162d Olympiad.

CARNEDDE, in British antiquity, heaps of stones, supposed to be druidical remains, and thrown together at confirming a covenant. Gen. xxxi. 46. They are very common in the isle of Anglesey.

CARNEIA, in antiquity, a festival in honor of Apollo, surnamed Carneus, held in most cities of Greece, but especially at Sparta, where it was first instituted. The reason of the name, as well as the occasion of the institution, is controverted. It lasted nine days, beginning on the thirteenth day of the month Carneus. The ceremonies were an imitation of the method of living and discipline used in camps.

CARNEL; the building of ships, first with their timber and beams, and after bringing on their planks, is called carnel work, to distinguish it from clinch work. Vessels also, which go with mizen sails instead of main sails, are by some called carnels.

CARNELIAN, or CORNELION, in natural history, a sub-species of calcedony, of which there are three kinds, distinguished by three colors, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, like our common pebbles, and is generally met with between one inch and two or three inches in diameter: it is of a fine, compact, and close texture; of a glossy surface; and of all the degrees of red, from the palest flesh color to the deepest blood red. It has a conchoidal fracture, and a specific gravity of 2·6. It is semitransparent, and has a glistening lustre. It consists of 94 silica, 3·5 alumina, and 0·75 oxide of iron. It is generally free from spots, clouds, or variegations; but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one color, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. For this purpose it is excellently adapted, being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax. It is not at all affected by acid menstruums: the fire divests it of a part of its color, and leaves it of a pale red; but a strong and long continued heat will reduce it to a pale dirty gray. The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some good ones in Britain.

CARNESVILLE. See FRANKFORT.

CARNEW, a parish and town of Ireland; the parish is partly in the county of Wicklow, and partly in Wexford, and in 1821 contained a population of 5328. The town is in the county of Wicklow forty-four miles S.S.W. of Dublin, and sixteen north of Enniscorthy, and in 1821 contained 855 inhabitants; it has some manufactures of coarse woollens. It is distinguished for the defeat of the king's troops by the insurgents in 1798.

CARNHAWL, a town of Hindostan, in the province of Delhi. Here, in 1739, Kouli Khan gained a victory over the army of the great mogul; and in 1761 the Seiks, under Abdalla, defeated the Mahrattas. It is seated at the junction of the Hissar canal with the Jumna. It is eighty miles north-west of Delhi.

CARNIFEX, among the Romans, the common executioner. By reason of the odiousness of his office, he was expressly prohibited from having his dwelling house within the city. In middle age writers, carnifex denotes a butcher. Under the Anglo-Danish kings, the carnifex was an officer of great dignity; being ranked with the archbishop of York, earl Goodwin, and the lord steward. Flor. Wigorn. Anno. 1040. The public executioner was also an office of dignity under the kings of Israel.

CA'RNIFY, *v.*
CARNIFICA'TION, *n.*
CARNI'VOROUS, *adj.*
CARNO'SITY, *n.*
CA'RNOUS, *adj.*
CA'RNEOUS, *adj.*

All from Lat. *caro, carnis.* To carnify is to generate flesh; to convert nutriment into flesh; carnificating is the action of so generating or converting. Carnivorous is flesh-eating; carnosity is a fleshy excrescence; and carnous and carneous are fleshy.

At the same time, I think, I deliberate, I purpose, I command; in inferior faculties, I walk, I see, I hear, I digest, I sanguify, I *carnify*.
Hale. Origin of Mankind.

The first or outward part is a thick and *carnous* covering, like that of a walnut; the second, a dry and flosculous coat, commonly called mace.
Browne's Vulgar Errours.

In a calf, the umbilical vessels terminate in certain bodies, divided into a multitude of *carneous* papillæ.
Ray.

The muscle whereby he is enabled to draw himself together, the anatomists describe to be a distinct *carnous* muscle, extended to the ear. *Id.*

In birds there is no mastication or comminution of the meat in the mouth; but, in such as are not *carnivorous*, it is immediately swallowed into the crop or craw. *Id.*

By this method, and by this course of diet, with sudorificks, the ulcers are healed, and that *carnosity* resolved. *Wiseman.*

Man is by his frame, as well as by his appetite, a *carnivorous* animal. *Arbuthnot.*

But man is a *carnivorous* production,
And must have meals, at least one meal a day;
He cannot live like woodcocks upon suction,
But, like the shark and tiger, must have prey.
Byron's Don Juan.

CARNIOLA, a ducny of Germany, anciently Carnia, from the Carni, a tribe of Scythians, is bounded on the south by the Adriatic Sea, and part of Istria; on the north by Carinthia and Stiria; on the east by Sclavonia and Croatia; on the west by Friuli, the county of Gorz or Goritz, and a part of the Gulf of Venice; extending in length about 110 miles, and in breadth about fifty. It is very mountainous: some of its hilly parts being cultivated and inhabited, others covered with wood, and others buried in perpetual snow. The valleys are remarkably fruitful. Here are also mines of iron, lead, and copper; but salt is an imperial monopoly. It contains many medicinal springs and inland lakes. The common people are very hardy, going barefooted in winter through the snow, with open breasts, and sleeping on a hard bench, without bed or bolster. Their food is also very coarse and mean. In winter, when the snow

Byron's Don Juan.

CARNIOLA, a duchy of Germany, anciently Carnia, from the Carni, a tribe of Scythians, is bounded on the south by the Adriatic Sea, and part of Istria; on the north by Carinthia and Stiria; on the east by Sclavonia and Croatia; on the west by Friuli, the county of Goritz, and a part of the Gulf of Venice; extending in length about 110 miles, and in breadth about fifty. It is very mountainous: some of its hilly parts being cultivated and inhabited, others covered with wood, and others buried in perpetual snow. The valleys are remarkably fruitful. Here are also mines of iron, lead, and copper; but salt is an imperial monopoly. It contains many medicinal springs and inland lakes. The common people are very hardy, going barefooted in winter through the snow, with open breasts, and sleeping on a hard bench, without bed or bolster. Their food is also very coarse and mean. In winter, when the snow lies deep on the ground, the mountaineers bind either small baskets, or long thin narrow boards, like the Laplanders, to their feet, on which, with the help of a stout staff, they descend with great velocity from the mountains. When the snow is frozen, they make use of a sort of skaits. In different parts the inhabitants differ greatly in their dress, language, and manner of living. In Upper and Lower Carniola they wear long beards. The languages chiefly in use are the Sclavonian and German. The duchy is divided into the Upper, Lower, Middle, and Inner, Carniola. The principal commodities exported are iron, steel, lead, quicksilver, white and red wine, oil of olives, cattle, sheep, cheese, linen, and a kind of woollen stuff called mahalan, Spanish leather, honey, walnuts, and timber; together with all manner of wood work, as boxes, dishes, &c. Christianity was first planted here in the eighth century. Lutheranism made a considerable progress in it; but, excepting the Wallachians or Uskokes, who are of the Greek church, and style themselves staraverzi, i. e. old believers, all the inhabitants are Roman Catholics. Carniola was long a marquisate, but in 1231 was erected into a duchy. As its proportion towards the maintenance of the army, it pays annually 363,171 florins; but only two regiments of foot are quartered in it. Laybach, 170 miles S. S. W. of Vienna, and twenty-eight north-east of Trieste, is the capital of the duchy. The other principal towns are Ratmansdorf, Kramburg, Stein, and Ydria, in the North or Upper Carniola; Weichselburg, Gurikfeld, Landstratz, and Rudolfweith, in the south-east, or Lower; Trieste in the south-west, or Inner; and Laas, Gottlchee, Tscherment, and Mouling in the Middle district. For commercial purposes it has the advantage of the port of Fiume, in Austrian Istria, as well as Trieste.

CA'RNIVAL, *n.* Fr. *carnaval*; Ital. *carnevale.* A popish feast before Lent; a time of luxury See the next article.

The whole year is but one mad *carnival*, and we are voluptuous not so much upon desire and appetite, as by way of exploit and bravery.
Decay of Piety.

O great man-eater!
Whose every day is *carnival*, not sated yet?
Unheard of epicure! without a fellow!
Blair's Grave.

CARNIVAL, or CARNAVAL, was formerly observed with great solemnity by the Italians, particularly at Rome and Venice, from the twelfth day till Lent. Mr. Du Cange derives the word from Carn a-val, by reason the flesh then goes to pot, to make amends for the season of abstinence next ensuing. Accordingly in the corrupt Latin, he observes, it was called carnelevamen, and carnisprivium; as the Spaniards still denominate it carnes tollendas. Feasts, balls, operas, concerts of music, marriages, intrigues, &c. are chiefly held in carnival times. It begins at Venice the second holiday in Christmas. Lady Morgan gives the following lively picture of the carnival at Rome in 1820:—

'To the ceremonies and festivities of Christmas succeeds the carnival: that season of enjoyment over which concience holds no jurisdiction, and care no sway.

'On the first day of the Corso few of the regular forces are assembled; but all Rome is already a masquerade rehearsal. Old women are patching harlequin's jackets before their doors. Young ones assume the innocent waxen-faced mask, white trowsers, and shirt hanging loosely over every thing, with its sleeves tied with colored ribbons—the common disguise of all those who can afford no other. Already they try the point of their yet unexercised wit, and 'intriguent' and 'danno guai,' (i. e. tease and torment) all who pass on foot or in carriages; but more especially the forestieri, who are usually taken for English. Children are every where busy making or tying on their paper masks, and girding their wooden swords. At the sound of the cannon, which fired from the Piazza di Venezia, each day announce the commencement of the amusements, shops are closed, palaces deserted, and the Corso's long and narrow defile teems with nearly the whole of the Roman population. The scene then exhibited is truly singular; and for the first day or two infinitely amusing. The whole length of the street, from the Porta del Popolo to the foot of the Capitol, a distance of considerably more than a mile, is patrolled by troops of cavalry, the windows and balconies are crowded from the first to the sixth story by spectators and actors, who from time to time descend, and take their place and parts in the procession of carriages, or among the maskers on foot. Here and there the monk's crown and cardinal's red skull-cap are seen peeping among heads not more fantastic than their own. The chairs and scaffolding along the sides of the street are filled to crushing with maskers, and countryfolk in their gala dresses (by far the most grotesque that the Carnival produces). The centre of the Corso is occupied by the carriages of princes, potentates, the ambassadors of all nations, and the municipality of Rome; and two lines of carriages, moving in opposite directions on each side, are filled by English peers, Irish commoners, Polish counts, Spanish grandees, German barons, Scotch lairds, and French marquises; but above all, by the hired jobs of the badauds and pizzicaroli of Rome. These form not the least curious and interesting part of the procession, and best represent the Carnival, as it existed a century back. In an open carriage sits, bolt upright, la signora padrona, or mistress of the family, nearly the whole of her beautiful bust exposed, or only covered by rows of coral, pearl, or false gems: her white satin robe and gaudy head-dress left to 'the pitiless pelting of the storm,' showered indiscriminately from all the houses and by the pedestrians on the occupants of carriages, in the form of sugar-plums, but in substance of plaster of paris or lime. Opposite to her, sits her caro sposo, the model of all those cari sposi, of whom Jerry Sneak is the abstract and type. He, good man is dressed as a grand sultan or Muscovite czar his hands meekly folded, his eyes blinded with lime, and his face unmasked, to show that it is to him belongs the gay set-out, the handsome wife, the golden turban, and crimson caftan. The cavalier pagante, if there is one in the family, or the favorite Abate, if there is not, occupies the place next the lady, snugly hidden under the popular dress of Pierrot or Pagliaccio; while all the little signorini of the family, male and female, habited as harlequins, columbines, and kings and queens, are stuffed in without mercy. Even the coachman is supplied with a dress, and straddles over the box as an elderly lady, or an Arcadian shepherdess; and the footman (or the shop 'prentice, or the scrocone, who assumes his place behind the carriage) takes the guise of an English miss, or a French court lady; and figures in a spencer and short petticoat, with an occasional 'god-dam;' or, accoutred with an hoop and a fan, salutes the passers-by with 'Buon giour, Messieurs.'

'The carriages of a few of the princes, of the governor of Rome, and of Monsieur Blacas, the French ambassador, were conspicuous for their gaudy splendor; while the morris-dancers of Europe, the most thinking people of England, always foremost in the career of amusement, made more noise, occasioned more bustle, and threw more lime, than all the rest of the population put together.

'At the Ave Maria, or fall of day, the cannon again fire as a signal to clear the street for the horse-course. All noise then ceases; the carriages file off by the nearest avenue, their owners scramble to their windows, balconies, chairs, or scaffolds; while the pedestrians, that have no such resources, driven by the soldiery from the open street, are crowded on the footways to suffocation. But no terror, no discipline, can restrain their ardor to see the first starting of the horses; and lives, constantly risked, are frequently lost in this childish eagerness for a childish amusement.

'A temporary barrier, erected near the Porta del Popolo, is the point from which the race commences: another on the Piazza di Venezia is the termination of the course. The horses are small, and of little value. They have no rider, but are placed each in a stall behind a rope, which is dropped as soon as the moment for starting arrives; when the animals seldom require to be put in motion by force. A number of tin foil and paper flags are stuck over their haunches, small pointed bodies are placed to operate as a spur; and the noise and the pain of these decorations serve to put the horse on his full speed, to which it is further urged by the shouting of the populace. At the sound of the trumpet (the signal for starting), even at the approach of the officer who gives the order, the animals exhibit their impatience to be off; and they continue their race, or rather their flight, amidst the screams, plaudits, and vivats of the people of all ranks. This scene forms the last act of each day's spectacle; when every one is obliged to quit his Carnival habit; for it is only on one or two particular evenings that there is a masked ball at the Alberti Palace.'

Carnosity is used by some authors for a little tubercle or wen, formed in the urethra, the neck of the bladder, or yard, which stops the passage of the urine. Carnosities are very difficult of cure: they are not easily known but by introducing a probe into the passage, which there meets with resistance. They usually arise from some ill managed venereal malady.

CARNOT (L. N.), a distinguished revolutionist of France, was born in Burgundy, and entered the corps of engineers while very young. At the beginning of the revolution he was a knight of the order of St. Louis, and a deputy to the national convention. He became a member of the committee of public safety, in the days of Robespierre, Barrere, Couthon, and St. Just, and had the chief direction of military affairs. When, on the fall of Robespierre, the convention arrested the other members of the committee, he insisted on sharing their fate. From 1795 to 1797 he was one of the five members of the directory, but being charged in the latter year with a royalist conspiracy, though he was through life, perhaps, the steadiest of modern republicans, he was sentenced to banishment from France, and Buonaparte, on becoming first consul, recalled him, and made him minister of the war department. He voted against the establishment of the imperial government, but this piece of political honesty his master never resented, and afterwards appointed him chief inspector of reviews. On his retiring, he received a pension of 20,000 francs. After the campaign in Russia, he wrote a noble letter to the now falling emperor of France, offering his services to his country, and was made governor of Antwerp. During the Hundred Days Carnot was the minister of the interior, and displayed his previous probity and honor. In June 1815 he was a leading member of the provisional government, and heartily, but vainly, endeavoured to prevent the re-establishment of monarchy in France, from which he finally retired at that period, and died in 1823, in exile. Buonaparte, it is said, spoke slightingly of his military opinions; but he was certainly a superior military mathematician. His works are, Reflexions sur la Metaphysique du Calcul Infinitesimal, 1797, 8vo. De la Correlation des Figures de Geometrie, 1801, 8vo; La Geometrie de Position, 1803, 4to; Memoire sur la Relation qui existe entre les Distances respectives de cinq Points quelconques pris dans l' Espace, suivi d'un Essai sur les Transversales, 1806, 4to. He also wrote On the Defence of Fortified Places.

CARO (Annibal), a celebrated Italian poet, born at Civita Nuova in 1507. He was secretary to the duke of Parma: afterwards to cardinal Farnese; and was also a knight of Malta. He translated Virgil's Æneid into Italian, and was said by some to have equalled the original. He also translated Aristotle's Rhetoric, two Orations of Gregory Nazianzen, and a discourse of Cyprian. He wrote a comedy; and a miscellany of his poems was printed at Venice in 1584. He died in Rome in 1566.

CA'ROB, *s.* Ar. *karob*, *garoba*; Syr. *charouba*; Mod. Gr. *καρaβολος*, Span. *carobo*; Ital. *carruba*; Fr. *carroube*. A tree bearing large pods, called St. John's breed, or locust. See Ceratomia.

CAROCHA, a name which the Spaniards and Portuguese give to a mitre made of pasteboard, on which are painted flames and figures of demons, worn by those who are condemned to death by the infernal tribunal of the inquisition.

CARO'CHE, *s.* } Fr. *carosse*; Ital. *carrozza*;
CARO'CHED, *adj.* } Lat. *caruca*; καρυχιον.
A coach; a pleasure carriage. Minsheu says, a great coach. The word is frequent in our old writers, but is now obsolete. Mr. Todd thinks, that the modern unauthorised term barouch, may have been introduced by some learned charioteer, with a retrospective view to caroche.'

CAROENON, in antiquity, καροινον, or Carenum, names given by the Greeks and Romans to wine boiled over a slow fire, till only a half, third, or fourth part remained, and then mixed with honey or spices. Wine thus improved acquired several other names, such as mustum, mulsum, sapa, defrutum, &c. At this time the same operation is performed with respect to sack, Spanish, Hungarian, and Italian wines. In Italy, new wine which has been thus boiled, is put into flasks, and used for sallad and sauces. In Naples it is called musto collo, but in Florence it still retains the name of sapa. Plin. l. xxii. c. 2. Columella, de re rustica, l. xii. c. 20.

CA'ROL, *v.* & *n.* } Fr. *carolle*; Ital. *carola*;
CA'ROLING, *n.* } Lat. *choraula*. There is no lack of imputed parents for this word. Somner thinks it probable, though it is not easy to see the probability, that the words κυριε ἐλέησον, may have been corrupted into *kyrielle*, whence carol. Menage, somewhat more feasibly, gives *choreola*, a diminutive of *chorea*. Skinner supposes it to be derived 'à Fr. Gall. *carolle*; genus saltûs modulati; item canticum quoddam festivum, præsertim festo natalis usitatum: forte à Gr. χαρα, *gaudium*, χαιρω, *gaudeo*.' Cleland fetches it from the Celtic, *car*, or *cir*, a circle; because it is a song sung in a round; while Minsheu derives it 'of singing, rola, rola, that is bearing the burden of the song, as they tearme it;' and Mr. Brande partly agrees with him, as he deduces it from *cantare* and *rola*. Carolle, say Sherwood, is 'a kind of daunce wherein many daunce together.' None of them, however, have noticed that the Welsh *carawl*, a love song, a carol, though not bearing quite as close a resemblance in the pronunciation as as it does to the eye, may possibly be the original. To carol is to sing; to warble; to sing joyously; to sing in praise of. A carol, in a restricted sense, is a devotional or joyous song; generally, any song.

And let the graces dance unto the rest,
For they can do it best;
The whiles the maidens do their *carols* sing,
To which the woods shall answer, and their echo
ring. *Spenser.*

The fields did laugh, the flowres did freshly spring,
The trees did bud, and early blossomes bore,
And all the quire of birds did sweetly sing,
And told the gardin's pleasures in their *caroling*. *Id.*

And hear such heavenly notes and *carolings*
Of God's high praise, that fills the broken sky. *Id.*

No night is now with hymn or *carol* blest. *Shakspeare.*

The *carol* they began that hour,
How that life was but a flower. *Id.*

Even in the Old Testament, if you listen to David's harp, you shall hear as many hearse-like airs as *carols*. *Bacon.*

They gladly thither haste; and, by a choir
Of squadroned angels, hear his *carol* sung. *Milton.*

She with precious violed liquors heals,
For which the shepherds at their festivals
Carol her goodness loud in rustic lays. *Id.*

Opposed to her, on t'other side advance,
The costly feast, the *carol* and the dance,
Minstrels and music, poetry and play,
And balls by night, and tournaments by day. *Dryden.*

This done, she sung, and *carolled* out so clear,
That men and angels might rejoice to hear. *Id.*

Come, let's in some *carol* new
Pay to love and them their due. *Marvell.*

Young Colin Clout, a lad of peerless meed,
Full well could dance, and deftly tune the reed,
In every wood his *carols* sweet were known,
At every wake his nimble feats were shown. *Gay.*

Deep mourns the turtle in sequestered bower,
And shrill lark *carols* clear from her aerial tower. *Beattie.*

Her influence oft the festive hamlet proves,
Where the high *carol* cheers the' exulting ring;
And oft she roams the maze of wildering groves,
Listening the' unnumbered melodies of spring. *Id.*

Methought she *carolled* blithely in her youth,
As the couched nestling trills his vesper lay;
But song and smile, beauty and melody,
And youth and happiness, are gone from her. *Maturin.*

CAROLATH, a town and principality of Silesia, in the circle of Glogau, on the Oder, three miles N.N.W. of Beuthen.

CAROLINA, an extensive country of North America, originally comprehending the west part of Florida, and lying between 29° and 36° 30′ lat. N. It was bounded on the east by the Atlantic, on the west by the river Mississippi, on the north by Virginia, and on the south of Georgia by the Floridas. It is seated between the extremities of heat and cold, though the heat is more troublesome in summer than the cold in winter, the winters being very short, and the frosty mornings frequently succeeded by warm days. The air is generally serene and clear the greatest part of the year, but has heavy rains both in winter and at midsummer. Westerly winds bring very pleasant weather. The depth of winter is towards the end of February, but even then the ice is not strong enough to bear a man. In August and September there are sometimes winds, which are so violent as to make lanes of 100 feet wide, through the woods, tearing up the trees by the roots. They commonly happen about the time of the hurricanes which rage so fatally among the islands between the tropics. The soil on the coast is sandy; but farther up the country is so fruitful that they are at little trouble to manure their land. The grain most cultivated is Indian corn and rice, but any sort will thrive. There are also pulse of several sorts little known in England. All kinds of garden vegetables may be had in great plenty. Cotton has been planted here of late with great success: but the pitch pine tree forms the staple commodity of the country, affording pitch, tar, and turpentine, besides its value as timber. Fine white and red oak is also abundant, and cypress and bay trees crowd the swamps. The long spongy moss of these parts is said, in a remarkable way, to absorb the deleterious vapors, and contribute to the health of the inhabitants. In the back country the misletoe is found. An inferior kind of indigo, and various gums and medicinal drugs are also cultivated. Firs are bought of the Indians with vermillion, gunpowder, coarse cloth, iron, &c. and form a considerable article in trade. Carolina is adorned with many beautiful rivers, among which the Tennessee is the most conspicuous; and woods, which afford delightful seats for the planters, and render the enclosure of their lands very easy. As they have plenty of fish, wild fowl and venison, besides other necessaries, produced naturally, they live easy and luxuriously; and are not very refined in their manners. The chief mountains are the Apalachian, which see.

Carolina was discovered by Sebastian Cabot, about A. D. 1500; but the settling being neglected by the English, a colony of French Protestants were transported thither, and named the place of their settlement Carolina, in honor of Charles IX. of France; but in a short time the colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till 1664, when 800 English landed at Cape Fear, and took possession of the country. In 1670, Charles II. of Britain granted Carolina to lords Berkeley, Clarendon, Craven and Ashley, Sir George Carteret, Sir William Berkley, and Sir John Colliton. The plan of government for this new colony was drawn up by the celebrated Mr. Locke, who proposed a universal toleration in religious matters, the only restriction being, that every person claiming the protection of the settlement, should, at the age of seventeen, register himself in some communion. The code of Carolina gave the eight proprietors, and their heirs, not only all the rights of a monarch, but all the powers of legislation. This sovereign body, called the Palatine Court, was invested with the right of nominating to all employments and dignities, and even of conferring nobility, but with new and unprecedented titles. They were, for instance, to create in each county two caciques, each of whom was to be possessed of 24,000 acres of land; and a landgrave, who was to have 80,000. The persons on whom these honors should be bestowed, were to compose the upper house, and their possessions were made unalienable. They had only the right of letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about one shilling per acre, and even this rent was redeemable. All the inhabitants, both slaves and freemen, were under an obligation to take up arms upon the first order from the palatine court. The defects of this constitution soon became apparent. The proprietary lords endeavoured to establish an arbitrary government; and the colonists exerted themselves with great zeal to avoid servitude In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its peculiar advantages of situation. In 1705 Carteret, afterwards lord Granville, who, as oldest proprietor, was sole governor, formed a design of obliging all the non-conformists to declare themselves of the Church of England. This act of violence, though disavowed by the mother country, inflamed the minds of the people. In 1720 the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword; but in 1728 the lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were all deprived of their prerogative, except lord Granville. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The settlement of Georgia commenced in 1752, and the division took place between North and South Carolina, about three years earlier.

Carolina, North, one of the United States of America, situated between 1° 1′ and 6° 35′ W. long. of Washington, and between 33° 51′ and 36° 30′ N. lat. It is 450 miles long from east to west, and 180 broad from north to south, being bounded on the north by Virginia, on the east and south-east by the Atlantic, on the south by South Carolina, and on the west by the new state of Tennessee. This last was originally a part of North Carolina, but was given up to the United States in 1789, and since erected into a separate state. See Tennessee. North Carolina is divided into eight districts, viz. Edenton, Newbern, and Wilmington, which extend along the coast; and Halifax, Hillsborough, Salisbury, Morgan, and Fayetteville, the greater part of which extend across the state from north to south. These districts are subdivided into sixty-two counties, which will be described in their order; their aggregate superficies amounting, according to American computation, to 43,800 square miles. The chief rivers are the Chowan, Roanoke, Pamlico, Yadkin, Catawba, Neuse, Cape Fear, Pasquotank, &c. The chief sounds are Albemarle, Pamlico, and Core. Although North Carolina has upwards of 200 miles of sea-coast, besides being indented by three very large inlets called sounds, it does not afford one good harbour; indeed, a ledge of sand banks flank the coast in its whole extent, rendering the navigation very dangerous in stormy weather, and almost inaccessible at all times; it consequently partakes more of the character of an interior than a maritime state. Some little external intercourse, however, is maintained through Wilmington, situated on Cape Fear River, which intersects the centre of the state from north to south, falling into the sea in the lat. of 34° N. and the productions of the western part of the state are facilitated in their conveyance to market by the Yadkin and Catawba Rivers, which intersect that part between the long. of 3° and 4° W. running south into South Carolina. The Neuse, Tar, Roanoke, and Cho-themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissension, became incapable of making any progress, though great things had been expected from its peculiar advantages of situation. In 1705 Carteret, afterwards lord Granville, who, as oldest proprietor, was sole governor, formed a design of obliging all the non-conformists to declare themselves of the Church of England. This act of violence, though disavowed by the mother country, inflamed the minds of the people. In [illegible] the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword; but in 1728 the lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were all deprived of their prerogative, except lord Granville. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The settlement of Georgia commenced in 1732, and the division took place between North and South Carolina, about three years earlier.

Carolina, North, one of the United States of America, situated between 1° 1′ and [illegible] W. long. of Washington, and between [illegible] and 36° 30′ N. lat. It is 450 miles long from east to west, and 180 broad from north to south, being bounded on the north by Virginia, on the east and south-east by the Atlantic, on the south by South Carolina, and on the west by the new state of Tennessee. This last was originally a part of North Carolina, but was given up to the United States in 1789, and since erected into a separate state. See Tennessee. North Carolina is divided into eight districts, viz. Edenton, Newbern, and Wilmington, which extend along the coast; and Halifax, Hillsborough, Salisbury, Morgan, and Fayetteville, the greater part of which extend across the state from north to south. These districts are subdivided into sixty-two counties, which will be described in their order; their aggregate superficies amounting, according to American computation, to 43,800 square miles. The chief rivers are the Chowan, Roanoke, Pamlico, Yadkin, Catawba, Neuse, Cape Fear, Pasquotank, &c. The chief sounds are Albemarle, Pamlico, and Core. Although North Carolina has upwards of 200 miles of sea-coast, besides being indented by three very large inlets called sounds, it does not afford one good harbour, indeed, a ledge of sand banks flank the coast in its whole extent, rendering the navigation very dangerous in stormy weather, and almost inaccessible at all times; it consequently partakes more of the character of an interior than a maritime state. Some little external intercourse, however, is maintained through Wilmington, situated on Cape Fear River, which intersects the centre of the state from north to south, falling into the sea in he lat. of 34° N. and the productions of the western part of the state are facilitated in their onveyance to market by the Yadkin and Catawba Rivers, which intersect that part between the ong. of 3° and 4° W. running south into South Carolina. The Neuse, Tar, Roanoke, and Chowan, are other rivers which intersect the north-east part of the state falling into the great inlets of Pamlico and Albermarle Sounds, which it is proposed to connect with Chesapeake Bay, by means of the Pasquotank, and a canal through the Dismal Swamp. The coast for about seventy miles from the shore is level and swampy, but westward the ground gradually rises into a mountainous country, being in parts beautifully diversified. Ground peas run along the surface of the earth, and are covered by hand with a light mould. The pods run under ground. They taste like nuts and are eaten raw or roasted. The country suits the breeding of sheep, but their wool is neither good nor plentiful on the low lands. Black cattle are easily raised, requiring little provision in winter, and in summer nothing but a little salt occasionally. Pork is also raised with little trouble. The hogs are allowed to roam at large in the woods, and grow fat on acorns and roots. The climate is said to be peculiarly favorable to the vine. A species of rock, supposed to be a concretion of marine shells, supplies the want of lime-stone, and the state abounds with iron ore. The annual exports amounted on the 30th Sept. 1791, to 524,548 dollars, and in 1823 to only 482,417, the shipping belonging to the state in 1821 was 38,864 tons. In 1820 the population was 638,829, of whom 14,612 were free blacks, and 205,017 were slaves. The north Carolinians are mostly planters, and have little intercourse with strangers, but have a natural fondness for society which renders them hospitable to travellers. In the maritime districts, the prevailing religious sects are the Episcopalians and Methodists; but in the western, the Presbyterians and Moravians are most numerous. Quakers and Baptists are also interspersed through the state. All persons in public offices, and all who deny the being of a God, are excluded from sitting in either house of assembly. Newbern is the largest town of North Carolina, and was formerly the residence of the governor. Each of the other six above mentioned, however, had their turns at the seat of the general assembly, till lately that Releigh, situate near the centre of the state, has been established as the metropolis. In 1789 the general assembly passed a law incorporating forty gentlemen, five from each district, as trustees of the University of North Carolina; to whom in December 1791, they granted a loan of £5000 to enable them to proceed with their buildings. There is a very good academy at Warenton, another at Williamsborough, in Granville, and several others of considerable note, in different towns in the state. In the south-west part of the state is a very singular mountain.

Carolina, South, another of the United States of North America, being divided from North Carolina by a conventional line, and by the Atlantic coast, in a S.S.W. direction; from the lat. of 33° 50′ to the Savannah River, in the lat. of 32° 2′ N.; and by the Savannah River, in a N.N.W. direction, until it cuts the south-west point of North Carolina, which separates it from the state of Georgia, its area being 30,800 square miles. The general features, character of the soil, and productions of this state are very similar to North Carolina, but having the advantage of several fine navigable rivers and some tolerably good harbours, to facilitate an external commerce, whilst North Carolina ranks among the least, South Carolina ranks among the most important states of the Union. The Yadkin River, rising in the north-east, which when it enters this state is called the Great Pedee, and, after being joined by several tributary streams, falls into George-town Bay; and the Catawba, which also rises in the north-east, and in this state is first called the Wateree, and afterwards the Santee, is united by a canal to Cooper River, which falls into Charleston harbour. Numerous streams, intersecting all the north-west part, unite with the Santee about the centre of the state; and between the Santee and the Savannah are the Edisto, Bigslake, and Coosawhatchie Rivers; so that there is hardly five miles in the state without the advantage of water communications: between the mouths of the Santee and Savannah rivers, the coast is flanked by a chain of islands, on which is produced the valuable cotton called Sea Island. The swamps produce vast quantities of the finest rice, the seed of which was first introduced from Madagascar at the close of the seventeenth century, and previous to 1790 indigo was cultivated to a great extent, and with proportionate advantage; but, since that period, the culture of the cotton plant in the upland country has superseded every other pursuit, and has been carried to an extent without any precedent. The value exported, including rice, in 1823 amounted to 6,898,814 dollars; whilst the value of the merchandise imported direct did not exceed 2,419,100 dollars, the balance being equalised through New York, Philadelphia, and Baltimore. South Carolina is divided into thirty districts, and the population, which in 1790 was only 240,073, in 1820 was 502,741, of whom 6806 were free blacks, and 258,475 slaves. Columbia, nearly in the centre of the state, 506 miles south-west by south of Washington, is the seat of its legislative assembly.

Charleston, which was formerly the capital of all Carolina before the division, is still reckoned the chief town; but Columbia is the seat of government. The public offices have, however, in some measure been divided for the accommodation of the inhabitants of the lower counties, and a branch of each retained in Charleston. There are several respectable academies in Charleston, one in Beaufort, on Port Royal Island, and several others in different parts of the state. Three colleges have lately been incorporated by law; one at Charleston, one at Winnsborough, in the district of Camden, and the other at Cambridge, in the district of Ninety-Six. The legislature, in their session in January 1795, appointed a committee to enquire into the practicability of, and to report a plan for the establishment of schools in different parts of the state. The Presbyterians are the most numerous religious sect.

CAROLINE, a county of the state of Maryland, bounded on the east by Kent county, state of Delaware, and on the west by the Tuckapo and Choptank Rivers, which fall into Chesapeake Bay. Also an interior county in the east part of Virginia, bounded on the north-east by dity of the country, affording pitch, tar, and turpentine, besides its value as timber. Fine white and red oak is also abundant, and cypress and bay trees crowd the swamps. The long spongy moss of these parts is said, in a remarkable way, to absorb the deleterious vapors, and contribute to the health of the inhabitants. In the back country the misletoe is found. An inferior kind of indigo, and various gums and medicinal drugs are also cultivated. Firs are bought of the Indians with vermillion, gunpowder, coarse cloth, iron, &c. and form a considerable article in trade. Carolina is adorned with many beautiful rivers, among which the Tennessee is the most conspicuous; and woods, which afford delightful seats for the planters, and render the enclosure of their lands very easy. As they have plenty of fish, wild fowl and venison, besides other necessaries, produced naturally, they live easy and luxuriously; and are not very refined in their manners. The chief mountains are the Apalachian, which see.

Carolina was discovered by Sebastian Cabot, about A. D. 1500; but the settling being neglected by the English, a colony of French Protestants were transported thither, and named the place of their settlement Carolina, in honor of Charles IX. of France; but in a short time the colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till 1664, when 800 English landed at Cape Fear, and took possession of the country. In 1670, Charles II. of Britain granted Carolina to lords Berkeley, Clarendon, Craven and Ashley, Sir George Carteret, Sir William Berkley, and Sir John Colliton. The plan of government for this new colony was drawn up by the celebrated Mr. Locke, who proposed a universal toleration in religious matters, the only restriction being, that every person claiming the protection of the settlement, should, at the age of seventeen, register himself in some communion. The code of Carolina gave the eight proprietors, and their heirs, not only all the rights of a monarch, but all the powers of legislation. This sovereign body, called the Palatine Court, was invested with the right of nominating to all employments and dignities, and even of conferring nobility, but with new and unprecedented titles. They were, for instance, to create in each county two caciques, each of whom was to be possessed of 24,000 acres of land; and a landgrave, who was to have 80,000. The persons on whom these honors should be bestowed, were to compose the upper house, and their possessions were made unalienable. They had only the right of letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about one shilling per acre, and even this rent was redeemable. All the inhabitants, both slaves and freemen
were under an obligation to take up arms
the first order from the palatine court.

themselves with great zeal to avoid servitude In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its peculiar advantages of situation. In 1705 Carteret, afterwards lord Granville, who, as oldest proprietor, was sole governor, formed a design of obliging all the non-conformists to declare themselves of the Church of England. This act of violence, though disavowed by the mother country, inflamed the minds of the people. In 1720 the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword; but in 1728 the lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were all deprived of their prerogative, except lord Granville. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The settlement of Georgia commenced in 1752, and the division took place between North and South Carolina, about three years earlier.

Carolina, North, one of the United States of America, situated between 1° 1′ and 6° 35′ W. long. of Washington, and between 33° 51′ and 36° 30′ N. lat. It is 450 miles long from east to west, and 180 broad from north to south, being bounded on the north by Virginia, on the east and south-east by the Atlantic, on the south by South Carolina, and on the west by the new state of Tennessee. This last was originally a part of North Carolina, but was given up to the United States in 1789, and since erected into a separate state. See Tennessee. North Carolina is divided into eight districts, viz. Edenton, Newbern, and Wilmington, which extend along the coast; and Halifax, Hillsborough, Salisbury, Morgan, and Fayetteville, the greater part of which extend across the state from north to south. These districts are subdivided into sixty-two counties, which will be described in their order; their aggregate superficies amounting, according to American computation, to 43,800 square miles. the Rappahannack River, and south-west by the North Anna River.

Caroline Amelia Elizabeth, late queen of England, and consort of his late majesty king George IV. was born on the 17th of May, 1768. Her father, Charles William Ferdinand, hereditary prince of Brunswick, succeeded to the dukedom in 1780, and died 10th November, 1806. See Brunswick. This princess, in common with her sisters, received her education almost entirely under the inspection of the duchess: she was from her youth of a gay and lively disposition, and particularly attentive to the English visiters at her father's court; whom she called, 'The good and brave English!'

Some months after the French revolution, she had a personal interview with her cousin the duke of York, and from that period the family alliance appears to have been in contemplation. Negociations for a marriage between his present majesty, then prince of Wales, and the princess Caroline of Brunswick, were accordingly entered into; and every arrangement having been completed, on the morning of the 20th of December, 1794, the princess, now become by contract princess of Wales, accompanied by her mother and a numerous retinue, departed from Brunswick for Vienna. Here, on their arrival, the duchess was indisposed; but having revived, they proceeded to the palace of Harrenhausen, near Hanover; where the royal party dined. On the 3d of Jannary 1795, they reached Osnaburg, where a messenger met them from lord St. Helens, to announce the return of commodore Payne's squadron to England, and the danger of entering Holland. The bishop's palace had been prepared for their reception; and after a residence of a few weeks stay at Hanover, they proceeded to Cuxhaven, and the princess embarked March 28th, on board his Majesty's ship Jupiter. She landed from this vessel at Greenwich in the afternoon of the 4th April. Magnificent preparations had been made for her reception: on the 8th of April, was celebrated her marriage with the Prince of Wales. But the union was never, personally, a happy one. Its principal importance to the nation arose, of course, from the expectation of a family in the direct line of the crown, and in the ensuing year was born the princess Charlotte, the joy, the pride of the country; and in her early death, the object of its liveliest grief.

We draw a vail over the circumstance known at the time, as the 'Delicate Investigation,' in which the princess of Wales was fully acquitted of all serious charges, by the most impartial judges. In August 1814 she went abroad, contrary to the advice of her confidential friends; if such she ever possessed. Her conduct in this memorable absence became publicly scrutinised on her return; and a bill of pains and penalties on the direct charge of adultery, was introduced into Parliament by his Majesty's ministers, and read a first and second time in the house of lords. The majority, however, in its favor was so small, and the whole measure evidently so repugnant to the feelings of the country that it was finally withdrawn.

In less than a fortnight after the coronation of the king, her majesty was taken dangerously ill, in consequence of having taken a very large dose of magnesia. On Thursday the 2d of August, she was attended by three physicians, Dr. Maton, Dr. Warren, and Dr. Holland, and copiously bled; she passed a quiet night, but her symptoms remained the same. The following day she was immersed for about a quarter of an hour in a warm bath, which moderated the pain, but in other respects was unavailing. Connected with inflammation of the bowels was a nausea at the stomach, which repelled both food and medicine. Another physician, Dr. Ainslie, was now called in; her majesty's legal advisers also attended for the management of her property and other legal matters. Towards the morning of Saturday she obtained some tranquil sleep; but her disorder, with some fluctuations, increased speedily, and on the 7th, during the king's absence in Ireland, she died at Brandenburgh House, Hammersmith. Her funeral was conducted by the government; and the populace evinced a singular attachment to her memory by compelling it, contrary to the public orders given, to pass through the city of London. The body was finally conveyed, agreeably to her own request, to the family vault of her ancestors at Brunswick.

Caroline Islands, a range of thirty islands in the North Pacific Ocean, discovered in 1686, by the Spaniards. They lie to the east of the Philippines, between 138° and 155° E. long. and 8° and 11° N. lat. The natives resemble those of the Philippines. The most considerable island is Hogoleu, about ninety miles long and forty broad: the next is Yap, at the west extremity of the chain, but not above a third part of the size of Hogoleu. They have been little visited by recent navigators.

CAROLINEA, in botany, a genus of the class monadelphia, order polyandria: cal. single, truncate; filaments branched; style very long: stig. six: caps. woody, one-celled, many-seeded. Species two; one a Guiana tree with very entire leaves; flowers solitary, very large and yellow; filaments red; antheræ purple. The other, denominated also bombax, a South American plant of less consequence.

CAROLOSTADIANS, or Carlostadians, an ancient sect of Lutherans, who denied the real presence of Christ in the Eucharist; thus denominated from their leader Carolostadius. They are the same with the Sacramentarians, and agree in most things with the Zuinglians.

CAROLOSTADIUS (Andrew), archdeacon of Wittenberg, was converted by Luther, and was the first of all the reformed clergy who took a wife; but afterwards disagreed with Luther, chiefly on the point of the sacrament.

CAROLUS, an ancient English gold coin, broad and thin, struck under Charles I. Its value has of late been at twenty-three shillings, though at the time it was coined it was rated at twenty.

CAROTIDS. See ANATOMY.

CARORA, a city of Colombia, in the province of Venzuela, situate about forty-five miles from the strait that separates the gulf from the lake of Maracaibo, and 150 miles west of Valencia. It is intersected by a stream called the

Morera, that runs east into the Caribbean Sea. The inhabitants, about 6000 in number, subsist principally by means of cattle and mules, which they drive to the coast for transhipment to the West India islands. The surrounding country produces a variety of odoriferous balsams and aromatics.

CA'ROTID, *adj.* } Lat. *carotides.* Two
CARO'TIDAL, *adj.* } arteries, from the aorta ascendens, which have their origin near the subclavian arteries.

The *carotid*, vertebral, and splenick arteries, are not only variously contorted, but also here and there dilated, to moderate the motion of the blood. *Ray.*

The two *carotidal* and the two vertebral arteries, are this golden quaternion. *Smith.*

CARO'USE, *v.* & *n.* } Fr. *carouse, carous-*
CARO'USER, *n.* } *ser;* Span. *caraos.* Dr.
CARO'USAL, *n.* } Johnson, after Menage and Skinner, derives the French from the German, *gar ausz*, all out, meaning 'empty it entirely.' The Spanish *caraos* signifies the act of drinking a person's health in a bumper. The origin of the word has also been sought in the Dutch *ruischen*, to roar; and in the Celtic *car*, a circle, because carousing is the custom of drinking round. To carouse is to quaff copious cups; to imbibe drink lavishly. A carouse denotes a drinking match; a hearty dose of liquor. Carousal, which was formerly accented on the first syllable, is a festival; and that too common character, a toper, is entitled to the more poetical appellation of a carouser.

Now, my sick fool, Roderigo,
Whom love hath almost turned the wrong side out,
To Desdemona hath to-night *caroused*
Potations pottle deep. *Shakspeare.*

He calls for wine, a health, quoth he, as if
H'ad been aboard *carousing* to his mates
After a storm. *Id.*

Please you, we may contrive this afternoon,
And quaff *carouses* to our mistress' health. *Id.*
Learn with how little life may be preserved,
In gold and myrrh they need not to *carouse.*
Raleigh.

Now hats fly off, and youths *carouse*,
Healths first go round, and then the house,
The brides came thick and thick. *Suckling.*

He had so many eyes watching over him, as he could not drink a full *carouse* of sack, but the state was advertised thereof within few hours after.
Davies on Ireland.

Our cheerful guests *carouse* the sparkling tears
Of the rich grape, whilst musick charms their ears.
Denham.

This game, these *carousals* Ascanius taught,
And building Alba to the Latins brought.
Dryden.

Waste in wild riot what your land allows,
There ply the early feast and late *carouse.*
Pope.

The bold *carouser*, and adventuring dame,
Nor fear the fever, nor refuse the flame;
Safe in his skill, from all constraint set free,
But conscious shame, remorse, and piety.
Granville.

Death leads the dance, or stamps the deadly die,
Nor ever fails the midnight bowl to crown,
Gaily *carousing* to his gay compeers,
Inly he laughs, to see them laugh at him
As absent far. *Young's Night Thoughts.*

CARP. Fr. *carpe;* Ital. *carpione.* A fresh-water fish, usually kept in ponds.

Nor drain I ponds, the golden *carp* to take,
Nor trowle for pikes, dispeoplers of the lake.
Gay's Rural Sports.

CA'RP, *v.* & *n.* } Fr. *charpir;* Ital. *car-*
CA'RPER, } *pire;* Lat. *carpo.* The
CA'RPING, *adj.* } French signifies to comb
CA'RPINGLY, *adv.* } wool, to hackle flax; the Italian expresses to snatch away, to wrest. In Welsh *carpiaw* means to tear, to tear away; and *carp* is that which is torn away. In all these words the analogy with the English may be traced. To carp is to censure; to cavil at; to find fault with; which may be considered as a sort of snatching at; wresting; pulling to pieces. Carping is equivalent to captious and censorious.

Tertullian, even often through discontentment, *carpeth* injuriously at them, as though they did it even when they were free from such meaning. *Hooker.*

His mouth a poisonous quiver, where he hides
Sharp venomed arrows, which his bitter tongue,
With squibs, *carps*, jests, unto their objects guides;
Nor fears he gods on earth, or Heaven to wrong.
Fletcher's Purple Island.

This your all-licensed fool
Doth hourly *carp* and quarrel, breaking forth
In rank and not to be endured riot. *Shakspeare.*
I have not these weeds,
By putting on the cunning of a *carper.* *Id.*

We derive out of the Latin at second hand by the French, and make good English, as in these adverbs, *carpingly*, currently, actively, colourably. *Camden.*

When I spoke,
My honest homely words were *carped* and censured,
For want of courtly style. *Dryden.*

No *carping* critick interrupts his praise,
No rival strives but for a second place.
Granville.

Lay aside therefore a *carping* spirit, and read even an adversary with an honest desire to find out out his true meaning; do not snatch at little lapses and appearances of mistake. *Watts.*

CARP, in ichthyology. See CYPRINUS, and ANGLING.

CARPÆA, *καρπαια*, a kind of dance anciently in use among the Athenians and Magnesians, performed by two persons, the one a laborer, the other acting as a robber. The laborer laying by his arms, went to ploughing and sowing, still looking warily about him as afraid of being surprised; the robber at length appeared, and the laborer quitting his plough, betook himself to his arms, and fought in defence of his oxen. The whole was performed to the sound of flutes, and in cadence. Sometimes the robber was overcome, and sometimes the laborer; the victor's reward being the oxen and plough. The design of the exercise was to teach and accustom the peasants to defend themselves against the attacks of ruffians.

CARPATHIAN MOUNTAINS, a grand chain which divides Hungary and Transylvania from Poland on the north and north-east, and from Moravia on the north-west, extending about 500 miles. See BASTARNICÆ ALPS.

CARPATHIAN SEA, or CARPATHIUM MARE, the sea that washes the coast of Carpathus.

CARPATHUS, or CARPATHOS, an island on the coast of Asia, 200 stadia or furlongs in compass, and 100 in length. Its name is said to be from its situation on the coast of Caria. It lies between Rhodes and Crete, in the Carpathian Sea, and is said to have been first inhabited by some Cretan soldiers of Minos. According to Strabo it had anciently four cities; according to Scylax only three, whilst Ptolemy mentions but one, which he calls Posepum. The island is now called Scarpanto.

CARPENDOLO, a town of Italy, seated on the Miese, in the Veronese, included in the Italian republic. A battle was fought at this place in January 1797, between the French and Austrians, wherein the republicans under general Menard were victorious, and took 900 prisoners.

CARPENTARIA, a large bay on the north coast of New Holland, discovered in 1618, by a Dutch captain, named Carpenter. That part of the country which borders on the east side of the bay is also called Carpentaria. It has about 1200 miles of coast, and some good harbours. It is frequented by Chinese junks to fish for the the Beche-le-mar, one of the most delicious of the finny tribe, which superabound at the entrance of this bay.

CA'RPENTER, *n.* } Fr. *charpentier*; Span.
CA'RPENTRY, *n.* } *carpintero*; low Lat. *carpentarius*. An artificer in wood, as far as relates to the largest and strongest part of the wood work in houses and ships. The finer work belongs to the joiner. The trade or art of a carpenter.

> This work performed with advisement good,
> Godfrey his *carpenters*, and men of skill
> In all the camp, sent to an aged wood.
>
> *Fairfax's Tasso.*

> In building Hiero's great ship, there were three hundred *carpenters* employed for a year together.
>
> *Wilkins.*

> In burdened vessels first with speedy care,
> His plenteous stores do seasoned timbers send;
> Whither the brawny *carpenters* repair,
> And, as the surgeons of maimed ships, attend.
>
> *Dryden.*

> It had been more proper for me to have introduced *carpentry* before joinery, because necessity did doubtless compel our forefathers to use the conveniency of the first, rather than the extravagancy of the last.
>
> *Moxon's Mechanical Exercises.*

CARPENTER, SHIP, an officer appointed to examine and keep in order the frame of a ship, together with her masts, yards, boats, and all other wooden machinery. It is his duty in particular to keep the ship tight; to review the decks and sides, and to caulk them when it is necessary. In the time of battle, he is to examine, with all possible attention, the lower apartments of the ship, to stop any holes that may have been made by shot, with wooden plugs provided of several sizes.

CARPENTRAS, a beautiful town of France, in Provence, standing on the left bank of the Anson, at the foot of Mont Ventoux. It was once the capital of the papal county of Venaissin, and the see of a bishop, but became
orated with France at the revolution, and
longs to the department of Vancluse. It
od public library, bequeathed originally to the town by one of its bishops; a Roman triumphal arch in tolerable preservation; and several remarkable Roman antiquities. Wine, brandy, and fruit, are its staple articles of trade. In the neighbourhood is a fine modern aqueduct of forty-eight arches. Population about 9000, including perhaps 2000 Jews. Distant twelve miles east of Orange, and thirty-eight north-west of Aix.

CARPENTRY. The art of carpentry, generally speaking, includes every method of working or employing timber in the construction of buildings; but, as it is evident that coarse rough work requires very different management from the delicate finish of interior arrangement, it is usually divided into two classes. Carpentry, properly so called, to which belongs flooring, roofing, and the working of all large pieces of wood; and Joinery, which includes the various ornamental works in wood, (except cabinet-making), besides doors, window sashes, and other objects intended for close inspection. The mode of constructing roofs has already been examined under the article ARCHITECTURE, which see. Joinery will also form a distinct subject in our arrangement; we commence, therefore, with the more elementary parts of the art.

The modes by which timbers are connected together are, generally speaking, perpendicularly, obliquely, sideways, and endways. When timbers are joined perpendicularly, the fibres and joints of one piece run perpendicularly to the fibres of the other; and the joint may then be termed a transverse or a perpendicular joint. When they are connected obliquely, the fibres of the one piece run in an oblique direction towards those of the other; and for this reason it is called oblique joining, and the joint is termed an oblique joint. Timbers are joined sideways when their joints are parallel to the fibres of each piece; and therefore it is termed lateral, or longitudinal, joining, and the joint is called a lateral or a longitudinal joint. When timbers are joined edgeways, their common seam or joint is perpendicular to the fibres of each piece, and the joint is then said to be a butting joint.

With respect to joining timbers perpendicularly, fig. 1. plate I. CARPENTRY, represents a section of a trimmer, and a part of the joist, framed with a simple mortise and tenon in a longitudinal direction. The tenon is usually made in the middle with a plain shoulder.

Fig. 3 represents a section of a girder through its mortises, and figs. 2 and 4 delineate part of the joist in a longitudinal direction. The best method, in order to give strength to the tenons, is to make a rest of a short length under it, with a sloping shoulder above, extending in a line from the extremity of the rest, to the perpendicular of the square shoulder below at the upper edge of the joist.

Fig. 4, plate I. of CARPENTRY, represents the section of a double floor, with a girder taken in a transverse direction to the bridging joists.

A shows the section of the girder; D E, D E, the binding joists; *a*, *a*, *a*, represent also the ends of bridging joists; *b*, *b*, *b*, the ends of ceiling joists, chased, mortised into binding joists, by a method which will be hereafter described

Fig. 5, of the same plate, shows the section of to the town by one of its bishops; a Roman triumphal arch in tolerable preservation; and several remarkable Roman antiquities. Wine, brandy, and fruit, are its staple articles of trade. In the neighbourhood is a fine modern aqueduct of forty-eight arches. Population about 9000, including perhaps 2000 Jews. Distant twelve miles east of Orange, and thirty-eight north-west of Aix.

CARPENTRY. The art of carpentry, generally speaking, includes every method of working or employing timber in the construction of buildings; but, as it is evident that coarse rough work requires very different management from the delicate finish of interior arrangement, it is usually divided into two classes. Carpentry, properly so called, to which belongs flooring, roofing, and the working of all large pieces of wood; and Joinery, which includes the various ornamental works in wood, (except cabinet-making), besides doors, window sashes, and other objects intended for close inspection. The mode of constructing roofs has already been examined under the article ARCHITECTURE, which see. Joinery will also form a distinct subject in our arrangement; we commence, therefore, with the more elementary parts of the art.

The modes by which timbers are connected together are, generally speaking, perpendicularly, obliquely, sideways, and endways. When timbers are joined perpendicularly, the fibres and joints of one piece run perpendicularly to the fibres of the other; and the joint may then be termed a transverse or a perpendicular joint. When they are connected obliquely, the fibres of the one piece run in an oblique direction towards those of the other; and for this reason it is called oblique joining, and the joint is termed an oblique joint. Timbers are joined sideways when their joints are parallel to the fibres of each piece; and therefore it is termed lateral, or longitudinal, joining, and the joint is called a lateral or a longitudinal joint. When timbers are joined edgeways, their common seam or joint is perpendicular to the fibres of each piece, and the joint is then said to be a butting joint.

With respect to joining timbers perpendicularly, fig. 1. plate I. CARPENTRY, represents a section of a trimmer, and a part of the joist, framed with a simple mortise and tenon in a longitudinal direction. The tenon is usually made in the middle with a plain shoulder.

Fig. 3 represents a section of a girder through its mortises, and figs. 2 and 4 delineate part of the joist in a longitudinal direction. The best method, in order to give strength to the tenons, is to make a rest of a short length under it, with a sloping shoulder above, extending in a line from the extremity of the rest, to the perpendicular of the square shoulder below at the upper edge of the joist.

Fig. 4, plate I. of CARPENTRY, represents the section of a double floor, with a girder taken in a transverse direction to the bridging joists. A shows the section of the girder; DE, DE, the binding joists; *a*, *a*, *a*, represent also the ends of bridging joists; *b*, *b*, *b*, the ends of ceiling joists, chased, mortised into binding joists, thod which will be hereafter described the same plate, shows the section of

of the pieces, which is cut out to receive
rt remaining in the other, after its socket
cut out. By this mode of joining tim-
the pieces may be so notched as to have
surfaces in the same plane, or one above the
r, as may be found convenient.

These methods are used to connect bond
bers at the corners of a building. Fig. 11
presents an excellent mode of fitting beams
wall plates, when the walls are affected by
ateral pressure. A small notch is cut out of
the beam, and the contrary parts, forming a
double notch, are cut in the wall plate to receive
it. Fig. 11 represents a longitudinal part of the
beam upon a transverse section of the wall plate;
and fig 12 shows the upper part of the wall
plate, wherein the two notches are made; fig.
13, lower side of the beam, exhibiting the notch.

Figs. 14, 15, 16, 17, 18, 19, Carpentry, plate I represent methods of joining one piece of timber to another, by dove-tailing, so that the surface of the one may be parallel and perpendicular to that of the other; these figures also represent various forms of cutting the dovetail, and are very useful in showing the mode of fixing angle-ties to wall plates, &c. &c. It is evident that timbers can be joined by this method either perpendicularly or obliquely.

Fig. 20, Carpentry, plate II., exhibits another method of fixing beams to wall plates, in order to bind the sides of the building together.

A piece of timber may be joined at right angles to another in the manner of fig. 21, which is a longitudinal section in the direction of the fibres of both pieces. A mortise is made in the one piece to correspond with its breadth, which is to form the perpendicular; the edge of the tenon is then cut with a dove-tail notch, so that the piece may be at right angles with the other, and a wedge or key is next driven from the other edge of the tenon, which forces it quite close. When the timber of which the piece containing the dovetail may be formed, is not quite dry, the tenon will shrink in proportion to its breadth, by which circumstance the perpendicular piece will become liable to be drawn out from the other to a certain degree. This defect is remedied in the section exhibited at fig. 22, where, instead of the edge of the tenon being cut in the form of a dovetail, a notch is made in it. Fig. 23, shows another view of the perpendicular piece with the wedge.

Figs. 24, 25, 26, exhibit the methods used for the meeting of a brace and straining piece under a truss beam. Of these methods the first is the best.

Fig. 27 exhibits a method of securing a collar beam at one extremity, and preventing it from being pulled away at the joint, by a bolt made to pass through the rafter, at the angle formed by their meeting.

Fig. 28 represents one form of the heel of a principal rafter, with the socket cut in the end of the tie beam to receive it; this method, however, is defective in strength, because the small part cut across the fibres of the beam being too near its extremity, it will become liable to be forced away, in consequence of its having to sustain the entire force of the rafter.

Fig. 29 is intended to remedy this defect, by forming two abutments equally deep into the beam; a mode which not only produces a resistance to the rafter, fully equal to that in the former method, but adds to it the strength of the intermediate part contained between the two abutments. The intermediate part in this mode, from having the fibres out across, is easily split away.

Another mode of forming a double resistance, is shown at fig. 30. In this figure it will be observed that the heels of the rafter and the socket are cut parallel to the fibres of the tie beam, the end of the rafter forming one abutment, and the tenon the other, which has the effect of removing it farther from the extremity.

Fig. 31 represents the best mode of forming a resistance on the heel of the rafter and socket at the extremity of the beam. The abutment, by this plan, is brought nearer to the inner part of the heel, which of course leaves a greater length on the end of the beam, and renders the resistance still greater than that produced by the wood. In order still further to strengthen and secure it, a strap may be placed round the extremity of the rafter, and the two ends may be bolted together, through the beam, as is represented in figs. 31 and 32.

Fig. 33 represents the mode of forming a junction of the rafters, and the joggle-head of the king-post, together with the manner of strapping them. This mode, however, will be found defective when the joggle-head of the king-post should happen to shrink; for it is evident, that in that case, the roof will descend, and consequently put it out of shape.

Fig. 34, introduced by Mr. Nicholson, shows a mode of forming a junction by making the rafters meet each other, without the intervention of the joggle-head, which is usually made to the king-post, and of course it has a great advantage over the preceding method.

Fig. 35, introduced by Mr. Nicholson, represents another mode of hanging king-posts to their principal rafters, which meet each other, as in fig. 11.

Instead of the forked strap, a bolt is used in this case with a spreading head, so as to form a shoulder perpendicular to the rafters, which are notched on purpose to receive it. This has the effect, also, of preventing the rafters of a roof from sinking in the middle. The whole may be made of iron, consisting of two parts connected together by means of a screw, which will draw the beam as high as may be required. No. 1 is part of the king-post with the bolt. Nos. 2 and 3 are parts of the rafters, and No. 4 presents a view of the upper edge of the rafters.

Figs. 36 and 37 exhibit the most approved forms for the abutments of the braces, at the lower part of the king's post.

Fig. 38 shows the form of an abutment, when the part which makes the resistance in the direction of the king-post is perpendicular to it, and sometimes another form of the abutment is used where the part of the shoulders which makes the resistance is perpendicular to the brace.

Mr. P. Nicholson has introduced a very valuable mode of connecting two braces with an iron king-post. It is effected by employing a small rod of iron sufficiently strong to bear up the middle of the beam, and to resist the force of the braces by the weight of the middle rafters. The strap, which prevents the braces from being pushed downwards, has an eye through each side, and the bottom of the king-rod is formed with a cross, equal in length to the thickness of the braces; this cross is perforated in its length to receive the bolt.

We come now to the consideration of floors A floor, in carpentry, is the timber-work for supporting the boards upon which we walk. A row of timbers employed in floors is called joisting. When a floor consists only of one row of timbers, it is called a common joist floor.

Framed floors are those where the ends of joists are supported by a large beam of timber, called a girder, which is mortised from each vertical side to receive the tenons which are cut on the ends of the joists. When a framed floor consists of only one row of joists, the floor is said to be single framed. When the joists on each side of the girder support another row of timbers, parallel to the girder, the floor is called a double floor. The row of timbers which are fastened to the girder by mortise and tenons are called binding joists, and those timbers which are supported by the binding joists, are called bridging joists. To a double framed floor there is another row of small timbers, attached to the binding joists, for supporting the lath and plaster; and are either nailed to the underside of the binding joists, or fixed to them by means of mortise and tenon.

In some single joisted floors every third or fourth joist is made deeper than the intermediate joists, and the ceiling joists are fixed to the deep joists, the one crossing the other at right angles. This construction is adapted to the prevention of sound, which must suffer an intermission by reason of the space between the timbers. As no timbers must enter a wall where there are fire-places or flues, the ends of the joists, instead of being supported by the wall at such places, must be supported by a piece of timber parallel thereto by mortise and tenons, and this piece of timber must be fixed by mortise and tenons at each end, to the nearest joists to such fire-place or flue; each of these joists is called a trimming joist, and the piece of timber which supports the joists leading to the fire-place or flues, is called a trimmer. As the trimming joists have also to support the intermediate joists, they ought to be in thickness equal to the breadth of the common joists, increased by a sixth part of that breadth.

In double floors, the under sides of the binding joists are frequently framed flush with the under-side of the girder, and about three or four inches below the top, in order to receive the bridging joists. Some old authors direct that the bridging joists should be pinned down to the binding joists; but this is unnecessary, and besides, it weakens the binding joists; this practice is therefore inadmissible.

It was formerly the practice to place the binding joists about three feet or three feet six inches distant from each other; the mean distance of the present practice is about five feet. Single floors, consisting of the same quantity of timber, are much stronger than framed floors; but a preference is sometimes given to framed floors in superior buildings, on account that they are not so liable to fracture the ceilings, and because they conduct sound more imperfectly than a common joist floor, and hence it is that single floors can only be employed in inferior buildings.

Framed floors differ from double floors only in the binding joists being framed to girders. In single floors, where the joists exceed eight feet bearing, pieces of board ought to be inserted in the spaces between the joists in a vertical position, and nearly the whole depth of the joists, and in one continued line at right angles to the joisting. The pieces of timber thus inserted are called struts, and the floor is said to be strutted, the struts ought not to be driven in with great force, but their ends should be in close contact with the vertical sides of the joists, and should be fixed thereto with a nail at each end.

onsists of only one row of joists, the floor is said
o be *single framed*. When the joists on each
de of the girder support another row of tim-
ers, parallel to the girder, the floor is called a
ouble floor. The row of timbers which are fas-
ned to the girder by mortise and tenons are
lled *binding joists*, and those timbers which
e supported by the binding joists, are called
idging joists. To a double framed floor there
another row of small timbers, attached to the
iding joists, for supporting the lath and plas-
; and are either nailed to the underside of
binding joists, or fixed to them by means of
rtise and tenon.

In some single joisted floors every third or
rth joist is made deeper than the intermediate
ts, and the ceiling joists are fixed to the deep
ts, the one crossing the other at right angles.
s construction is adapted to the prevention of
d, which must suffer an intermission by
on of the space between the timbers. As so
ers must enter a wall where there are fire-
es or flues, the ends of the joists, instead of
g supported by the wall at such places, must
upported by a piece of timber parallel
to by mortise and tenons, and this piece of
er must be fixed by mortise and tenons at
end, to the nearest joists to such fire-place
e; each of these joists is called a trimming
and the piece of timber which supports the
leading to the fire-place or flues, is called
mer. As the trimming joists have also to
rt the intermediate joists, they ought to be
kness equal to the breadth of the common
increased by a sixth part of that breadth.
double floors, the under sides of the bind-
sts are frequently framed flush with the
side of the girder, and about three or four
below the top, in order to receive the
g joists. Some old authors direct that

rtical sides of the joists, and should be
to with a nail at each end.

The strutting of a floor is of great use when the joists are thin and deep, in preventing their buckling pressure; but for this purpose there is another method called keying, which consists in framing short pieces of timber between the joists; but as the mortises which receive the tenons weaken the joists, and as the keys cannot be in a straight line, and since this method adds considerably to the expense, this practice is not so eligible as that of strutting. Single joist flooring may be used to any extent not exceeding sixteen feet; but when it is desirable to preserve the ceiling free from cracks, and to prevent the passage of sound, a framed floor is necessary.

The ceiling joists in double floors are generally put in after the building is up; if, therefore, they are fixed by means of mortises in the sides of the binding joists, to relieve tenons on their ends, the space between every other two mortises must be grooved out alternately upon the opposite sides of the two adjacent binding posts; by this means the ceiling posts may easily be put in their places by inserting the tenon in each ceiling joist in the mortises at one end, and sliding the tenon on the other end along the groove in the arc of a circle, until the ceiling joist come at a right angle with the binding joist. The long mortises or grooves in the sides of the binding joists are called chace mortises or pulley mortises. The ceiling joists may be thirteen or fourteen inches apart; the thickness of the bridging joists and ceiling joists need not be greater than what is sufficient to resist splitting by the driving in of the nails in order to fix them. It has been found by experience, that two inches is a sufficient thickness for the purpose.

In double framed floors, the distance of bridging joists in the clear ought to be about twelve inches, and should never exceed thirteen. It is a good practice to plane the upper edges of the bridging joists straight, because, when the boarding is laid, the faces for walking upon will be more regular than if the boards had been laid down upon the edges of the bridging joists when rough from the saw.

We have now to consider the subject of the strength of timber, one of the most important in the art of carpentry; since, without a due regard to it, no erections can possibly be made, but what depend solely on chance for their success. Yet, of all the branches of the science of architecture, none, perhaps, has received so little elucidation from the investigations of the learned. Nor will the cause of this seeming neglect appear problematical, when it is considered that there is none requiring such vast and expensive apparatus, more close and continued application, or more judgment and practical experience to obtain any decisive conclusions. Accordingly, in our own country, experiments have never been made on a scale sufficiently large to be of much importance as a guide in practice; and we owe to the liberality of the ancient monarchy of France nearly all the knowledge we possess on this most interesting subject. Messrs. Buffon and Du Hamel, about the middle of the last century, were directed by that government to make a variety of experiments; they were furnished with ample funds and apparatus, and all the forests of France were at their disposal for subjects. The reports of M. de Buffon may be found in the Memoirs of the French Academy for the years 1740, 1741, 1742, and 1760; and those of M. Du Hamel in his work, Sur l'Exploitation des Arbres, and sur le Conservation et la Transportation de Bois. The essential parts of them we shall notice presently.

The strength of all bodies consists in the cohesion of their particles, and as this cohesion admits of many modifications, in its various appearances of hardness, elasticity, and softness, the texture of bodies must be taken into account before we can arrive at mathematical demonstrations on the subject: and the experiments recorded, have been, for the reasons before assigned, so few, limited, and doubtful, as to produce no principles on which to ground our future calculations.

A general idea of the force of the attraction of cohesion may be obtained from the instance of a lever, in which, by the compression of one end, a strain is occasioned in a distant part. In order to understand its nature with precision it will be necessary to review such general laws as are immediately necessary as a guide in mechanical operations.

First. We have presumptive evidence to prove that all bodies are elastic in a certain degree, that is, when their form or bulk is changed by certain moderate compressions, it requires the continuance of the force producing the change, in order to continue the body in its altered state, and, when the compressing force is removed, the body recovers its original form and tension.

Secondly. That whatever may be the situation of the particles composing a body, with respect to each other when in a state of quiescence, they are kept in their respective places by the balance of opposing forces.

Thirdly. It is an established fact, that every body has some degree of compressibility, as well as of dilatability; and when the changes produced in its dimensions are so moderate, that the body completely recovers its original form on the cessation of the changing force, the extensions or compressions bear a sensible proportion to the extending or compressing forces; and, therefore, the connecting forces are proportioned to the distance, at which the particles are diverted, or separated, from their usual state of quiescence.

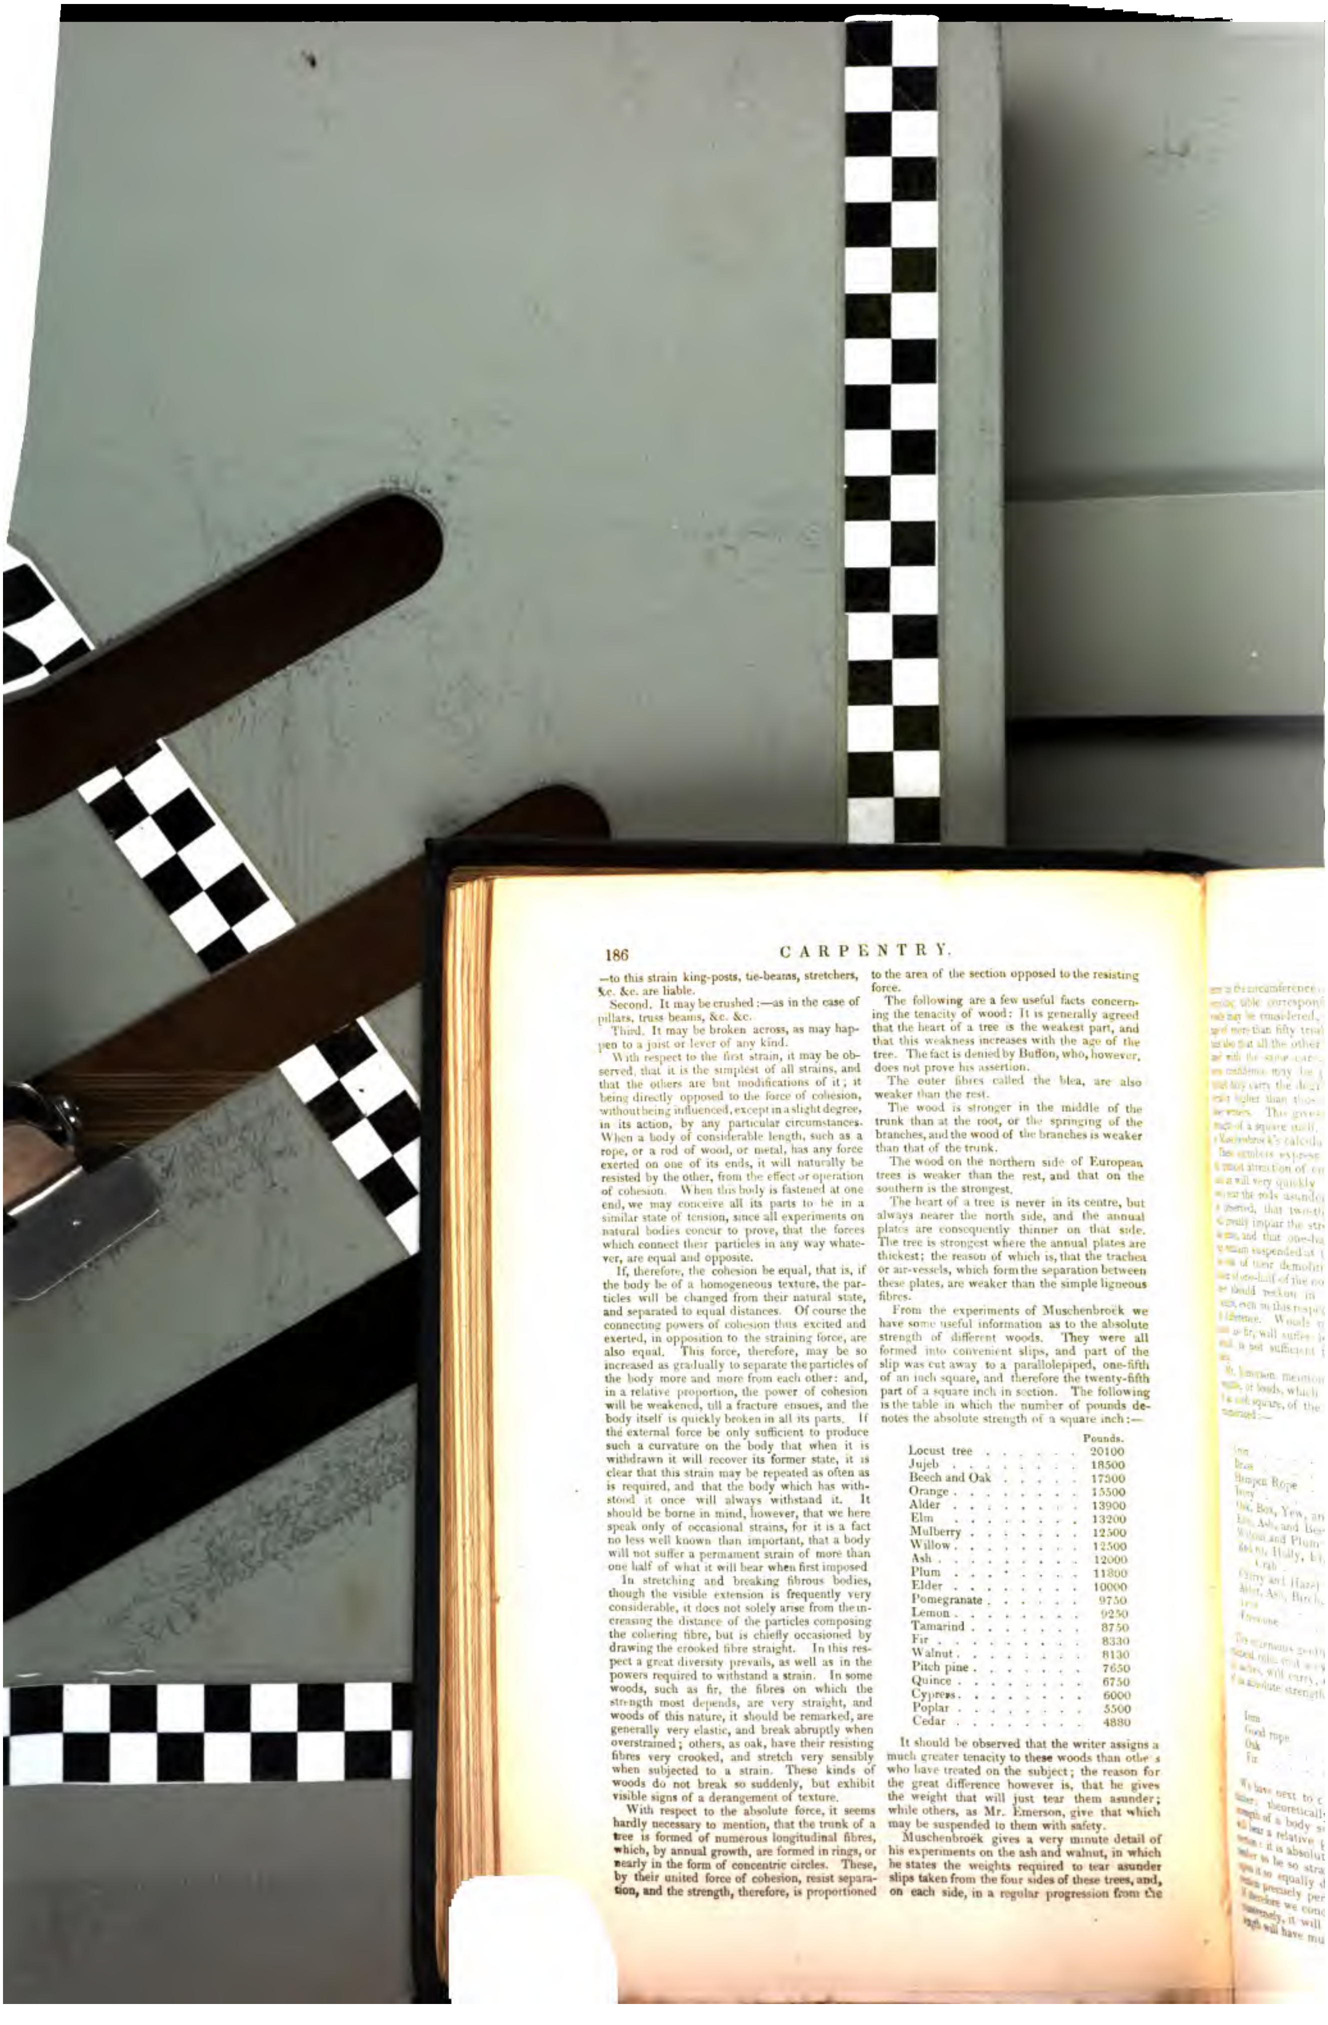
Fourthly. It is universally observable, that when the dilatations have proceeded to a certain length, a less addition of force is afterwards sufficient to increase the dilatation in the same degree. For instance, when a pillar of wood is overloaded, it swells out, and small crevices appear in the direction of the fibres. After this, it will not bear half of the previous load.

Fifthly. That the forces connecting the particles composing tangible or solid bodies, are altered by a variation of distance, not only in degree, but also in kind.

Having now enumerated the principal modes, in which cohesion confers strength on solid bodies, we proceed to consider the strains to which this strength may be opposed.

These strains are three in number, viz.—

First. A piece of matter may be torn asunder:



—to this strain king-posts, tie-beams, stretchers, &c. &c. are liable.

Second. It may be crushed:—as in the case of pillars, truss beams, &c. &c.

Third. It may be broken across, as may happen to a joist or lever of any kind.

With respect to the first strain, it may be observed, that it is the simplest of all strains, and that the others are but modifications of it; it being directly opposed to the force of cohesion, without being influenced, except in a slight degree, in its action, by any particular circumstances. When a body of considerable length, such as a rope, or a rod of wood, or metal, has any force exerted on one of its ends, it will naturally be resisted by the other, from the effect or operation of cohesion. When this body is fastened at one end, we may conceive all its parts to be in a similar state of tension, since all experiments on natural bodies concur to prove, that the forces which connect their particles in any way whatever, are equal and opposite.

If, therefore, the cohesion be equal, that is, if the body be of a homogeneous texture, the particles will be changed from their natural state, and separated to equal distances. Of course the connecting powers of cohesion thus excited and exerted, in opposition to the straining force, are also equal. This force, therefore, may be so increased as gradually to separate the particles of the body more and more from each other: and, in a relative proportion, the power of cohesion will be weakened, till a fracture ensues, and the body itself is quickly broken in all its parts. If the external force be only sufficient to produce such a curvature on the body that when it is withdrawn it will recover its former state, it is clear that this strain may be repeated as often as is required, and that the body which has withstood it once will always withstand it. It should be borne in mind, however, that we here speak only of occasional strains, for it is a fact no less well known than important, that a body will not suffer a permament strain of more than one half of what it will bear when first imposed

In stretching and breaking fibrous bodies, though the visible extension is frequently very considerable, it does not solely arise from the increasing the distance of the particles composing the cohering fibre, but is chiefly occasioned by drawing the crooked fibre straight. In this respect a great diversity prevails, as well as in the powers required to withstand a strain. In some woods, such as fir, the fibres on which the strength most depends, are very straight, and woods of this nature, it should be remarked, are generally very elastic, and break abruptly when overstrained; others, as oak, have their resisting fibres very crooked, and stretch very sensibly when subjected to a strain. These kinds of woods do not break so suddenly, but exhibit visible signs of a derangement of texture.

With respect to the absolute force, it seems hardly necessary to mention, that the trunk of a tree is formed of numerous longitudinal fibres, which, by annual growth, are formed in rings, or nearly in the form of concentric circles. These, by their united force of cohesion, resist separation, and the strength, therefore, is proportioned to the area of the section opposed to the resisting force.

The following are a few useful facts concerning the tenacity of wood: It is generally agreed that the heart of a tree is the weakest part, and that this weakness increases with the age of the tree. The fact is denied by Buffon, who, however, does not prove his assertion.

The outer fibres called the blea, are also weaker than the rest.

The wood is stronger in the middle of the trunk than at the root, or the springing of the branches, and the wood of the branches is weaker than that of the trunk.

The wood on the northern side of European trees is weaker than the rest, and that on the southern is the strongest.

The heart of a tree is never in its centre, but always nearer the north side, and the annual plates are consequently thinner on that side. The tree is strongest where the annual plates are thickest; the reason of which is, that the trachea or air-vessels, which form the separation between these plates, are weaker than the simple ligneous fibres.

From the experiments of Muschenbroek we have some useful information as to the absolute strength of different woods. They were all formed into convenient slips, and part of the slip was cut away to a parallelepiped, one-fifth of an inch square, and therefore the twenty-fifth part of a square inch in section. The following is the table in which the number of pounds denotes the absolute strength of a square inch:—

	Pounds.
Locust tree	20100
Jujeb	18500
Beech and Oak	17300
Orange	15500
Alder	13900
Elm	13200
Mulberry	12500
Willow	12500
Ash	12000
Plum	11800
Elder	10000
Pomegranate	9750
Lemon	9250
Tamarind	8750
Fir	8330
Walnut	8130
Pitch pine	7650
Quince	6750
Cypress	6000
Poplar	5500
Cedar	4880

It should be observed that the writer assigns a much greater tenacity to these woods than others who have treated on the subject; the reason for the great difference however is, that he gives the weight that will just tear them asunder; while others, as Mr. Emerson, give that which may be suspended to them with safety.

Muschenbroëk gives a very minute detail of his experiments on the ash and walnut, in which he states the weights required to tear asunder slips taken from the four sides of these trees, and, on each side, in a regular progression from the to the area of the section opposed to the resisting force.

The following are a few useful facts concerning the tenacity of wood: It is generally agreed that the heart of a tree is the weakest part, and that this weakness increases with the age of the tree. The fact is denied by Buffon, who, however, does not prove his assertion.

The outer fibres called the blea, are also weaker than the rest.

The wood is stronger in the middle of the trunk than at the root, or the springing of the branches, and the wood of the branches is weaker than that of the trunk.

The wood on the northern side of European trees is weaker than the rest, and that on the southern is the strongest.

The heart of a tree is never in its centre, but always nearer the north side, and the annual plates are consequently thinner on that side. The tree is strongest where the annual plates are thickest; the reason of which is, that the trachea or air-vessels, which form the separation between these plates, are weaker than the simple ligneous fibres.

From the experiments of Muschenbroek we have some useful information as to the absolute strength of different woods. They were all formed into convenient slips, and part of the slip was cut away to a parallolepiped, one-fifth of an inch square, and therefore the twenty-fifth part of a square inch in section. The following is the table in which the number of pounds denotes the absolute strength of a square inch:—

	Pounds.
Locust tree	20100
Jujeb	18500
Beech and Oak	17500
Orange	15500
Alder	13900
Elm	13200
Mulberry	12500
Willow	12500
Ash	12000
Plum	11800
Elder	10000
Pomegranate	9750
Lemon	9250
Tamarind	8750
Fir	8330
Walnut	8130
Pitch pine	7650
Quince	6750
Cypress	6000
Poplar	5500
Cedar	4880

It should be observed that the writer assigns a much greater tenacity to these woods than other who have treated on the subject; the reason for the great difference however is, that he gives the weight that will just tear them asunder, while others, as Mr. Emerson, give that which may be suspended to them with safety.

Muschenbroek gives a very minute detail of his experiments on the ash and walnut, in which he states the weights required to tear asunder slips taken from the four sides of these trees, and, on each side, in a regular progression from the

centre to the circumference. The numbers in the foregoing table corresponding with these two woods may be considered, therefore, as the average of more than fifty trials of each. He mentions also that all the other numbers were calculated with the same care. For these reasons some confidence may be placed in the results; though they carry the degrees of tenacity considerably higher than those enumerated by some other writers. This gives 8640 for the greatest strength of a square inch, which is much inferior to Muschenbroëk's calculation.

These numbers express something more than the utmost attraction of cohesion, the weights are such as will very quickly (that is in a minute or two) tear the rods asunder. In general it may be observed, that two-thirds of these weights will greatly impair the strength after a considerable time, and that one-half, is the utmost that can remain suspended at them, without incurring the risk of their demolition; and on this calculation of one-half of the nominal weight, the engineer should reckon in all his constructions; though, even in this respect, there are great shades of difference. Woods of a very straight fibre, such as fir, will suffer less injury from a load which is not sufficient to break them immediately.

Mr. Emerson mentions the following as the weights, or loads, which may be safely suspended to an inch square, of the several bodies hereafter enumerated :—

	Pounds.
Iron	76400
Brass	35600
Hempen Rope	19600
Ivory	15700
Oak, Box, Yew, and Plum tree	7850
Elm, Ash, and Beech	6070
Walnut and Plum	5360
Red fir, Holly, Elder, Plane, and Crab	5000
Cherry and Hazel	4760
Alder, Ash, Birch, and Willow	4290
Lead	430
Freestone	914

This ingenious gentleman has laid down as a practical rule, that a cylinder, whose diameter is six inches, will carry, when loaded to one-fourth of its absolute strength, as follows :—

	Cwt.
Iron	135
Good rope	22
Oak	14
Fir	9

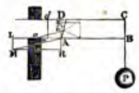
We have next to consider the compression of timber: theoretically speaking, the positive strength of a body suffering under compression will bear a relative proportion to the area of its section: it is absolutely impossible for a piece of timber to be so straight, and the weight acting upon it so equally disposed, as to press in a direction precisely perpendicular upon each fibre. If therefore we conceive the smallest force acting transversely, it will be easily imagined that the length will have much to do with the strength.

Parent has shown that the force required to crush a body, is nearly equal to that which will tear it asunder. He observes, also, that it requires something more than sixty pounds on every square line, to crush a piece of sound oak; but this rule is by no means general, glass, for instance, will carry a hundred times more on it than oak in this way, but will not bear suspended above four or five times as much. Oak will suspend a great deal more than fir, but fir, as a pillar, will carry twice as much. Woods of a soft texture, although they may be composed of very tenacious fibres, are more easily crushed by the load upon them. The softness of texture is chiefly owing to the crooked nature of their fibres, and to the existence of considerable vacuities between each fibre, so that they are more easily bent in a lateral direction and crushed. When a post is overstrained by its load, it is observed to increase sensibly in diameter.

The first author who has considered the compression of columns with attention is the celebrated Euler, who published, in the Berlin Memoirs for 1757, his theory of the strength of columns. The general proposition established by this theory is, that the strength of prismatic columns is in the direct quadruplicate ratio of their diameters and the inverse ratio of their lengths. He prosecuted this subject in the Petersburgh Commentaries for 1778, confirming his former theory. Muschenbroëk has compared the theory with experiments, but the comparison has been very unsatisfactory, the experiments neither confirming nor positively negativing the theory.

The next and most common strain to which bodies are exposed, is that which tends to break them across.

In strains of this kind it frequently happens, that the power of a lever is exerted in addition to the positive force of the strain.



Let A B C D, in the above diagram, be supposed to represent the vertical section of a prismatic solid, projecting horizontally from a wall in which it is firmly fixed; and let a weight be hung on it at B, or let any power act at B, in a direction perpendicular to A B.—Let this body be also considered to possess insuperable strength in every part, except in the vertical section D A, perpendicular to its length, in which section only it must break.—Let the cohesion be uniform throughout the whole of this section: that is, let each of the adjoining particles of the two parts cohere with an equal force *f*. There are two ways in which it may then break. The part A B C D, may simply slide down along the surface of the fracture, provided the power acting at B be equal to the accumulated force which is exerted by every particle composing the section, in the direction A D. But let this be supposed as effectually prevented by something supporting the point A. The action at P, tends to make the body turn round A (or round a horizontal line passing through A at right angles with A B) in the same manner as round a joint. This it cannot do without separating at the line D A, in which case the adjoining particles at D, or at E, will be separated horizontally. But their attraction of cohesion resists this separation. In order, therefore, that the fracture may happen at the place intended, the energy of the power P, acting by means of the lever A B, must be superior to the accumulated energies of the component particles. The energy of each depends not only on its cohesive, or connecting force, but also on its peculiar situation; for the supposed insuperable firmness of the rest of the body, renders it a lever turning round the fulcrum A, and the individual cohesive power of each particle, such as D or E, acts by means of the arm D A or E A. The precise energy of each particle will consequently be ascertained by multiplying the force individually exerted by it at the moment of fracture, by the arm of the lever which enables it to act.

Let us then suppose that, at the moment of fracture, every individual particle exerts an equal force f. The energy of D, will be $D A \times f$, that of F will be $E A \times f$, and that of the whole will be the sum of all these products. Let the depth D A of the section, be called d, and let any undetermined part of it, as A E, be called x, then the space occupied by any particle will be x. The cohesion of this space may be represented by $f x$, and that of the whole by $f d$. The energy by which each element x, of the line D A, or d, resists the fracture, will be $f x x$, and the whole accumulated energies will be $f \times \int x x$. This is well known to be $f \times \frac{1}{2} d^2$, or $f d \times \frac{1}{2} d$. It is the same thing, therefore, as if the cohesion, $f d$, of the whole section had been concentred together at the point G, which is in the middle of D A.

In the next place, we may remark, that a certain determinate curvature being suitable to every beam it cannot be exceeded without breaking it; since two adjoining particles are thereby separated, and an end is put to their cohesion. A fibre can be extended only to a certain degree of its length. The ultimate extension of the outer fibres must bear a certain proportion to its length, and this proportion is similar in the point of depth to the radius of ultimate curvature, which is, therefore, determinate. Consequently a beam of uniform breadth and depth, is most incurvated where the strain is greatest, and will necessarily break in the most incurvated part. But by changing its form, so as to render the strength of its different sections in the ratio of the strain, it is evident that the curvature will be the same throughout, or that it may be made to vary according to any law.

CARPENTUM, in antiquity, a name common to divers sorts of vehicles, answering to coaches, waggons, carts, &c. among us. The carpentum was originally a kind of car in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from carras; others from carmenta, by a conversion of the m into p.

CARPESIUM, in botany, a genus of the order polygamia superflua, and syngenesia class of plants; natural order forty-ninth, compositæ. Receptacle naked; downless: CAL. imbricate, the outer scales reflected; florets of the margin five-cleft. Species two; one native of the south of Europe, the other of China.

CAR'PET, *v.* & *n.* Ital. *carpetta;* Dutch *karpet.* A parti-colored covering, made of wool, to spread on a floor; formerly, the name was given to a table-cover. Poetically, it signifies level ground, adorned with flowers; and any variegated surface. The word is also proverbially used for an easy and luxurious state; a carpet knight is one who has never seen service. To be on the carpet is to be under consideration; to be in hand.

Be the Jacks fair within, the Jills fair without, *carpets* laid, and every thing in order? *Shakspeare.*

Go, signify as much, while here we march
Upon the grassy *carpet* of this plain. *Id.*

He is knight, dubbed with unhacked rapier, and upon *carpet* consideration. *Id.*

Against the wall, in the middle of the half pace, is a chair placed before him, with a table and *carpet* before it. *Bacon.*

We found him in a fair chamber, richly hanged and *carpeted* under foot, without any degrees in the state; he was set upon a low throne, richly adorned, and a rich cloth of state over his head, of blue sattin embroidered. *Bacon.*

In the year 1555, Chancelor made another voyage to this place, with letters from Queen Mary; had a house in Mosco, and diet appointed him; and was soon admitted to the emperor's presence in a large room spread with *carpets*; at his entering and salutation all stood up, the emperor only sitting, except when the queen's name was read, or spoken, for then he himself would rise; at dinner he sat bareheaded; his crown and a rich cap hanging on a pinnacle by. *Milton. History of Moscovia.*

The *carpet* ground shall be with leaves o'er spread,
And boughs shalt weave a covering for your head.
Dryden.

The whole dry land is, for the most part, covered over with a *carpet* of green grass and other herbs.
Ray.

One track led winding down a shelving dale,
All arch'd with bending branches over-head,
The other opening to the northern gale,
Wide and more wide its greenwood *carpet* spread.
Gay.

CARPET KNIGHTS, a denomination given to gown-men and others, of peaceable profession, who on account of their birth, office, or merits, are raised to the honor of knighthood.

I change
My thought, and hold thy valor light
As that of some vain *carpet knight.*
Scott's Lady of the Lake.

CARPI, a ci-devant principality of Modena, about four leagues from that city, included in the late Italian republic and dependency of the Crostolo. It formerly belonged to the house of Pio. In the beginning of the fourteenth century, Manfroy was the first prince of Carpi; but in the sixteenth, the emperor Charles V. gave it to Alfonzo duke of Ferrara.

CARPI, the capital of the above district is situated on the Sechia. It has a strong castle,

ARPI, a ci-devant principality of Modena, four leagues from that city, included in te Italian republic and dependency of the olo. It formerly belonged to the house of In the beginning of the fourteenth century Manfroy was the first prince of Carpi; but sixteenth, the emperor Charles V. gave it onzo duke of Ferrara.

arpi, the capital of the above district is d on the Sechia. It has a strong castle,

and lies tw ve miles north of Modena. Long. 11° 12′ E., lat. 11° 45′ N.

Carpi, a town of Italy, in the Veronese, included in the late republic, and dependency of Benaco; memorable for a victory gained by the imperialists over the French, in 1701. It is situated on the Adige, twenty-seven miles south of Verona.

Carpi (Girolamo da), history and portrait painter, born at Ferrara, in 1501, and a disciple of Garofalo. He acquired such an excellence in the imitation of Corregio's style, that many paintings copied by him were taken for originals, and eagerly purchased by the connoisseurs. Nor is it improbable, that several of his paintings pass at this day for the genuine works of Corregio. He died in 1556.

Carpi (Ugo da), an Italian painter, remarkable for being the inventor of that species of engraving on wood, distinguished by the name of chiaro scuro, in imitation of drawing. This is performed by using more blocks than one; and Ugo da Carpi usually had three; the first of the outline and dark shadows, the second for the lighter, and the third for the half tint. In that manner he struck off prints after several designs, and cartons of Raphael; particularly one of the Sybil, a descent from the cross, and the history of Simon the Sorcerer. He died in 1500.

CARPINUS, the horn-bean, in botany: a genus of the polyandria order, and monœcia class of plants; natural order fiftieth, amentaceæ: CAL. of the male monophyllous and ciliated; amentum, with roundish scales: COR. none, stamina twenty: CAL. of the female monophyllous and ciliated; amentum with oblong scales: COR. none, two germens, with two styles on each. The fruit is an angular nut. There are four species, viz. 1. C. betulus, or wych-hazel, a deciduous tree, much resembling the beech, native of Europe and America. As an underwood, it affords stakes and elders, fuel and charcoal. Its timber ranks with that of the beech and the sycamore; and the inner bark is said to be much used in Scandinavia to dye yellow. The only superior excellency of the horn-beam lies in its fitness for sheltering gardens, nurseries, and young plantations in winter. 2. C. ostrya, the hop horn-beam, a native of Italy and Virginia. This is of taller growth than the eastern kind, and will arrive to the height of twenty feet or more. 3. C. Virginiana. Common to this province of America; with lanceolate, pointed leaves, and very long cones. 4. C. duinensis; a native of Carniola; with the scales of its cones somewhat hearted, doubly toothed; female ament, ovate.

CARP'MEALS, *n. s.* A kind of coarse cloth made in the North of England.
Phillip's World of Words.

CARPOBALSAM, from καρπος, fruit, and βαλσαμος, balsam, in the materia medica, the fruit of the tree which yields the true oriental balsam. It is used in Egypt, in all the intentions in which the balsam itself is applied. The only use the Europeans make of it is in Venice treacle and mithridate; and in these not a great deal, for cubebs and juniper berries are generally substituted in its place.

CARPOCRATES, a heretic of the second century, who revived and added to the errors of Simon Magus, Menander, Saturninus, and other Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature was unknown. The world, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women.

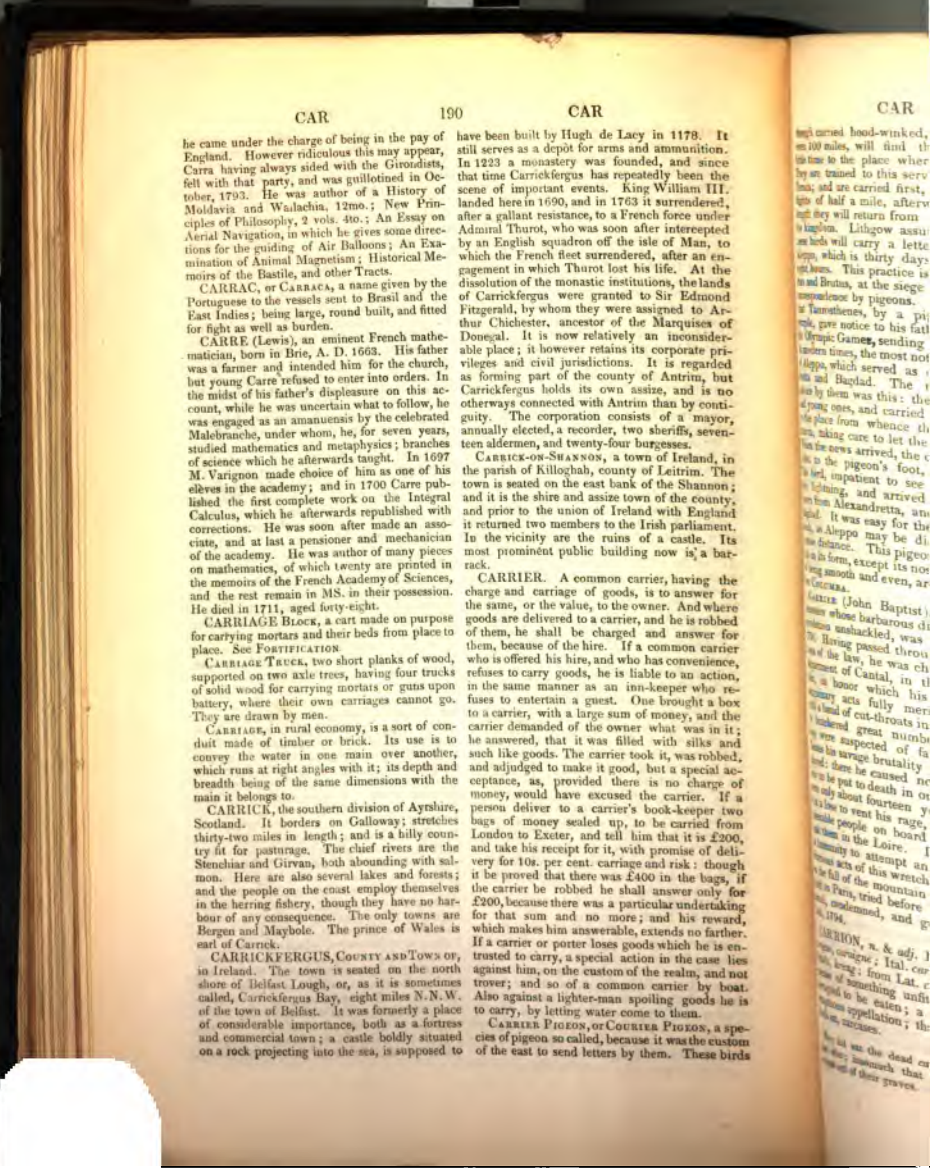
CARPOLITHI, or fruit-stone rocks of the Germans, are composed of a kind of jasper, of the nature of the amygdaloides, or almond stones. Bertrand asserts that the latter appear to be composed of elliptical pieces like petrified almonds, though in truth they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small muscle shells connected by a stony concretion. The name carpolithi, however, is given in general by writers on fossils to all stony concretions that resemble fruit of any kind.

CAR'PUS, *n. s.*, Lat., the wrist; so named by anatomists, which is made up of eight little bones, of different figures and thickness, placed in two ranks, four in each rank. They are strongly tied together by the ligaments which come from the radius, and by the annulary ligaments. See ANATOMY. *Quincy.*

I found one of the bones of the *carpus* lying loose in the wound. *Wiseman's Surgery.*

CARR (Sir John), a late travelling attorney, originally of Dorsetshire, who amused the public as a tourist, and in a celebrated trial for libel. His first publication was, The Stranger in France, 4to, 1803, which becoming popular was followed by A Tour round the Baltic, 1805; The Stranger in Ireland, 1806; A Tour through Holland, down the Rhine, &c. 1807; and A Tour through Scotland, 1809. In Ireland he was knighted by the lord lieutenant, a circumstance which, together with his general literary pretensions, became the topic of witty ridicule in My Pocket Book, or Hints for a Ryghte Merrie and Conceitede Tour, to be called The Stranger in Ireland. This jeu-d'esprit was foolishly enough made the ground of a prosecution for libel, in which the knight was unsuccessful. A small volume of Poems also bears Sir John Carr's name.

CARRA (John Lewis), a noted actor in the French revolution, was born at Pont de Vesles, in 1743, and bred to the law, but quitted that profession in pursuit of letters. Previous to the breaking out of the revolution, he travelled as far as Moldavia, and there became secretary to the hospodar. Returning to France about the beginning of the political ferment he became the publisher of a journal, entitled Les Annales Politiques et Litteraires, which was widely circulated, and procured Carra's appointment as one of the keepers of the national library; and he was afterwards nominated a member of the convention. He was distinguished by the keenness of his temper, and was employed as a commissioner to the army; but having, as was said, proposed to proscribe the Bourbon family and place the duke of York on the throne of France,



he came under the charge of being in the pay of England. However ridiculous this may appear, Carra having always sided with the Girondists, fell with that party, and was guillotined in October, 1793. He was author of a History of Moldavia and Walachia, 12mo.; New Principles of Philosophy, 2 vols. 4to.; An Essay on Aerial Navigation, in which he gives some directions for the guiding of Air Balloons; An Examination of Animal Magnetism; Historical Memoirs of the Bastile, and other Tracts.

CARRAC, or Carraca, a name given by the Portuguese to the vessels sent to Brasil and the East Indies; being large, round built, and fitted for fight as well as burden.

CARRE (Lewis), an eminent French mathematician, born in Brie, A. D. 1663. His father was a farmer and intended him for the church, but young Carre refused to enter into orders. In the midst of his father's displeasure on this account, while he was uncertain what to follow, he was engaged as an amanuensis by the celebrated Malebranche, under whom, he, for seven years, studied mathematics and metaphysics; branches of science which he afterwards taught. In 1697 M. Varignon made choice of him as one of his elèves in the academy; and in 1700 Carre published the first complete work on the Integral Calculus, which he afterwards republished with corrections. He was soon after made an associate, and at last a pensioner and mechanician of the academy. He was author of many pieces on mathematics, of which twenty are printed in the memoirs of the French Academy of Sciences, and the rest remain in MS. in their possession. He died in 1711, aged forty-eight.

CARRIAGE Block, a cart made on purpose for carrying mortars and their beds from place to place. See Fortification.

Carriage Truck, two short planks of wood, supported on two axle trees, having four trucks of solid wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men.

Carriage, in rural economy, is a sort of conduit made of timber or brick. Its use is to convey the water in one main over another, which runs at right angles with it; its depth and breadth being of the same dimensions with the main it belongs to.

CARRICK, the southern division of Ayrshire, Scotland. It borders on Galloway; stretches thirty-two miles in length; and is a hilly country fit for pasturage. The chief rivers are the Stenchiar and Girvan, both abounding with salmon. Here are also several lakes and forests; and the people on the coast employ themselves in the herring fishery, though they have no harbour of any consequence. The only towns are Bergen and Maybole. The prince of Wales is earl of Carrick.

CARRICKFERGUS, County and Town of, in Ireland. The town is seated on the north shore of Belfast Lough, or, as it is sometimes called, Carrickfergus Bay, eight miles N.N.W. of the town of Belfast. It was formerly a place of considerable importance, both as a fortress and commercial town; a castle boldly situated on a rock projecting into the sea, is supposed to have been built by Hugh de Lacy in 1178. It still serves as a depôt for arms and ammunition. In 1223 a monastery was founded, and since that time Carrickfergus has repeatedly been the scene of important events. King William III. landed here in 1690, and in 1763 it surrendered, after a gallant resistance, to a French force under Admiral Thurot, who was soon after intercepted by an English squadron off the isle of Man, to which the French fleet surrendered, after an engagement in which Thurot lost his life. At the dissolution of the monastic institutions, the lands of Carrickfergus were granted to Sir Edmond Fitzgerald, by whom they were assigned to Arthur Chichester, ancestor of the Marquises of Donegal. It is now relatively an inconsiderable place; it however retains its corporate privileges and civil jurisdictions. It is regarded as forming part of the county of Antrim, but Carrickfergus holds its own assize, and is no otherways connected with Antrim than by contiguity. The corporation consists of a mayor, annually elected, a recorder, two sheriffs, seventeen aldermen, and twenty-four burgesses.

Carrick-on-Shannon, a town of Ireland, in the parish of Killoghah, county of Leitrim. The town is seated on the east bank of the Shannon; and it is the shire and assize town of the county, and prior to the union of Ireland with England it returned two members to the Irish parliament. In the vicinity are the ruins of a castle. Its most prominent public building now is a barrack.

CARRIER. A common carrier, having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an inn-keeper who refuses to entertain a guest. One brought a box to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks and such like goods. The carrier took it, was robbed, and adjudged to make it good, but a special acceptance, as, provided there is no charge of money, would have excused the carrier. If a person deliver to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and tell him that it is £200, and take his receipt for it, with promise of delivery for 10s. per cent. carriage and risk: though it be proved that there was £400 in the bags, if the carrier be robbed he shall answer only for £200, because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a carrier or porter loses goods which he is entrusted to carry, a special action in the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. Also against a lighter-man spoiling goods he is to carry, by letting water come to them.

Carrier Pigeon, or Courier Pigeon, a species of pigeon so called, because it was the custom of the east to send letters by them. These birds have been built by Hugh de Lacy in 1178. It still serves as a depòt for arms and ammunitio In 1223 a monastery was founded, and sinc that time Carrickfergus has repeatedly been the scene of important events. King William III landed here in 1690, and in 1763 it surrendered, after a gallant resistance, to a French force unde Admiral Thurot, who was soon after intercepted by an English squadron off the isle of Man, in which the French fleet surrendered, after an engagement in which Thurot lost his life. At the dissolution of the monastic institutions, the lands of Carrickfergus were granted to Sir Edward Fitzgerald, by whom they were assigned to Arthur Chichester, ancestor of the Marquises of Donegal. It is now relatively an inconsiderable place; it however retains its corporate privileges and civil jurisdictions. It is regarded as forming part of the county of Antrim, but Carrickfergus holds its own assize, and is no otherways connected with Antrim than by contiguity. The corporation consists of a mayor, annually elected, a recorder, two sheriffs, seventeen aldermen, and twenty-four burgesses.

Carrick-on-Shannon, a town of Ireland, in the parish of Killoghah, county of Leitrim. The town is seated on the east bank of the Shannon; and it is the shire and assize town of the county, and prior to the union of Ireland with England it returned two members to the Irish parliament. In the vicinity are the ruins of a castle. Its most prominent public building now is a barrack.

CARRIER. A common carrier, having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an inn-keeper who refuses to entertain a guest. One brought a bag to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks and such like goods. The carrier took it, was robbed, and adjudged to make it good, but a special acceptance, as, provided there is no charge of money, would have excused the carrier. If a person deliver to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and tell him that it is £200, and take his receipt for it, with promise of delivery for 10s. per cent. carriage and risk: though it be proved that there was £400 in the bags, if the carrier be robbed he shall answer only for £200, because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a carrier or porter loses goods which he is entrusted to carry, a special action in the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. Also against a lighter-man spoiling goods he is to carry, by letting water come to them.

Carrier Pigeon, or Courier Pigeon, a species of pigeon so called, because it was the custom of the east to send letters by them. These birds though carried hood-winked, twenty, thirty, or even 100 miles, will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is thirty days' journey, in forty-eight hours. This practice is very ancient; Hirtius and Brutus, at the siege of Modena, held a correspondence by pigeons. And Ovid tells us, that Taurosthenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic Games, sending it to him at Ægina. In modern times, the most noted were the pigeons of Aleppo, which served as couriers at Alexandretta and Bagdad. The manner of sending advice by them was this: they took pairs which had young ones, and carried them on horseback to the place from whence they wished them to return, taking care to let them have a full view. When the news arrived, the correspondent tied a billet to the pigeon's foot, and let her loose. The bird, impatient to see its young, flew off like lightning, and arrived at Aleppo in ten hours from Alexandretta, and in two days from Bagdad. It was easy for them to find their way back, as Aleppo may be discovered at an immense distance. This pigeon has nothing peculiar in its form, except its nostrils, which, instead of being smooth and even, are swelled and rough. See Columba.

Carrier (John Baptist), one of the many monsters whose barbarous disposition the French revolution unshackled, was born at Aurillac, in 1756. Having passed through the inferior functions of the law, he was chosen deputy for the department of Cantal, in the national convention, an honor which his denunciations and sanguinary acts fully merited. He was sent with a band of cut-throats into La Vendee, where he butchered great numbers, merely because they were suspected of favoring royalty. At Nantes his savage brutality was particularly displayed: there he caused no fewer than twenty-four to be put to death in one day, four of whom were only about fourteen years of age; and, as if at a loss to vent his rage, he forced crowds of miserable people on board covered barges, and sunk them in the Loire. It would be shocking to humanity to attempt an enumeration of the ferocious acts of this wretch and his savage crew: on the fall of the mountain party he was ordered back to Paris, tried before the revolutionary tribunal, condemned, and guillotined, December 15th, 1794.

CAR'RION, *n.* & *adj.* Fr. *charogne*; old Fr. *carogne*, *caroigne*; Ital. *carogna*; *Span. carrona*; Dutch, *kreng*; from Lat. *caro* and *rodens*. The carcase of something unfit for food; flesh too corrupted to be eaten; a reproachful and contemptuous appellation; that which relates to, or feeds on, carcases.

They did eat the dead *carrions*, and one another soon after; insomuch that the very carcases they scraped out of their graves. *Spenser on Ireland.*

It is I,
That, lying by the violets in the sun,
Do as the *carrion* does, not as the flower. *Shakspeare.*

This foul deed shall smell above the earth,
With *carrion* men groaning for burial. *Id.*

Shall we send that foolish *carrion*, Mrs. Quickly, to him, and excuse his throwing into the water? *Id.*

Match to match I have encountered him,
And made a prey for *carrion* kites, and crows,
Even of the bonny beast he loved so well. *Id.*

Not all the pride that makes thee swell,
As big as thou dost, blown up veal;
Nor all thy tricks and slights to cheat,
Sell all thy *carrion* for good meat. *Hudibras*

Sheep, oxen, horses fall; and heaped on high
The differing species in confusion lie;
Till, warned by frequent ills, the way they found
To lodge their loathsome *carrion* in the ground.
Dryden.

The wolves will get a breakfast by my death,
Yet scarce enough their hunger to supply;
For love has made me *carrion* ere I die. *Id.*

Criticks, as they are birds of prey, have ever a natural inclination to *carrion*. *Pope.*

The sexton's indignation moved
The mean comparison reproved,
Their undiscerning palate blamed,
Which two-legged *carrion* thus defamed. *Gay.*

For this was all thy caution!
For this, thy painful labours at the glass?
To' improve those charms, and keep them in repair,
For which the spoiler thanks thee not. Foul feeder!
Coarse fare and *carrion* please thee full as well. *Blair.*

Blest genius! who bestows his toil and pains
On each dull passage each dull book contains;
The toil more grateful, as the task more low:
So *carrion* is the quarry of a crow. *Mallet.*

CARROBALISTA, in the ancient military art, denotes a species of balista, mounted on wheels, and drawn by horses; by which, it differed from the manubalista, which being lesser and lighter, was drawn by the hand.

CARROCERUM, or Carrocium, in writers of the middle age, denotes the banner or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARRON, a river of Scotland, in Stirlingshire, which rises about the middle of the isthmus, between the friths of Forth and Clyde, and divides that country into two nearly equal parts. The whole length of its course from west to east is not above fourteen miles. It falls into the Frith of Forth about three miles north-east of Falkirk. There is no river in Scotland, and few in the whole island of Britain, whose banks have been the scenes of more memorable transactions; and latterly this stream has given name to the celebrated Carron iron works. See Stirlingshire.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea; so named from the Carron. See Gunnery.

CARROOR, or Caroor, a town and fort of Hindostan, in the Mysore. It was entered by general Meadows, in June, 1790, having been evacuated by the troops of Tippoo Sultan. It is sixty-five miles east by south of Coimbetore.

CARROSSA, a considerable town of Italy, in the late Italian republic, and department of the Adda, situated on the Po, opposite Piacenza, where general Buonaparte passed the Po with his army, almost without resistance, on the 7th of May, 1796.

CAR'ROT, *n.*
CAR'ROTINESS, *n.*
CAR'ROTY, *adj.*
Fr. *carotte*; barb. Lat. *carota*, supposed to be from *καρρίζα*, for *καῤῥ* *ῥίζα*, the yellow root; an esculent root, of an orange color. Carrotiness and carroty are applied to red hair, from the resemblance which its color bears to that of the vegetable.

Carrots, though garden roots, yet they do well in the fields for seed. *Mortimer.*

His spouse orders the sack to be immediately opened, and greedily pulls out of it half a dozen bunches of *carrots*. *Dennis.*

If the potatoe's taste delights,
Or the red *carrots'* sweet invites,
Indulge thy morn and evening hours,
But let due care regard my flowers. *Gay.*

CARROT, in botany. See DAUCUS.

CAR'ROWS, *n.* an Irish word, which the quotation from Spenser fully defines.

The *carrows* are a kind of people that wander up and down to gentlemen's houses, living only upon cards and dice; who, though they have little or nothing of their own, yet will they play for much money. *Spenser on Ireland.*

CARRUCA, from carrus, Lat., in antiquity, a splendid kind of car or chariot, mounted on four wheels, richly decorated with gold, silver, ivory, &c., in which the emperors, senators, &c., were carried. Carruca is also used in writers of the middle age, for plough; and sometimes for Carrucate.

CARRUCAGE, carucagium, a kind of tax anciently imposed on every plough. It also denotes, in husbandry, the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for woad, dyer's weed, rape, and the like.

CARRUCATE, carrucata, in our ancient laws, a plough-land, or as much arable ground as can be tilled in a year with one plough. In Doomsday Inquisition, the arable land is estimated in carrucates, the pasture in hides, and meadow in acres.

CA'RRY, *v. a.* & *n.*
CA'RRIAGE, *n.*
CA'RRIER, *n.*
CA'RRY-TALE, *n.*
Fr. *charier*; from Lat. *currus*, says Dr. Johnson. In Span. *accarear* signifies to carry or convey something in a cart, or other carriage. But Serenius refers the origin of the word to Sw. *köra* (pronounced *kura*), to carry, to drive; *kerra*; a vehicle; Goth. *kera*. The verb to carry is of such various signification, that, after having explained the words springing from it, we shall give Dr. Johnson's definitions, with some additional authorities; as to alter them would, in this case, be merely to make a change without effecting an improvement.

Carriage denotes the act of carrying; conquest or acquisition, but this meaning is now obsolete, although we still say the enemy carried the place; a vehicle; a frame for holding cannon; behaviour; personal manners; conduct, practices, and manner of transacting; which last sense, also, is now obsolete. A carrier is whatever carries, but is chiefly used to mark one whose trade it is to convey goods for others. It is likewise the distinctive name of a species of pigeon, which is taught to carry letters, and whose services, once devoted to lovers and friends, are now chiefly employed by the boxing and gambling tribe. What a carry-tale is, every one's experience has enabled him to define and despise.

The unequal agitation of winds, though material to the *carriage* of sounds farther or less way, yet do not confound the articulation. *Bacon.*

Before his eyes he did cast a mist, by his own insinuations, and by the *carriage* of his youth, that expressed a natural princely behaviour. *Id.*

The manner of *carriage* of the business, was as if there had been secret inquisition upon him. *Id.*

You must distinguish between the motion of the air, which is but a vehiculum causæ, a *carrier* of the sounds, and the sounds conveyed. *Id.*

You may hurt yourself; nay, utterly
Grow from the king's acquaintance by this *carriage*. *Shakspeare.*

Solyman resolved to besiege Vienna, in good hope that, by the *carriage* away of that, the other cities would without resistance be yielded. *Knolles.*

He commanded the great ordnance to be laid upon *carriages*, which before lay bound in great unwieldy timber. *Id.*

There are tame and wild pigeons; and of tame there are croppers, *carriers*, runts. *Walton.*

He advised the new governor to have so much discretion in his *carriage*, that there might be no notice taken of the exercise of his religion. *Clarendon.*

If it seem so strange to move this obelisk for so little space, what may we think of the *carriage* of it out of Egypt? *Wilkins.*

Though in my face there's no affected frown,
Nor in my *carriage* a feigned niceness shown,
I keep my honour still without a stain. *Dryden.*

For winds, when homeward they return, will drive
The loaded *carriers* from their evening hive. *Id.*

The welcome news is in the letter found;
The *carrier's* not commissioned to expound;
It speaks itself. *Id.*

Let them have ever so learned lectures of breeding, that which will most influence their *carriage* will be the company they converse with, and the fashion of those about him. *Locke.*

The roads are crowded with *carriers*, laden with rich manufactures. *Swift.*

A *carrier* every night and morn
Would see his horses eat their corn;
This sunk the hostler's vails, 'tis true,
But then his horses had their due. *Gay.*

What horse or *carriage* can take up and bear away all the loppings of a branchy tree at once. *Watts.*

We shall now proceed to the verb, which in its active and neuter states, has nearly forty different shades of meaning. To carry is, to convey from a place; opposed to bring, or convey *to* a place; often with a particle, signifying departure, as *away*, *off*.

When he dieth he shall *carry* nothing *away*. *Psalm* xlix. 18.

And devout men *carried* Stephen to his burial. *Acts*, viii. 2.

I mean to *carry* her away this evening by the help of these two soldiers. *Dryden's Spanish Friar*

As in a hive's vimineous dome,
Ten thousand bees enjoy their home;
Each does her studious action vary,
To go and come, to fetch and *carry*. *Prior.*

They exposed their goods with the price marked, then retired, the merchants came, left the price which though carried hood-winked, twenty, thirty, or even 100 miles, will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is thirty days' journey, in forty-eight hours. This practice is very ancient; Hirtius and Brutus, at the siege of Modena, held a correspondence by pigeons. And Ovid tells us, that Taurosthenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic Games, sending it to him at Ægina. In modern times, the most noted were the pigeons of Aleppo, which served as couriers at Alexandretta and Bagdad. The manner of sending advice by them was this: they took pairs which had young ones, and carried them on horseback to the place from whence they wished them to return, taking care to let them have a full view. When the news arrived, the correspondent tied a billet to the pigeon's foot, and let her loose. The bird, impatient to see its young, flew off like lightning, and arrived at Aleppo in ten hours from Alexandretta, and in two days from Bagdad. It was easy for them to find their way back, as Aleppo may be discovered at an immense distance. This pigeon has nothing peculiar in its form, except its nostrils, which, instead of being smooth and even, are swelled and rough. See COLUMBA.

CARRIER (John Baptist), one of the many monsters whose barbarous disposition the French revolution unshackled, was born at Aurillac, in 1756. Having passed through the inferior functions of the law, he was chosen deputy for the department of Cantal, in the national convention, an honor which his denunciations and sanguinary acts fully merited. He was sent with a band of cut-throats into La Vendee, where he butchered great numbers, merely because they were suspected of favoring royalty. At Nantes his savage brutality was particularly displayed: there he caused no fewer than twenty-four to be put to death in one day, four of whom were only about fourteen years of age; and, as if at a loss to vent his rage, he forced crowds of miserable people on board covered barges, and sunk them in the Loire. It would be shocking to humanity to attempt an enumeration of the ferocious acts of this wretch and his savage crew: on the fall of the mountain party he was ordered back to Paris, tried before the revolutionary tribunal, condemned, and guillotined, December 15th, 1794.

CAR'RION, *n.* & *adj.* Fr. *charogne*; old Fr. *charoigne*, *caroigne*; Ital. *carogna*; *Span. carrona*; Dutch, *kreng*; from Lat. *caro* and *rodens*. The carcase of something unfit for food; flesh too corrupted to be eaten; a reproachful and contemptuous appellation; that which relates to, or feeds on, carcases.

They did eat the dead *carrions*, and one another soon after; insomuch that the very carcases they scraped out of their graves. *Spenser on Ireland.*

It is I,
That, lying by the violets in the sun,
Do as the *carrion* does, not as the flower. *Shakspeare.*

This foul deed shall smell above the earth,
With *carrion* men groaning for burial. *Id.*

Shall we send that foolish *carrion*, Mrs. Quickly, to him, and excuse his throwing into the water? *Id.*

Match to match I have encountered him,
And made a prey for *carrion* kites, and crows,
Even of the bonny beast he loved so well. *Id.*

Not all the pride that makes thee swell,
As big as thou dost, blown up veal;
Nor all thy tricks and slights to cheat,
Sell all thy *carrion* for good meat. *Hudibras*

Sheep, oxen, horses fall; and heaped on high
The differing species in confusion lie;
Till, warned by frequent ills, the way they found
To lodge their loathsome *carrion* in the ground.
Dryden.

The wolves will get a breakfast by my death,
Yet scarce enough their hunger to supply;
For love has made me *carrion* ere I die. *Id.*

Criticks, as they are birds of prey, have ever a natural inclination to *carrion*. *Pope.*

The sexton's indignation moved
The mean comparison reproved,
Their undiscerning palate blamed,
Which two-legged *carrion* thus defamed. *Gay.*

For this was all thy caution?
For this, thy painful labours at the glass?
To' improve those charms, and keep them in repair,
For which the spoiler thanks thee not. Foul feeder!
Coarse fare and *carrion* please thee full as well. *Blair.*

Blest genius! who bestows his toil and pains
On each dull passage each dull book contains;
The toil more grateful, as the task more low:
So *carrion* is the quarry of a crow. *Mallet.*

CARROBALISTA, in the ancient military art, denotes a species of balista, mounted on wheels, and drawn by horses; by which, it differed from the manubalista, which being lesser and lighter, was drawn by the hand.

CARROCERUM, or CARROCIUM, in writers of the middle age, denotes the banner or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARRON, a river of Scotland, in Stirlingshire, which rises about the middle of the isthmus, between the friths of Forth and Clyde, and divides that country into two nearly equal parts. The whole length of its course from west to east is not above fourteen miles. It falls into the Frith of Forth about three miles north-east of Falkirk. There is no river in Scotland, and few in the whole island of Britain, whose banks have been the scenes of more memorable transactions; and latterly this stream has given name to the celebrated Carron iron works. See STIRLINGSHIRE.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea; so named from the Carron. See GUNNERY.

CARROOR, or CAROOR, a town and fort of Hindostan, in the Mysore. It was entered by general Meadows, in June, 1790, having been evacuated by the troops of Tippoo Sultan. It is sixty-five miles east by south of Coimbetore.

CARROSSA, a considerable town of Italy, in the late Italian republic, and department of the Adda, situated on the Po, opposite Piacenza, To contain; to comprise.

He thought it *carried* something of an argument in it, to prove that doctrine. *Watts on the Mind.*

To have annexed; to have anything joined: with the particle *with*.

There was a righteous and a searching law, directly forbidding such practices; and they knew that it *carried with* it the divine stamp. *South.*

The obvious portions of extension that affect our senses, *carry with* them into the mind the idea of finite. *Locke.*

To convey or bear anything united or adhering, by communication of motion.

We see also manifestly, that sounds are *carried* with wind: and therefore sounds will be heard further with the wind than against the wind. *Bacon's Natural History.*

To move or continue anything in a certain direction

His chimney is *carried* up through the whole rock, so that you see the sky through it, notwithstanding the rooms lie very deep. *Addison on Italy.*

To push on ideas, arguments, or anything successive in a train.

Manethes, that wrote of the Egyptians, hath *carried* up their government to an incredible distance. *Hale's Origin of Mankind.*

To receive; to endure: not in use.

Some have in readiness so many odd stories, as there is nothing but they can wrap it into a tale, to make others *carry* it with more pleasure. *Bacon.*

To convey by means of something supporting.

Carry camomile, or wild thyme, or the green strawberry, upon sticks, as you do hops upon poles. *Bacon's Nat. Hist.*

To bear, as trees.

Set them a reasonable depth, and they will *carry* more shoots upon the stem. *Bacon's Nat. Hist.*

To fetch and bring, as dogs.

Young whelps learn easily to *carry*; young popinjays learn quickly to speak. *Ascham's Schoolmaster.*

To carry off. To kill.

Old Parr lived to one hundred and fifty-three years of age, and might have gone further if the change of air had not *carried* him *off*. *Temple.*

To carry on. To promote; to help forward.

It *carries on* the same design that is promoted by authors of a graver turn, and only does it in another manner. *Addison.*

To carry on. To continue; to put forward from one stage to another.

Æneas's settlement in Italy was *carried on* through all the oppositions in his way to it, both by sea and land. *Addison.*

To carry on. To prosecute; not to let cease.

France will not consent to furnish us with money sufficient to *carry on* the war. *Temple.*

To carry through. To support; to keep from falling, or being conquered.

That grace will *carry* us if we do not wilfully betray our succours, victoriously *through* all difficulties. *Hammond.*

To Carry, *v. n.* A hare is said by hunters to carry, when she runs on rotten ground, or on frost, and it sticks to her feet.

2. A horse is said to carry well, when his neck is arched, and he holds his head high; but when his neck is short, and ill shaped, and he lowers his head, he is said to carry low.

Carrying Wind, a term applied by dealers in horses to one that frequently tosses his nose as high as his ears, and does not carry handsomely. The difference between carrying in the wind, and beating upon the hand, is this: that the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low; and even between these two there is a difference in wind.

CARSTAIRS (William), an eminent Scotch divine, was the son of a clergyman, and born at a village near Glasgow in 1649. He studied theology; and the persecutions and oppressions of government, both in regard to civil and religious liberty, having excited his strongest indignation, he went to Utrecht. During his residence abroad, he became acquainted with pensionary Fagel, and entered with warmth into the interest of the prince of Orange. On his return to Scotland to procure a license, he became disgusted with the insolent conduct of archbishop Sharp, and went back to Holland. His prudence, his reserve, and his political address, were strong recommendations to the prince of Orange; who employed him in personal negociations in Holland, England, and Scotland. Upon the elevation of his master to the British throne, he was appointed the king's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should be established there. Carstairs, more versant in the affairs of his native country, saw all the impropriety of this project, and the danger that would arise from enforcing it. His reasonings, his remonstrances, his intreaties, overcame the firmness of king William. He yielded to considerations founded alike in policy and in prudence; and to Carstairs Scotland is indebted for the full establishment of its church in the Presbyterian form of government. The death of king William was a severe affliction to him; and it happened before that prince had provided for him with the liberality he deserved. He was continued, however, in his office by queen Anne; and was appointed principal to the University of Edinburgh. He was one of the ministers of the city, and four times moderator of the general assembly. His influence and activity were also exerted with success in promoting the arts and sciences. The universities of Scotland owe him the highest obligations. He procured for them an augmentation of the salaries of their professors; a circumstance to which may be ascribed their reputation, as it enabled them to cultivate with spirit the different branches of knowledge. His religion had no mixture of austerity; his secular transactions were attended with no imputation of artifice; and the versatility of his talents made him pass with ease from a court to a college. He was among the last who suffered torture before the privy council, to make him divulge the secrets entrusted to him, which he firmly resisted; and after the revolution, that

the secrets entrusted to him, which
sisted; and after the revolution, the

inhuman instrument, the thumbikins, was given to him in a present, by the council. It is said that king William expressed a desire to see it, and actually tried it on, bidding the doctor turn the screw; but at the third turn, he cried out, 'Hold, hold, doctor! another turn would make me confess anything!' This excellent person died in 1715; and in 1754 his State Papers and Letters, with an Account of his Life, were published in 1 vol., 4to, by Dr. M'Cormick.

CART, *v.* & *n.* CA'RTAGE, *n.* CA'RTER, *n.* CA'RTERLY, *n.* CA'RTFUL, *n.* CA'RT-HORSE, *n.* CA'RT-JADE, *n.* CA'RT-LOAD, *n.* CA'RT-ROPE, *n.* CA'RT-RUT, *n.* CA'RT-WAY, *n.* CA'RT-WHEEL, *n.* CA'RT-WRIGHT, *n.*	Ang.-Sax. *cræt*, *craf*; Welsh, *cart*; Fr. *charette*; Lat. *carrus*. In its most extensive signification, cart is a carriage in general, and formerly cart and carter were used for chariot and charioteer. Cart is now almost uniformly applied to a two-wheeled carriage, for the conveyance of goods, the driver of which is a carman. To

cart is to load a cart, and to expose in such a vehicle, as a punishment. The fatal cart is the vehicle in which criminals are conveyed to execution. Cartage is the employment, or hire, of of a cart; and carterly is rude, like a carter. The meaning of the compounds is sufficiently obvious.

And right at entring of the townes end,
To which this Sompnour shope him for to wende,
They saw a *cart*, that charged was with hay,
Which that a *carter* drove forth on his way;
Depe was the way; for which the *carte* stood;
The *carter* smote and cried as he were wood
Heit scot, heit brok, what space for the stones?
Chaucer. Cant. Tales.

Alas! what weights are these that load my heart!
I am as dull as winter-starved sheep,
Tired as a jade in overloaded *cart*. *Sidney.*

Full thirty times has Phœbus' *cart* gone round
Neptune's salt wash, and Tellus' orbed ground;
And thirty dozen moons, with borrowed sheen,
About the world have times twelve thirties been;
Since love our hearts, and Hymen did our hands
Unite commutual in most sacred bands. *Shakspeare.*

Let me be no assistant for a state,
But keep a farm and *carters*. *Id.*

It was determined that these sick and wounded soldiers should be carried on the *cart-horses*. *Knolles.*

Democritus ne'er laughed so loud
To see bawds *carted* through the crowd. *Hudibras.*

Now while my friend, just ready to depart,
Was packing all his goods in one poor *cart*,
He stopped a little. *Dryden.*

Carter and host confronted face to face. *Id.*

The squire, whose good grace was to open the scene,
Now fitted the altar, now traversed the *cart*,
And often took leave, but was loath to depart. *Prior.*

She chuckled when a bawd was *carted*;
And thought the nation ne'er would thrive,
Till all the whores were burnt alive. *Id.*

Let Wood and his accomplices travel about a country with *cart* loads of their ware, and see who will take it. *Swift.*

Oh happy streets! to rumbling wheels unknown,
No *carts*, no coaches, shake the floating town! *Gay.*

Oxen are not so good for draught, where you have occasion to *cart* much, but for winter ploughing. *Mortimer.*

CART. In London and Westminster, carts shall not carry more than twelve sacks of meal, 750 bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses. Carmen are forbidden to ride either on their carts or horses. They are to lead or drive them on foot through the streets, on the forfeiture of ten shillings. Stat. 1 Geo. I., cap. 57.

CARTE (Thomas), the historian, was the son of Mr. Samuel Carte, prebendary of Litchfield, and born in 1686. He was reader in the abbey-church at Bath; and, on the accession of the house of Hanover, he refused to take the oaths and put on a lay habit. He is said to have acted as secretary to bishop Atterbury before his troubles; and in 1722, being accused of high treason, a reward of £1000 was offered for apprehending him: but queen Caroline, the patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Thuanus, in 7 vols. folio. 2. The Life of the first Duke of Ormond, 3 vols. folio. 3. The History of England, 4 vols. folio. 4. A Collection of Original Letters and Papers concerning the Affairs of England, 2 vols. 8vo; and some other works. He died in April, 1754. His History of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c He had a series of Memoirs, from the beginning to the end of Charles IId's reign. At his death, all his papers fell into the hands of his widow, and are now deposited in the Bodleian library, having been delivered by Mr. Jernegan, her second husband, to the university, 1778, for a valuable consideration. Whilst they were in this gentleman's possession, the earl of Hardwicke paid £200 for the perusal of them. For a consideration of £300, Mr Macpherson had the use of them; and from these and otner materials compiled his History and State Papers. It is not generally known that this ingenious individual was the original founder of the City Library connected with the corporation of London. Mr. Carte's first prospectus was published in 1743

CARTE BLANCHE, Fr. A blank paper; a paper to be filled up with such conditions as the person to whom it is sent thinks proper.

CARTEL, *n. s.* Fr. *cartel*; Ital. *cartello*. A writing containing, for the most part, stipulations between enemies; anciently any public paper.

They flatly disavouch
To yield him more obedience, or support;
And as to perjured duke of Lancaster,
Their *cartel* of defiance, they prefer.
Daniel's Civil War.

As this discord among the sisterhood is likely to engage them in a long and lingering war, it is the more necessary that there should be a *cartel* settled among them. *Addison's Freeholder.*

CARTEL SHIP, a ship commissioned in time of war to exchange the prisoners of two hostile powers; also to carry any proposal from the one to the other. The officer who commands her must carry no cargo, ammunition, or implements of war, except a single gun for signals.

CARTERET, a maritime county of North

To contain; to comprise.

He thought it *carried* something of an argument in it, to prove that doctrine. *Watts on the Mind.*

To have annexed; to have anything joined: with the particle *with.*

There was a righteous and a searching law, directly forbidding such practices; and they knew that it *carried with* it the divine stamp. *South.*

The obvious portions of extension that affect our senses, *carry with* them into the mind the idea of finite. *Locke.*

To convey or bear anything united or adhering, by communication of motion.

We see also manifestly, that sounds are *carried* with wind: and therefore sounds will be heard further with the wind than against the wind. *Bacon's Natural History.*

To move or continue anything in a certain direction

His chimney is *carried* up through the whole rock, so that you see the sky through it, notwithstanding the rooms lie very deep. *Addison on Italy.*

To push on ideas, arguments, or anything successive in a train.

To convey by means of something supporting.

Carry camomile, or wild thyme, or the green strawberry, upon sticks, as you do hops upon poles. *Bacon's Nat. Hist.*

To bear, as trees.

Set them a reasonable depth, and they will *carry* more shoots upon the stem. *Bacon's Nat. Hist.*

To fetch and bring, as dogs.

Young whelps learn easily to *carry*; young popinjays learn quickly to speak. *Ascham's Schoolmaster.*

To carry off. To kill.

Old Parr lived to one hundred and fifty-three years of age, and might have gone further if the change of air had not *carried* him *off.* *Temple.*

To carry on. To promote; to help forward.

It *carries on* the same design that is promoted by authors of a graver turn, and only does it in another manner. *Addison.*

To carry on. To continue; to put forward from one stage to another.

Æneas's settlement in Italy was *carried on* through all the oppositions in his way to it, both by sea and land. *Addison.*

To carry on. To prosecute; not to let cease.

France will not consent to furnish us with money sufficient to *carry on* the war. *Temple.*

To carry through. To support; to keep from falling, or being conquered.

That grace will *carry* us if we do not wilfully betray our succours, victoriously *through* all difficulties. *Hammond.*

To Carry, *v. n.* A hare is said by hunters to carry, when she runs on rotten ground, or on frost, and it sticks to her feet.

2. A horse is said to carry well, when his neck is arched, and he holds his head high; but when his neck is short, and ill shaped, and he lowers his head, he is said to carry low.

Carrying Wind, a term applied by dealers in horses to one that frequently tosses his nose as high as his ears, and does not carry handsomely. The difference between carrying in the wind, and beating upon the hand, is this: that the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low; and even between these two there is a difference in wind.

CARSTAIRS (William), an eminent Scotch divine, was the son of a clergyman, and born at a village near Glasgow in 1649. He studied theology; and the persecutions and oppressions of government, both in regard to civil and religious liberty, having excited his strongest indignation, he went to Utrecht. During his residence abroad, he became acquainted with pensionary Fagel, and entered with warmth into the interest of the prince of Orange. On his return to Scotland to procure a license, he became disgusted with the insolent conduct of archbishop Sharp, and went back to Holland. His prudence, his reserve, and his political address, were strong recommendations to the prince of Orange; who employed him in personal negociations in Holland, England, and Scotland. Upon the elevation of his master to the British throne, he was appointed the king's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should be established there. Carstairs, more versant in the affairs of his native country, saw all the impropriety of this project, and the danger that would arise from enforcing it. His reasonings, his remonstrances, his intreaties, overcame the firmness of king William. He yielded to considerations founded alike in policy and in prudence; and to Carstairs Scotland is indebted for the full establishment of its church in the Presbyterian form of government. The death of king William was a severe affliction to him; and it happened before that prince had provided for him with the liberality he deserved. He was continued, however, in his office by queen Anne; and was appointed principal to the University of Edinburgh. He was one of the ministers of the city, and four times moderator of the general assembly. His influence and activity were also exerted with success in promoting the arts and sciences. The universities of Scotland owe him the highest obligations. He procured for them an augmentation of the salaries of their professors; a circumstance to which may be ascribed their reputation, as it enabled them to cultivate with spirit the different branches of knowledge. His religion had no mixture of austerity; his secular transactions were attended with no imputation of artifice; and the versatility of his talents made him pass with ease from a court to a college. He was among the last who suffered torture before the privy council, to make him divulge the secrets entrusted to him, which he firmly resisted; and after the revolution, that

CA'RTER, *n.*
CA'RTERLY, *n.*
CA'RTFUL, *n.*
CA'RT-HORSE, *n.*
CA'RT-JADE, *n.*
CA'RT-LOAD, *n.*
CA'RT-ROPE, *n.*
CA'RT-RUT, *n.*
CA'RT-WAY, *n.*
CA'RT-WHEEL, *n.*
CA'RT-WRIGHT, *n.*

Ang.-Sax. *cræt*, *cræt*; Welsh, *cart*; Fr. *charette*; Lat. *carrus*. In its most extensive signification, cart is a carriage in general, and formerly cart and carter were used for chariot and charioteer. Cart is now almost uniformly applied to a two-wheeled carriage, for the conveyance of goods, the driver of which is a carman. To cart is to load a cart, and to expose in such a vehicle, as a punishment. The fatal cart is the vehicle in which criminals are conveyed to execution. Cartage is the employment, or hire, of of a cart; and carterly is rude, like a carter. The meaning of the compounds is sufficiently obvious.

And right at entring of the townes end,
To which this Sompnour shope him for to wende,
They saw a *cart*, that charged was with hay,
Which that a *carter* drove forth on his way;
Depe was the way; for which the *carte* stood;
The *carter* smote and cried as he were wood
Heit scot, heit brok, what space for the stones?
Chaucer. Cant. Tales.

Alas! what weights are these that load my heart!
I am as dull as winter-starved sheep,
Tired as a jade in overloaded *cart*. *Sidney.*

Full thirty times has Phœbus' *cart* gone round
Neptune's salt wash, and Tellus' orbed ground;
And thirty dozen moons, with borrowed sheen,
About the world have times twelve thirties been;
Since love our hearts, and Hymen did our hands
Unite commutual in most sacred bands. *Shakspeare.*

Let me be no assistant for a state,
But keep a farm and *carters*. *Id.*

It was determined that these sick and wounded soldiers should be carried on the *cart-horses*. *Knolles.*

Democritus ne'er laughed so loud
To see bawds *carted* through the crowd. *Hudibras.*

Now while my friend, just ready to depart,
Was packing all his goods in one poor *cart*,
He stopped a little. *Dryden.*

Carter and host confronted face to face. *Id.*

The squire, whose good grace was to open the scene,
Now fitted the altar, now traversed the *cart*,
And often took leave, but was loath to depart. *Prior.*

She chuckled when a bawd was *carted*;
And thought the nation ne'er would thrive,
Till all the whores were burnt alive. *Id.*

Let Wood and his accomplices travel about a country with *cart* loads of their ware, and see who will take it. *Swift.*

Oh happy streets! to rumbling wheels unknown,
No *carts*, no coaches, shake the floating town! *Gay.*

Oxen are not so good for draught, where you have occasion to *cart* much, but for winter ploughing. *Mortimer.*

CART. In London and Westminster, carts shall not carry more than twelve sacks of meal, 750 bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses. Carmen are forbidden to ride either on their carts or horses. They are to lead or drive them on foot through the streets, on the forfeiture of ten shillings. Stat. 1 Geo. I., cap. 57.

CARTE (Thomas), the historian, was the son of Mr. Samuel Carte, prebendary of Litchfield, and born in 1686. He was reader in the abbey-church at Bath; and, on the accession of the house of Hanover, he refused to take the oaths and put on a lay habit. He is said to have acted as secretary to bishop Atterbury before his troubles; and in 1722, being accused of high treason, a reward of £1000 was offered for apprehending him: but queen Caroline, the patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Thuanus, in 7 vols. folio. 2. The Life of the first Duke of Ormond, 3 vols. folio. 3. The History of England, 4 vols. folio. 4. A Collection of Original Letters and Papers concerning the Affairs of England, 2 vols. 8vo; and some other works. He died in April, 1754. His History of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c He had a series of Memoirs, from the beginning to the end of Charles IId's reign. At his death, all his papers fell into the hands of his widow, and are now deposited in the Bodleian library, having been delivered by Mr. Jernegan, her second husband, to the university, 1778, for a valuable consideration. Whilst they were in this gentleman's possession, the earl of Hardwicke paid £200 for the perusal of them. For a consideration of £300, Mr Macpherson had the use of them; and from these and other materials compiled his History and State Papers. It is not generally known that this ingenious individual was the original founder of the City Library connected with the corporation of London. Mr. Carte's first prospectus was published in 1743

CARTE BLANCHE, Fr. A blank paper; a paper to be filled up with such conditions as the person to whom it is sent thinks proper.

CAR'TEL, *n. s.* Fr. *cartel*; Ital. *cartello*. A writing containing, for the most part, stipulations between enemies; anciently any public paper.

They flatly disavouch
To yield him more obedience, or support;
And as to perjured duke of Lancaster,
Their *cartel* of defiance, they prefer.
Daniel's Civil War.

As this discord among the sisterhood is likely to engage them in a long and lingering war, it is the more necessary that there should be a *cartel* settled among them. *Addison's Freeholder.*

CARTEL SHIP, a ship commissioned in time of war to exchange the prisoners of two hostile powers; also to carry any proposal from the one to the other. The officer who commands her must carry no cargo, ammunition, or implements of war, except a single gun for signals.

CARTERET, a maritime county of North

Carolina, in the district of Newbern, bounded on the south by Core Sound; north by Craven; east and north-east by Pamlico Sound and Neus River; and on the west by Onslow county. The chief town is Beaufort.

CARTES (Rene Des), one of the most eminent philosophers and mathematicians in the seventeenth century. He was descended of an ancient family in Touraine, in France, and born 31st of March 1596. At the Jesuits' college at La Fleche, he made a very great progress in the learned languages and polite literature, and became acquainted with Father Mersenne. He was originally designed for the army; but his constitution not permitting him to expose himself to its fatigues, he was sent to Paris, where he launched into gaming, and had prodigious success. Here Mersenne persuaded him to return to study; which he pursued till he went to Holland, in May 1616, when he engaged as a volunteer in the service of the prince of Orange. While he was in garrison at Breda, he wrote a Treatise on Music, and laid the foundation of several of his works. He was at the siege of Rochelle in 1628; returned to Paris; and a few days after his return, at an assembly of men of learning, in the house of Monsignor Bagni, the pope's nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from thence to Franeker, where he began his Metaphysical Meditations, and drew up his Discourse on Meteors. He made a short tour to England; and, in the neighbourhood of London, made some observations concerning the declination of the magnet. He returned to Holland, where he finished his Treatise on the World. His books made a great noise in France; and in Holland his system bid fair to discard the old philosophy. Voetius, being rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of it. In 1647 he returned to France, where the king settled a pension of 3000 livres upon him. Christiana, queen of Sweden, invited him into that kingdom, received him with the greatest civility, and engaged him to attend her every morning at five o'clock, to instruct her in philosophy. She also desired him to revise and digest all his unpublished writings, and to form a complete body of philosophy from them. She likewise proposed to allow him a revenue, and to form an academy, of which he was to be the director. But these designs were frustrated by his death in 1650. His body was interred at Stockholm, and seventeen years afterwards removed to Paris, where a magnificent monument was erected to him in the church of St. Genevieve du Mont. Dr. Halley, in a paper concerning optics, observes, that though some of the ancients mention refraction as an effect of transparent mediums, Des Cartes was the first who discovered the laws of refraction, and reduced dioptrics to a science. His philosophy, it is well known, has given way to the more accurate discoveries and demonstrations of the Newtonian system. See ASTRONOMY.

CARTHAGE, a celebrated city of antiquity, the capital of Africa Propria; and which for many years disputed with Rome the sovereignty of the world. According to Velleius Paterculus, this city was built sixty-five, according to Justin and Trogus twelve, according to others 100 or 140 years, before the foundations of Rome were laid. It is on all hands agreed that the Phœnicians were the founders. It was situated on a peninsula of the Mediterranean, thirty-six miles north-west of Tunis, and 352 east of Algiers; directly opposite to Rome.

At the third Punic war, Carthage appears to have been one of the first cities in the world. It was no less than 360 stadia, or forty-five miles in circumference, and was joined to the continent by an isthmus, twenty-three stadia or three miles and a furlong in breadth. On the west side projected a long tract of land half a stadium broad; which, shooting out into the sea, separated it from a lake or morass, and was strongly fortified on all sides by rocks and a single wall. In the middle of the city stood the citadel of Byrsa, having on the top of it a temple sacred to Æsculapius, seated upon rocks on a very high hill, to which the ascent was by sixty steps. On the south side the city was surrounded by a triple wall thirty cubits high; flanked all round by parapets and towers, at equal distances of 480 feet. Every tower had its foundation sunk thirty-two feet deep, and was four stories high, though the walls were but two: they were arched; and in the lower part, corresponding in depth with the foundations above mentioned, were stalls large enough to hold 300 elephants with their fodder, &c. Over these were stalls and other conveniences for 4000 horses; and there was likewise room for lodging 20,000 foot and 4000 cavalry, without incommoding the inhabitants. There were two harbours, which had one common entrance seventy feet broad, and shut up with chains. The first was appropriated to the merchants; and included in it a vast number of places of refreshment, and all kinds of accommodations for seamen. The second, as well as the island of Cothon, in the midst of it, was lined with large keys, in which were receptacles for sheltering 220 ships of war. Over these were magazines of all sorts of naval stores. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and island represented on each side two magnificent galleries. Near this island was a temple of Apollo, in which was a statue of the god, of massy gold; and the inside of the temple all lined with plates of the same metal, weighing 1000 talents. The city was twenty-three miles in circumference, and contained 700,000 inhabitants. Of their power we may have some idea, by the quantity of arms they delivered up to the Roman consuls. The whole army was astonished with the long train of carts loaded with them, which were thought sufficient to have armed all Africa. On this occasion there were put into the hands of the Romans 2000 catapultæ, 200,000 complete suits of armour, with an innumerable quantity of swords, darts, javelins, arrows, and beams armed with iron, which were thrown from the ramparts by the balistæ.

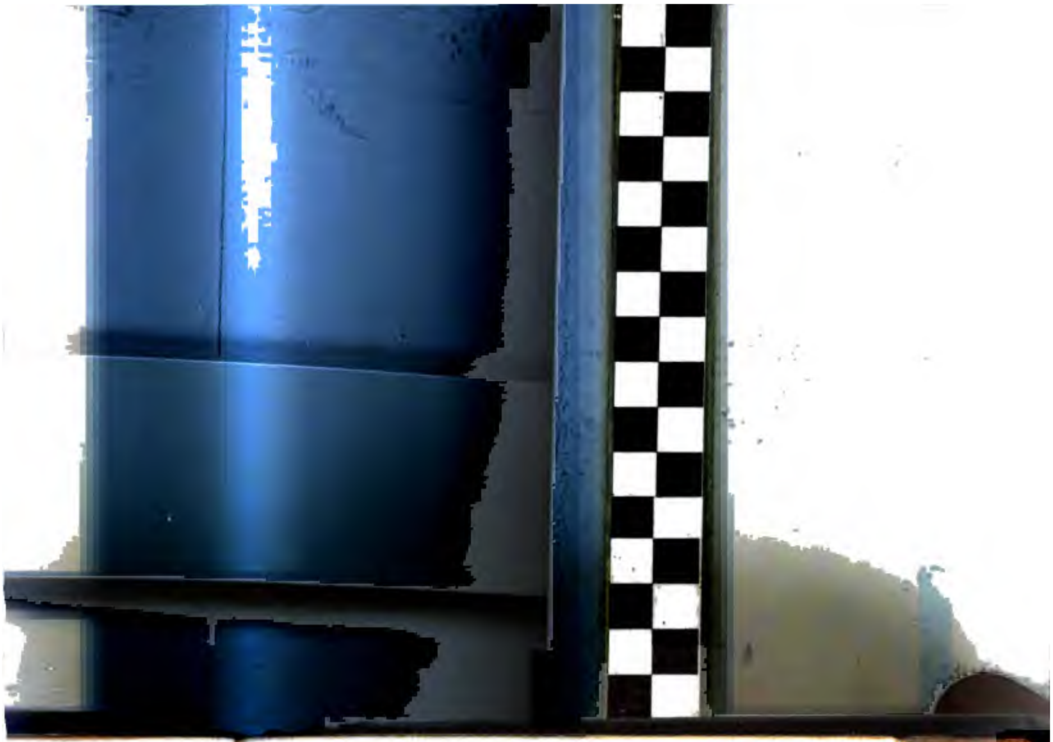
The beginning of the Carthaginian history, like that of most other nations, is obscure and uncertain. In the seventh year of Pygmalion, king of Tyre, his sister Elisa, or Dido, is said to have fled, with some of her companions and vassals, from the cruelty and avarice of her brother Sichæus. She first touched at the island of Cyprus, where she met with a priest of Jupiter, who was desirous of attending her, to which she readily consented, and fixed the priesthood in his family. At that time it was a custom in the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea side, to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these the Tyrians selected eighty, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa, and at last safely landed in the province called Africa Propria, not far from Utica. The inhabitants received their countrymen with great joy, and invited them to settle among them. The common fable is, that the Phœnicians imposed upon the Africans in the following manner:—They desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at; but were surprised, when, upon their granting it, they saw Elisa cut the hide into the smallest shreds, by which means it surrounded a large territory; in which she built the citadel called Byrsa. The learned, however, are now unanimous in exploding this fable; and it is certain that the Carthaginians for many years paid an annual tribute to the Africans for the ground they possessed. The new city soon became populous and flourishing, by the accession of the neighbouring Africans, who came thither at first with a view to traffic. In a short time it became so considerable, that Iarbas, a neighbouring prince, thought of making himself master of it without any effusion of blood. In order to this, he desired that an embassy of ten of the most noble Carthaginians might be sent him; and, upon their arrival, proposed to them a marriage with Dido, threatening war in case of a refusal. The ambassadors, being afraid to deliver this message, told the queen that Iarbas desired some person might be sent him who was capable of civilising his Africans; but that there was no possibility of finding any of her subjects, who would leave his relations for the conversion of such barbarians. For this they were reprimanded by the queen, who told them that they ought to be ashamed of refusing to live in any manner for the benefit of their country. They now informed her, therefore, of the true nature of their message from Iarbas; and that, according to her own decision, she ought to sacrifice herself for the good of her country. The unhappy queen, rather than submit to be the wife of such a barbarian, caused a funeral pile to be erected, and put an end to her life with a dagger. This is Justin's account of the death of queen Dido, and is the most probable; Virgil's story of her amour with Æneas being considered fabulous, even in the days of Macrobius. The Punic archives being destroyed by the Romans, there is now a chasm in the Carthaginian history for above 300 years. It appears, however, that, from the beginning, the Carthaginians applied themselves to maritime affairs, and were formidable by sea in the time of Cyrus and Cambyses. From Diodorus Siculus and Justin it also appears, that the principal support of the Carthaginians were the mines of Spain, in which country they seem to have established themselves very early. Justin insinuates, that the first Carthaginian settlement in Spain happened when the city of Gades, now Cadiz, was in its infancy.

About the year before Christ 503 the Carthaginians entered into a treaty with the Romans. It related chiefly to matters of navigation and commerce. From it we learn that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with the coasts of Italy; and that, even at this early period, a spirit of jealousy had arisen between the two republics. About this period the Carthaginians wished to discontinue the tribute they had hitherto paid the Africans, for the ground on which their city stood. But, notwithstanding all their power, they were obliged to conclude a peace, one of tha articles of which was, that the tribute should be continued. By degrees they extended their power over all the islands in the Mediterranean, Sicily excepted; and for the conquest of this they made preparations, about A.A.C. 480. Their army consisted of 300,000 men; their fleet of upwards of 2000 men of war, and 3000 transports. Hamilcar, their general, having landed their numerous forces, attacked Himera, a city of considerable importance, but was at last assaulted in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of their greatest overthrows: 150,000 were killed in the battle and pursuit, we are told, and all the rest taken prisoners; and of their 2000 ships of war and 3000 transports, eight ships only, which then happened to be out at sea, escaped. These sailed for Carthage, but were cast away, and every soul perished, except a few who were saved in a boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the city upon receiving the news of this disaster. Ambassadors were despatched to Sicily, with orders to conclude a peace upon any terms. They are said to have prostrated themselves before Gelon, and with tears to have entreated him to receive their city into favor. He granted their request, upon condition that Carthage should pay him 2000 talents of silver, that they should build two temples, where the articles of the treaty should be deposited, and that for the future they should abstain from human sacrifices. The Carthaginians complimented his wife Demarata with a crown of gold worth a 100 talents. From this time little mention is made of the Carthaginians for seventy years. They, however, gradually extended their dominions in Africa, shook off the tribute which gave them so much uneasiness, and went to war with the Cyrenians in this interval. At last two brothers, called Philæni, were sent out for Carthage, who, partly by their superior celerity and still more by their uncommon patriotism, gained a large extent of territory to Carthage. See PHILÆNI. About A. A. C. 412, Hannibal was appointed to assist the Egestines, a Sicilian people, against the Selinuntines, and having landed his forces he immediately marched for Selinus. In his way he took Emporium. Selinus made a vigorous defence, but at last the city was taken by storm; about 16,000 of the inhabitants being massacred: the temples were plundered, and the city rased to the ground. Hannibal next laid siege to Himera, wishing to revenge the death of his grandfather Hamilcar, who had been slain here by Gelon. Finding his battering engines not to answer his purpose, he undermined the wall with large beams of timber, to which he set fire, and thus laid it flat on the ground. At last he became master of the place, and treated it as he had done Selinus. The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But age and infirmities advanced upon Hannibal; all Sicily was alarmed; and the principal cities were put into the best state of defence. The Carthaginians first marched to Agrigentum, and began to batter the walls with great fury, but were defeated by a reinforcement of other Syracusans, and forced to retreat under the walls of Agrigentum with the loss of 6000 men. They finally, however, took the place, and immense booty was found in it. Their next attempt was upon Gela, to the assistance of which Dionysius came, with an army of 50,000 foot, and 1000 horse. With these he attacked the Carthaginian camp, but was repulsed with loss, and sent a trumpet to Imilcar to desire a cessation of arms, in order, as was pretended, to bury the dead, but in reality to give the people of Gela an opportunity to escape. Most of the citizens left the place in the night, and Dionysius, with the army, followed them. The Carthaginians finding the city deserted by most of its inhabitants, immediately entered it, putting to death all who remained; after which, Imilcar, having plundered it, moved towards Camarina: but the inhabitants of this city had likewise been drawn off by Dionysius, and it underwent the same fate with Gela. Imilcar now finding his army weakened by these exertions, and by a plague which broke out in it, sent a herald to Syracuse to offer terms of peace. The Carthaginians, besides their ancient acquisitions in Sicily, were, according to this proposal, to possess the countries of the Silicani, the Selinuntines, the Himereans, and Agrigentines; the people of Gela and Camarina to be permitted to reside in their respective cities, upon paying an annual tribute to the Carthaginians; and the other Sicilians to preserve their independence. The Syracusans were to remain under Dionysius. That tyrant concluded this peace only to gain time, and to put himself in a condition to attack the Carthaginian territories with greater force. Immediately afterwards he gave up to the fury of the populace the persons and possessions of the Carthaginians who resided in Syracuse. Their ships, which were then in the harbour, laded with cargoes of great value, were plundered, and their houses ransacked. This example was followed throughout the whole island. He ultimately advanced with his army on Mount Eryx, near which stood Motya, a Carthaginian colony, which he invested. But soon after, leaving his brother Leptines to carry on the siege, he proceeded to reduce the cities in alliance with the Carthaginians. The Carthaginians, in the meantime, sent officers to Europe, with considerable sums, to raise troops. Ten galleys were also sent from Carthage to destroy all the ships that were found in the harbour of Syracuse. The admiral entered the harbour by night, without being perceived by the enemy; and having sunk most of the ships he found there, returned without the loss of a man. All this while the Motyans defended themselves with great vigor. At last the place was taken by storm, and the Greek soldiers began a general massacre. Next year, notwithstanding a considerable loss sustained in a sea-fight with Leptines, Himilco, the Carthaginian general, landed a powerful army at Panormus, seized upon Eryx, and then advancing towards Motya, made himself master of it, before Dionysius could send any forces to its relief. He next advanced to Messina, which he besieged and took; after which most of the Siculi revolted from Dionysius. Notwithstanding this defection, Dionysius, finding his forces still amount to 30,000 foot and 3000 horse, advanced against the enemy, and, after several fluctuations of defeat and success, attacked the African general unexpectedly, ruined his fleet, and made himself master of his camp. Himilco finding himself unable to sustain another attack, came to a private agreement with Dionysius; who, for 300 talents, consented to let him escape to Africa, with the shattered remains of his fleet and army. Arrived at Carthage, Himilco was unable to bear his misfortunes, and put an end to his own life. Notwithstanding these disasters, the Carthaginians made new attempts upon Sicily, from A. A. C. 392 to 367, when the Syracusans being divided by civil dissentions, the Carthaginians thought it a proper time to exert all their efforts, in order to become masters of the island. They fitted out a fleet, and entered into alliance with Icetas, tyrant of Leontini, who pretended to have taken Syracuse under his protection. By this treaty the two powers engaged to assist each other, in order to expel Dionysius II. after which they were to divide the island between them. The Syracusans applied for succours to the Corinthians; and they readily sent them a body of troops, under the command of Timoleon. We cannot here detail his operations. See TIMOLEON. The Carthaginians at last concluded a peace on the following terms: that all the Greek cities should be set free; that the river Halycus should be the boundary between the territories of both parties; that the natives of the cities subject to the Carthaginians should be allowed to withdraw, if they pleased, to Syracuse, or its dependencies, with their families and effects; and lastly, that Carthage should not, for the future, give any assistance to the remaining tyrants against Syracuse. About A. A. C. 316 the Carthaginians engaged in another bloody war with the Sicilians, the particulars of which the reader will find narrated under the article SYRACUSE. It is only necessary here to mention, that the Carthaginians, although at first very successful in their war with Agathocles, tyrant of Syracuse, were soon after, by a singular and bold manœuvre, attacked in their own territories, their generals, Hanno and Bomilcar, defeated with great loss, and their capital itself besieged, by that prince, at the very time his own capital, Syracuse, was besieged by their general Hamilcar: who was at last obliged to raise the siege, and was defeated and beheaded by the Syracusans. These defeats led the superstitious Carthaginians to suppose they had fallen under the displeasure of their gods, by neglecting (according to their horrid system of priestcraft), to sacrifice children of noble families to them. They therefore sacrificed 200 children of the first rank, besides 300 other persons, who voluntarily offered themselves, to appease the wrath of their bloody deities! Agathocles, however, continued successful for a considerable time, till at last the tide turned in favor of the Carthaginians; whose generals, Hanno and Himilco, gained two great victories, and finally declared a peace on these terms: 1. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents. 2. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay. And 3. That the rest should be transported to Sicily, and have the city of Selinus for their habitation. During this war, the Agrigentines finding the Carthaginians and Syracusans had mutually weakened each other, took the opportunity of recovering many places out of the hands of both parties. See AGRIGENTUM. From the peace with Syracuse, to the first war with the Romans, we find nothing remarkable in the history of Carthage.

The first Punic war, as it is commonly called, happened about A. A. C. 256. At that time, the Carthaginians were possessed of extensive dominions in Africa; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics was the interference of the Romans with the affairs of Sicily. The Mamertines being vanquished in battle, and reduced to great straits by Hiero, king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, but Hannibal obtained possession of it by stratagem. Some were for accepting the permanent protection of Carthage; others for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly sent to Rome, and Caius Claudius was dispatched with a fleet to Rhegium. He crossed the straits, and had a conference with the Mamertines, in which he prevailed upon them all to accept of the protection of Rome: and made the necessary preparations for transporting his forces. But the Carthaginian admiral, coming up with them near the coast of Sicily, attacked them with great fury. During the engagement, a violent storm arose, which dashed many of the Roman vessels against the rocks, and greatly damaged their squadron; by which means Claudius was forced to retire to Rhegium, which he accomplished with difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them to expostulate with the Roman general upon the infraction of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture; Claudius soon after possessing himself of Messina. Such was the beginning of the first Punic war, which lasted twenty-four years. The particulars belong properly to the history of ROME, which see. Peace was at last concluded upon terms very unfavorable to the Carthaginians; who were bound by them, 1. To quit Sicily entirely, and all the Italian islands. 2. To pay the Romans 2200 talents of silver, or £437,250, at equal payments, within ten years, and 1000 talents immediately. 3. To restore the Roman captives and deserters without ransom; and to pay for their own. And, 4. Not to make war upon king Hiero or his allies. This bloody and expensive war had no sooner terminated, than the Carthaginians found themselves engaged in another, which had almost proved fatal to them. It is called by ancient historians the Libyan war, or the war with the mercenaries, as it arose out of the mutiny of those mercenary troops which the Carthaginians had hired during the war, and were not, at its close, able at once to pay. To complete their misery, they had no prospect of assistance from any foreign ally. They did not, however, despond, but adopted every prudent measure of defence. Hanno was appointed commander in chief, and the most strenuous efforts were made to reduce the rebels by force of arms. In the mean time Mathos, and Spendius, their leaders, laid siege to Utica and Hippacra; and cut off all communication betwixt Carthage and the continent of Africa. The capital was thus kept in a kind of blockade. Hanno was dispatched to the relief of Utica with a large body of forces, 100 elephants, and a train of battering engines. He immediately attacked their intrenchments, and after an obstinate dispute, forced them. The mercenaries lost a vast number of men; and the advantages gained by Hanno were so great, that they might have proved decisive, had he improved them: but becoming secure after his victory, the mercenaries rallied their forces, cut off many of his men, and plundered his camp, forcing the rest to fly into the town. He also suffered the mercenaries to take possession of the isthmus, on which Carthage stood, and which joined the peninsula to the continent of Africa. The Carthaginians, therefore, now placed Hamilcar Barcas at the head of their forces. He marched against the enemy with 10,000 men, horse and foot; being all the troops the Carthaginians could at this time assemble. Mathos, after he had possessed himself of the isthmus, passed the Bagrada by night, and advancing into the plain where his elephants were capable of acting, drew up his troops in order of battle; Spendius, then drew a body of 10,000 men out of Mathos's camp, which he posted on one side of Hamilcar, and ordered 15,000 from Utica to observe him on the other, thinking to surround the Carthaginians, and cut them all off at once. Hamilcar now feigning a retreat, engaged them at a disadvantage; and gave them a total overthrow with the loss of 6000 killed and 2000 taken prisoners. He pursued them to the town near the bridge, which he entered without opposition, the mercenaries flying in great confusion to Tunis. Upon this many towns submitted voluntarily to the Carthaginians, whilst others were reduced by force. Mathos, however, pushed on the siege of Hippo with vigor, and Spendius and Autaritus, commanders of the Gauls, at the head of a detachment of 6000 men, from the camp at Tunis, and 2000 Gallic horse, having received a strong reinforcement of Africans and Numidians, and seizing all the heights around the plain in which Hamilcar lay encamped, resolved to attack him. Had a battle now ensued, Hamilcar and his army must have been cut off; but a young Numidian nobleman deserted the mercenaries with 2000 men; a battle ensued just at this juncture, and the Africans were entirely overthrown, with the loss of 10,000 men killed, and 4000 taken prisoners. Mathos and his associates bearing of the lenity of Hamilcar towards his captives, and fearing it might occasion a defection among his troops, thought that the best expedient would be to put them upon some action so execrable in its nature, that no hopes of reconciliation might remain. Gisco and all the Carthaginian prisoners were therefore put to death. In revenge for this enormity, Hamilcar threw all the prisoners that fell into his hands to be devoured by wild beasts! After this the mercenaries were able to take the field with 50,000 men. But Hamilcar being much superior to them in tactics, shut them up at last in a post so situated, that he kept them strictly besieged; and the enemy not daring to venture a battle, began to fortify their camp, and surround it with ditches and intrenchments. They were soon so hard pressed by famine, that they were obliged to eat one another. At last, being reduced to the utmost extremity of misery, they insisted that Spendius, Autaritus, and Zarxas, their leaders, should have a personal conference with Hamilcar, and make proposals of peace. This was accordingly concluded upon the following terms, viz. That ten of the ringleaders should be left entirely to the mercy of the Carthaginians; and that the troops should all be disarmed, every man retiring only in a single coat. The treaty was no sooner concluded than Hamilcar, by virtue of the first article, seized upon the negociators themselves, and the army being informed that their chiefs were under arrest, had immediately recourse to arms, as suspecting they were betrayed; but Hamilcar, drawing out his forces in order of battle, surrounded them, and either cut them to pieces, or trod them to death with his elephants. The number of wretches who perished on this occasion amounted to above 40,000. Hamilcar now invested Tunis, and being joined in the command by Hannibal, the army was no sooner encamped, than he caused Spendius and the rest of the prisoners, to be let out in view of the besieged, and crucified near the walls. Mathos, however, sallied out, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cross, Mathos immediately substituted Hannibal in its room; and thirty Carthaginian prisoners of distinction were crucified around him. Upon this disaster, Hamilcar decamped, and posted himself along the sea-coast, near the mouth of the Bagrada. Thirty senators were now sent from Carthage, with Hanno at their head, to consult with Hamilcar about the proper measures for putting an end to this unnatural war; all the youth capable of bearing arms were at the same time pressed into the service; by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now drew Mathos into frequent ambuscades, and gave him a notable overthrow near Leptis. This reduced the rebels to the necessity of hazarding a decisive battle, which proved fatal to them. They fled almost at the first onset; Mathos, with a few, escaped to a neighbouring town, where he was taken, carried to Carthage, and executed; and then, by the reduction of the revolted cities, an end was put to this war, which, from the excesses of cruelty committed in it, according to Polybius, went among the Greeks by the name of the inexpiable war.

During the Lybian war, the Romans wrested the island of Sardinia from the Carthaginians; which the latter, not being able to resist, were obliged to submit to; Hamilcar finding his country not in a condition to enter into an immediate war with Rome. He now, however, projected the conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. Here he commanded nine years, during which he subdued many of the barbarous nations, and amassed an immense quantity of treasure. At last he was killed in a battle, and was succeeded by his son-in-law Asdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, now Carthagena. The Romans, who did not choose to come to an open rupture with him, on account of the apprehensions they were under of an invasion from the Gauls, concluded at this time the following treaty with Carthage:—1. That the Carthaginians should not pass the Iberus. 2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges. Asdrubal, after having governed the Carthaginian dominions in Spain for eight years, was treacherously murdered by a Gaul whose master he had put to death. Hannibal the younger was now saluted general by the army with demonstrations of joy. In the first campaign, he conquered the Olcades, a nation seated near the Iberus. Next year he subdued the Vaccæi, another nation in that neighbourhood. Soon after, the Carpætani, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they proposed to attack Hannibal on his return from the Vaccæi; but by stratagem they were utterly defeated, and the nation obliged to submit. Nothing now remained to oppose the progress of



the Carthaginian arms, but the city of Saguntum. Hannibal, for some time, did not think proper to come to a rupture with the Romans, by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Turdetani, with the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage, in case the general refused to give them satisfaction. They were scarce landed, when Hannibal, who was carrying on the siege of Saguntum with great vigor, sent them word that he had something else to do than to give audience to ambassadors. At last, however, he admitted them; and in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the senate of Carthage. On their arrival in that capital, they demanded that Hannibal might be delivered up to the Romans, to be punished according to his deserts; and this not being complied with, war was immediately declared between the two republics. The Saguntines defended themselves for eight months with incredible bravery; but at last, their city was taken, and the inhabitants were treated with the utmost cruelty. After this, Hannibal put his African troops into winter quarters at New Carthage; but in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

Having taken measures for securing Africa and Spain, he now passed the Iberus, subdued all the nations betwixt that river and the Pyrenees, appointed Hanno commander of all the newly conquered districts, and began his march for Italy. Upon mustering his forces, after they had been weakened by sieges, desertion, mortality, and a detachment of 10,000 foot and 1000 horse, left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. Hannibal easily crossed the Pyrenees; passed by Ruscino, a frontier town of the Gauls; and arrived on the banks of the Rhone without opposition. But in passing this river, he met with some opposition from the Gauls; and was for some time in doubt whether he should advance to engage the Romans, who, under Scipio, were marching that way, or continue his march for Italy. To the latter he was soon determined by the arrival of Magilus, prince of the Boii, who brought rich presents, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favorable to Hannibal's affairs, as there was no room to doubt the sincerity of this prince. It is not known with certainty where Hannibal began to ascend these celebrated barriers. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and taking possession of the eminences over which the Carthaginians must pass, continued harassing them, and disputing every foot of ground. At last, after a fatiguing march of nine days, he arrived at the summit of the pass. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. The sight of the snow covering the ground terrified them, it is said, extremely. Hannibal led them to the top of the highest rock on the side of Italy, and, showing them the fruitful plains of Insubria, told them that the Gauls, whose country they saw, were ready to join them. He also told them, that by climbing the Alps, they had scaled the walls of Rome. At last, after almost incredible fatigue and exertions, their way, which was exceedingly narrow, lay between two precipices; the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to attempt some other way: but every path around him being covered with snow, he found himself under the necessity of cutting a way through the rock itself. This was not accomplished without vast labor; and Hannibal, having spent nine days in ascending, and six in descending, the Alps, at last reached Insubria. Upon reviewing his army, he found, that of the 50,000 foot with whom he set out from New Carthage five months and fifteen days before, he had now only 20,000, and that his 9000 horse were reduced to 6000. He did not languish in idleness; but, joining the Insubrians, who were at war with the Taurinians, laid siege to Taurinum, the only city in that country, and in three days became master of it, putting all who resisted to the sword. The neighbouring tribes voluntarily submitted to the conqueror, and supplied his army with all sorts of provisions.—Having thus brought our Carthaginian hero to the borders of the Roman territories, we refer the reader for an account of his repeated and astonishing victories, as well as his ultimate defeats, during the second Punic war (which was chiefly carried on in Italy), to the History of Rome: and shall hasten to relate the accumulated distresses and final catastrophe of his country, which that hero exerted himself so much to prevent. After a tedious and expensive war of fourteen years, the Carthaginians were obliged to submit to the following very humiliating terms of peace, viz. 1. To deliver up all the Roman deserters, fugitive slaves, prisoners, and all the Italians whom Hannibal had obliged to follow him: 2. To give up all their ships of war except ten triremes, with all their tame elephants, and to train up no more of these animals for war: 3. Not to engage in any war without the consent of the Romans: 4. To pay to the Romans, in fifty years, 10,000 Euboic talents, at equal payments: 5. To restore to Masinissa all that they had usurped from him or his ancestors, and to enter into an alliance with him: 6. To assist the Romans both by sea and land, when called upon: and 7. Never to make any levies either in Ga or Liguria. These terms appeared so intolerable to the people of Carthage, that they threatened to burn the houses of the nobility; but Hannibal having assembled 600 foot and 500 horse at Marthama, prevented an insurrection, and by his influence completed the accommodation. These terms of peace, however, were scarcely signed when Masinissa seized part of the Carthaginian dominions in Africa, pretending that they formerly belonged to his family. The Carthaginians, through the mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. Hannibal was now intrusted with the command of an army against some neighbouring nations in Africa; but this being disagreeable to the Romans, he was removed from it, and raised to the dignity of a prætor of Carthage. But the Romans compelled his ungrateful country, at last, to expel him from this post, and he was obliged to fly to Antiochus king of Syria; his effects were confiscated, his house rased, and a public decree declared him an exile. Carthage now became, as she deserved to be, miserably dependent on Rome. Disputes arising with Masinissa, he made an irruption into the province of Tysca, where he seized fifty, or as some say, seventy towns and castles. This obliged the Carthaginians to apply with importunity to the Roman senate for redress: but Masinissa was left at liberty to pursue his plans. The Romans, however, affected to show a great regard to the principles of justice and honor, and sent Cato into Africa, to accommodate all differences. The Carthaginians now appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. But to prevent a rupture as much as possible, by a decree of the senate, they impeached Asdrubal, general of the army, and Carthalo, commander of the auxiliary forces, with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. About this time, the city of Utica, being the second in Africa, and famous for its riches, as well as its equally commodious and capacious port, submitted to the Romans; the latter, notwithstanding the most humble conduct on the part of this once great republic, declared war immediately against the Carthaginians. The consuls, M. Manlius Nepos, and L. Marcius Censorinus, were despatched with an army and fleet to commence hostilities. The land forces consisted of 80,000 foot and 4000 chosen horse; and the fleet of fifty quinqueremes, besides a vast number of transports. The consuls had secret orders from the senate, not to conclude their operations but by the destruction of Carthage. That devoted city was now ordered to send 300 young noblemen of the first distinction to the prætor Fabius at Lilybæum, within the space of thirty days, and comply with all the orders of the consuls. These hard terms filled the whole city with grief, but the hostages were delivered; and they arrived at Lilybæum before the thirty days were expired. The consuls only told them, that upon their arrival at Utica, they should learn the farther orders of the republic. Here they first demanded a sufficient supply of corn for the subsistence of their troops. 2. That they should deliver up into their hands all the triremes they were then masters of. 3. That they should put them in possession of all their military machines. And 4, that they should immediately convey all their arms into the Roman camp. As care was taken that there should be a convenient interval of time betwixt every one of these demands, the Carthaginians found themselves ensnared, and could not reject any one of them, though they submitted to the last with the utmost reluctance. Censorinus, now imagining them incapable of sustaining a siege, commanded them to abandon their city, or as Zonaras says, to demolish it; permitting them to build another, eighty stadia fom the sea, but without walls or fortifications. After their first feelings of surprise and indignation had subsided, the senators of Carthage now assembled and resolved to sustain a siege. They were stripped of their arms and destitute of provisions; but despair raised their courage, and suggested numerous expedients. They gathered on the ramparts heaps of stones, to serve them instead of arms in case of a surprise; and gave the slaves and common prisoners their liberty, and incorporated them in the militia. Asdrubal was recalled, and invited to employ the 20,000 men he had raised against his country, in defence of it. Another Asdrubal was appointed to command in Carthage; and all seemed resolute to save the city, or perish in its ruins. Every day they are said to have manufactured 144 bucklers, 300 swords, 1000 darts, and 500 lances and javelins. Where iron and brass were wanting, they made use of silver and gold, melting down the statues, vases, and the plate of private families. As tow and flax were wanting to make cords for working the machines, women of the first rank freely cut off their hair, and dedicated it to that use. Without the walls, Asdrubal employed troops in getting together provisions, and conveying them safe into Carthage; at length the Roman army sat down before the place and invested it. Persuaded that the Carthaginians had no arms, they flattered themselves that they should carry the city by assault. Accordingly, they approached to plant their scaling ladders; but, to their astonishment, discovered a prodigious multitude of men on the ramparts, in the armour they had newly made, and were obliged to resign their enterprise. In the mean time Asdrubal, having collected from all places subject to Carthage a prodigious number of troops, encamped within reach of the Romans, and reduced them to great straits for want of provisions. The troops of Marcius were attacked with a violent epidemic. He therefore ordered his fleet to draw as near the shore as possible, in order to transport them to a healthier spot. Asdrubal, being informed of this, ordered all the old barks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and taking advantage of the wind, which blew towards the enemy, let them drive upon the Roman ships, which were for the most part consumed. After this disaster, Marcius was recalled, and the Carthaginians made a brisk sally upon the remaining consul's camp, and would have succeeded, had not Æmilianus marched out of the opposite gate to where the attack was made, and falling unexpectedly on their rear, obliged them to return in disorder to the city. Asdrubal shortly after gave battle to the consul near Nepheris, and rushing down the hill, cut a great number of the Romans in pieces. The whole Roman army would now have been destroyed, had not Scipio Æmilianus, at the head of 300 horse, sustained the attack of Asdrubal's forces, and covered the legions, while they passed a river in their retreat. When the army had crossed, it was perceived that four manipuli were wanting; and, soon after, they were informed that they had retired to an eminence, where they expected to be cut off. Upon this Emilianus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized a hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested; and in spite of all opposition, opened a way for their escape. On his return to the army, his companions, who had despaired of his return, carried him to his quarters in triumph; and the manipuli he had saved gave him a crown of gramen. The next year the war in Africa fell by lot to the consul L. Calpurnius Piso; and he continued to employ Æmilianus in several important enterprises. He took several castles; and in one of his excursions, had a private conference with Phameas, general, under Asdrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse, to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea, but was obliged to abandon the enterprise. From this place he went to vent his rage on Neapolis, which professed a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place. Next year Scipio Æmilianus was chosen consul, and ordered to pass into Africa: upon his arrival the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These troops had seized Megalia, one of the suburbs of the city; but had not furnished themselves with provisions to subsist there, and could not retreat. Æmilianus obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having then drawn together all the troops, he applied himself wholly to the siege of the capital. He carried Megalia by assault, the Carthaginian garrison retiring into the citadel of Byrsa. Asdrubal was so enraged at this loss, that he caused all the Roman captives taken in the last two years to be brought upon the ramparts, and thrown headlong, in the sight of the Roman army, from the top of the wall. He was of a temper remarkably inhuman, and is said to have ordered several of these unhappy wretches to be flayed alive. Æmilianus, in the mean time, was busy in drawing lines of circumvallation and contravallation across the neck of land which joined Carthage to the continent of Africa. All the avenues on the land side were thus shut up, so that the city could receive no provisions that way. His next care was to raise a mole in the sea, to block up the old port, the new one being already shut up by the Roman fleet, and this great work he effected with immense labor. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port, being ninety feet broad at the bottom, and eighty at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than astonished, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Once more prompted by despair, however, the Carthaginians dug a new bason, and cut a passage into the sea, by which they could receive the provisions that were sent them by the troops in the field. With equal diligence and expedition, they fitted out a fleet of fifty triremes, which, to the great surprise of the Romans, appeared suddenly advancing into the sea through this new canal, and even ventured to give the enemy battle. The action lasted the whole day, with little advantage on either side. The day after, the consul endeavoured to make himself master of a terrace, which covered the city on the side next the sea; and on this occasion the besieged signalised themselves in a most remarkable manner. Great numbers of them, naked and unarmed, went into the water in the dead of the night, with unlighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire in the utmost confusion. This, however, did not discourage the consul: he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it pent in Carthage on the sea side, Æmilianus took care to fortify it against the sallies of the enemy; and winter now approaching, he suspended all further attacks on the place. He was, not, however, inactive. The Carthaginians had a very numerous army, strongly encamped near Nepheris, whence convoys of provisions were sent by sea to the besieged, and brought into the new bason. Emilianus therefore attacked the enemy's entrenchments here, put 70,000 to the sword, and made 10,000 prisoners; all the country people, who could not retire to Carthage, having taken refuge in this camp. After this he laid siege to Nepheris, which he reduced in twenty-two days. Early in the spring he renewed the siege of Carthage, and ordered Lælius to attempt the reduction of Cotho, a small island which divided the two ports. Æmilianus himself made a false attack on the citadel to facilitate this object; and when he understood by the loud shouts of the troops of Lælius, that he had made himself master of Cotho, he fell unexpectedly on the neighbouring gate of the city, which he broke down, and made a lodgment within it. The following day he ordered 4000 fresh troops to be sent from his camp, and, having solemnly devoted Carthage to the infernal gods, began to advance through the streets of the city to attack the citadel. The houses on both sides were very high, and filled with Carthaginians, who poured on the Romans darts and stones, so that they cou'd not proceed till they had cleared them. From the market place to the citadel, two bodies of men fought their way every step, one above on the roofs of the houses, the other below in the streets. The slaughter was immense. The air rung with lamentations. The pro-consul at last commanded fire to be set to that quarter of the town which lay next to the citadel; and multitudes, who had escaped the sword of the enemy, perished in the flames, or by the fall of the houses. After the fire, which lasted six days, had opened a large area where all his troops could act, Æmilianus appeared with his whole army before Byrsa, when 25,000 women, and 30,000 men, came out of the gates, and threw themselves prostrate before him, asking no favor but life. Asdrubal's wife earnestly entreated her husband to suffer her to join the suppliants, and carry with her to the proconsul her two sons, who were as yet very young; but he denied her request, and rejected her remonstrances with menaces. The Roman deserters, seeing themselves excluded from mercy, resolved to die sword in hand. To them Asdrubal committed the care of his wife and children; after which he, in a most cowardly manner, privately threw himself at the conqueror's feet. The Carthaginians in the citadel no sooner understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of Byrsa. They had now no enemy to contend with but the 900 deserters, who, being reduced to despair, retreated into the temple of Æsculapius, a second building within the first. There the proconsul attacked them; and these unhappy wretches, finding no way to escape, set fire to the temple. As the flames spread, they retreated from one part of the building to another, till they reached the roof. Here Asdrubal's wife appeared in her best apparel, uttering the most bitter imprecations against her husband, whom she saw standing below with Æmilianus. 'Base coward,' said she, 'the mean things thou hast done to save thy life shall not avail thee; thou shalt die this instant in thy two children.' Having thus spoken, she stabbed both the infants with a dagger; and while they were yet struggling for life, threw them from the top of the temple, and then leaped down after them into the flames. Æmilianus delivered up the city to be plundered, in the manner prescribed by the Roman military law. The soldiers were allowed to appropriate to themselves all the furniture, utensils, and brass money, they should find in private houses; but all the gold and silver, the statues, pictures, &c. were put into the hands of the quæstors. On this occasion the cities of Sicily, which had been often plundered by the Carthaginian armies, recovered a number of statues, pictures, and other valuable monuments; amongst the rest, the famous brazen bull, which Phalaris had ordered to be cast, and used as the chief instrument of his cruelty, was restored to the inhabitants of Agrigentum. As Æmilianus wished to spare what remained of this stately metropolis, he wrote to the senate on the subject, from whom he received the following orders: 1. To destroy entirely the city of Carthage, with Byrsa and Megalia, and to leave no traces of them. 2. To dismantle all the cities that had lent Carthage any assistance. 3 To enlarge the territories of those cities which had declared for the Romans, with lands taken from the enemy. 4. To divide all the lands between Hippo and Carthage among the inhabitants of Utica. 5. To subject all the Africans of the Carthaginian state, both men and women, to pay an annual tribute at so much per head. 6. To turn the whole country, formerly subject to the Carthaginian state, into a Roman province, to be governed by a prætor, like Sicily. Commissioners were also sent into Africa, to settle jointly with the pro-consul the state of the new province. Thus fell Carthage, about A. A. C. 146; a city whose destruction may be attributed more to the intrigues of an abandoned faction, than to the power of its rival. The treasure Æmilianus carried off was immense: Pliny making it amount to 4,470,000 pounds weight of silver.

The Romans ordered Carthage never to be inhabited again, denouncing dreadful imprecations against those who should attempt to rebuild any part of it, especially Byrsa and Megalia. About twenty-four years after, however, C. Gracchus, tribune of the people, undertook to rebuild it; and, to that end, conducted thither a colony of 6000 Roman citizens. The workmen, according to Plutarch, were terrified by many unlucky omens, while they were laying the foundations of the new city; which the senate being informed of, they would have suspended the attempt. But the tribune, little affected with such presages, continued to carry on the work, and finished it in a few days. Hence it is probable that only a kind of huts were erected; but whether Gracchus executed his design, or the work was entirely discontinued, it is certain that Carthage was the first Roman colony ever sent out of Italy. According to some, it was rebuilt by Julius Cæsar; and Strabo, who flourished in the reign of Tiberius, affirms it to have been equal, in his time, if not superior, to any other city in Africa. It was reckoned the capital of Africa for near 700 years after the Christian æra. Maxentius laid it in ashes about the sixth or seventh year of Constantine's reign. Genseric, king of the Vandals, took it A. D. 439; but about a century afterwards it was re-annexed to the Roman empire by the renowned Belisarius. At last the Saracens, under Mahomet's successors, towards the close of the seventh century, completely destroyed all its vestiges. On the ruins there now stands a small village, called Melcha. There are three eminences here, it is said, which are so many masses of fine marble pounded together, and are in all probability the remains of temples or other distinguished buildings. The present ruins are not the remains of the ancient city destroyed by the Romans; who after taking it entirely erased it; and ploughed up the very foundations; so strictly they adhered to the inhuman advice perpetually inculcated by Cato the elder, Delenda est Carthago. They are the ruins of the second city, which was destroyed by the Saracens.

CARTHAGENA, an ancient and well built town of Spain on the coast, and in the kingdom of

Murcia; capital of a territory of the same name. It was built by Asdrubal, the Carthaginian general, and named after Carthage. See CARTHAGE. It possesses the best harbour in Spain, but the former bishop's see is transferred to Toledo. Here is a manufacture of sail-cloth and extensive alum works. In the neighbourhood are found rubies, amethysts, and other precious stones; and about four miles to the east are the hot springs of Archena. Population 25,000. It was taken by Sir John Leake in 1706, and retaken by the duke of Berwick soon after. It is twenty-five miles S. S. E. of Murcia, and 115 S. S. W. of Valencia.

CARTHAGENA, a province of Colombia (formerly of the kingdom of New Granada), South America, in the department of Magdalena. It is bounded on the north by the Spanish main; on the south by the province of Antioquia; on the east by the great river Magdalena, and on the west by the river and province of Darien. It is eighty-five leagues long from north to south, and fifty-three wide from east to west. It is of a moist and warm temperature, full of mountains and woods, and towards the north part very swampy; but it is fertile in maize, rice, fruits, and cattle, in the hides of which it drives a great trade. Its mountains, among which that ridge of the Andes terminates which divides the bed of the Magdalena from the Darien, yield several fine dye-woods, gums, and balsams. The great plains or savannas of Zenu, Zamba, Tolu, Mempox and Barancas, are also very fruitful. The Magdalena and the Cauca are its most important rivers.

The European and native settlements are chiefly on the coast, or in the valley. Gold is said to have been abundant formerly in the hills and rivers, but has been little seen of late. Maize bread, called bollos, is used both by the natives and Europeans, but the negroes make use of the cassava bread, made from roots. Some opulent families use European flour. Sugar-cane plantations are common, the cotton-tree, and an excellent species of the cacao. The fruit of this province are melons, grapes, oranges, dates, the pine-apple, the plaintain, banana, papaws, yams, mameis, sapotes, limes, and tamarinds. The trees here grow to an immense bulk, and form a pleasing shade from the scorching sun. The canoes of the natives are formed of an excellent mahogany called acajou, and a beautiful white and red cedar is in common use. Here is also a poisonous fruit called the mançanillo, from the Spanish word mançana, an apple, the fruit of which resembles the European apple in shape, color, and taste; but the juice of this tree is so acrid, that it blisters the skin of those employed in felling it, and it is reckoned dangerous, we are told, to remain under its shade after a shower, as the droppings have the same quality. Numerous tribes of wild animals are found in the forests, among which the jaguar and the American leopard are the fiercest, and commit extensive depredations on the neighbouring plantations. Cattle and swine are numerous; and several rare and beautiful species of birds. The wild geese are caught by the Indians in a curious manner. In the places which they frequent, the Indians put calabashes or gourds, which, constantly floating on the surface of the water, cause no alarm to the geese, and when they are sufficiently accustomed to see them, the Indian gets into the water at a distance from the flock, with a gourd over his head; he then advances amongst them, and draws them by the legs under the surface, until he has procured as many as he wants.

The insects and reptiles are numerous. The centipede, the scorpion, and the spider, are all very troublesome; and amongst the serpents, the rattle-snake, the dart, and the dreadful corales, or coral snakes, are the most venomous. This province contains a population of 170,000 souls. It sends six representatives, and with Santa Marta and Rio Hacha, four senators to the congress of Columbia.

CARTHAGENA, a city of Columbia, South America, the capital of the above province, is situated in a peninsula, joined to some others, and to the continent by two artificial necks of land; the broadest of which is only seventy yards wide. The suburb Xexemani, in the island near the town, is nearly as large as the town itself, and is surrounded, as well as the city, with strong modern fortifications. At a small distance on the continent is a hill, 150 feet high, commanding both the fortifications and the strong fort of St. Lazaro. The bay of Carthagena is two leagues and a half from north to south, is completely land-locked, and has capital anchorage. Its chief disadvantage is the shoals near its entrance. It abounds with excellent turtle and other fish, but the numerous sharks render bathing unsafe.

The city is well planned, the houses generally of stone, the streets broad, straight, and well paved, and with lattices in the Spanish manner. The cathedral, churches, and monasteries, are the only public buildings worth notice. Carthagena is very subject to the leprosy; to prevent the increase of which, they have an hospital in which lepers are comfortably provided for, but confined for life.

The exports consist of cotton, sugar, Brazil and other woods, including that of indigo, cinchona, balm of Tolu, and ipecacuanha. The imports are European manufactures and other goods. Population about 25,000.

CARTHAMUS, in botany: a genus of the order of polygamia æqualis, syngenesia class of plants, natural order forty-ninth, compositæ: CAL. is ovate, imbricated with scales, close below, and augmented with subovate foliaceous appendices at top. Of this genus there are sixteen known specimens; but the only remarkable one is C. tinctorius, with a saffron colored flower, a native of Egypt, and some of the warm parts of Asia. It is cultivated in many parts of Europe, and in the the Levant, from whence great quantities of it are annually imported into Britain for dyeing and painting. The good quality of this commodity is in the color, which is of a bright saffron hue: and in this the British carthamus very often fails. The plants are propagated by seeds. The flowers should be taken off as they come to perfection: but this must be performed when they are perfectly dry; and then they should be placed in a kiln with a moderate fire, in the same manner as the true saffron. The seeds have been celebrated as a cathartic; but they operate very slowly, and for the most part disorder the stomach and bowels, especially when given in substance; triturated with distilled aromatic waters, they prove less offensive, yet inferior in efficacy to the common purgatives. A species of Egyptian parrot is very fond of them; to other birds or beasts they would prove a mortal poison.

CARTHUSIAN Powder. See Kermes.

Carthusians, a religious order founded A. D. 1080, by one Bruno; so called from the desert of Chartreuse, the place of their institution. Their rule is extremely severe. They must not go out of their cells, except to church, without leave of their superior; nor speak to any person without leave. They must not keep any meat or drink till next day; their beds are of straw, covered with a felt; their clothing two hair-cloths, two cowls, two pair of hose, and a cloke, all coarse. In the refectory, they must keep their eyes on the dish, their hands on the table, their attention on the reader, and their hearts fixed on God. Women must not come into their churches.

CAR'TILAGE, *n.*
Cartilagi'neous, *adj.*
Cartila'ginous, *adj.*
} Lat. *cartilago*. Cartilage, says Quincy, is a smooth and solid body, softer than a bone, but harder than a ligament. In it are no cavities or cells for containing of marrow; nor is it covered over with any membrane to make it sensible, as the bones are. The cartilages have a natural elasticity, by which, if they are forced from their natural figure or situation, they return to it of themselves, as soon as that force is taken away. The adjectives, of course, signify that which consists of cartilage. See the next article.

> Canals, by degrees, are abolished, and grow solid; several of them united grow a membrane; these membranes further consolidated become *cartilages*, and *cartilages* bones. *Arbuthnot.*

> By what artifice the *cartilagineous* kind of fishes poise themselves, ascend and descend at pleasure, and continue in what depth of water they list, is as yet unknown. *Ray.*

> The larynx gives passage to the breath, and as the breath passeth through the rimula, makes a vibration of those *cartilaginous* bodies, which forms that breath into a vocal sound or voice.
> *Holder's Elements of Speech.*

Cartilage, (cartilago, quasi caruilago; from caro, carnis, flesh). A white, elastic, glistening substance, growing to bones, and commonly called gristle. Cartilages are divided by anatomists into obducent, which cover the moveable articulations of bones; inter-articular, which are situated between the articulations, and which unite one bone with another. Their use is to lubricate the articulations of bones, and to connect some bones by an immoveable cohesion. See Anatomy.

Cartilaginous, in ichthyology, a title given to all fish whose muscles are supported by cartilages instead of bones. It comprehends the same genera to which Linnæus has given the name of amphibia nantes: Many of the cartilaginous fish are viviparous, being excluded from egg, which is hatched within them. The egg consists of a white and yolk; and is lodged in a case formed of a thick tough substance, not unlike softened horn: such are the eggs of the ray and shark kinds. Some are oviparous; such are the sturgeon, &c. They breathe either through certain apertures beneath, as in the ray; on their sides, as in the shark, &c.; or on the top of the head, as in the pipe-fish; for they have not covers to their gills, like the bony fish.

CARTMEL, a town of Lancashire, seated among the fells, near the river Kent. It has a handsome church, built in the form of a cross; and a market on Monday, well supplied with corn, sheep, and fish. It is eleven miles north by west of Lancaster, and 261 N. N. W. of London.

CARTO'ON, *n.* Fr. *carton;* Ital. *cartone;* Lat. *charta.* A painting or drawing on large paper. The celebrated series of drawings by Raphael is called *the* cartoons, by way of eminence, for the same reason that the most noble of musical instruments is named the organ.

> It is with a vulgar idea that the world beholds the *cartoons* of Raphael, and every one feels his share of pleasure and entertainment. *Watts.*

Cartoon, or Carton, is a design drawn on strong paper, to be afterwards calked through and transferred on the fresh plaster of a wall, to be painted in Fresco. It is also used for a design colored, for working in mosaic, tapestry, &c. The word is from the Italian cartone, (carta paper, and one large), denoting many sheets of paper pasted on canvas, on which large designs are made, whether colored or with chalks only. Of these many are to be seen at Rome, particularly by Domenichino. Those by Andrea Mantegna, which are at Hampton Court, were made for paintings in the old ducal palace at Mantua. But the most famous performances of this sort are the

Cartoons of Raphael, so deservedly applauded throughout Europe, with regard to the invention, and to the noble expression of such a variety of characters, countenances, and attitudes; they are seven in number, and form only a small part of the historical designs executed by this great artist, while engaged in the chambers of the Vatican, under popes Julius II. and Leo X. When finished, they were sent to Flanders, to be copied in tapestry, for adorning the pontifical apartments. On that city being plundered in the time of Clement VII. Raphael's scholars fled, and none were left to enquire after the original cartoons, which lay neglected in the store-rooms of the manufactory. The important revolutions also which followed in the Low Countries prevented their being noticed. It was therefore a fortunate circumstance that these seven escaped the wreck of the others, which were torn in pieces, and of which fragments are dispersed in different collections. These seven were purchased by Rubens for Charles I. and they have been so roughly handled from the first, that holes were pricked for the weavers to pounce the outlines, and other parts almost cut through in tracing. In this state they also fortunately escaped the sale amongst the royal collection, from the disproportioned appraisement of these seven at £300, and the nine pieces, being the triumph of Julius Cæsar, by Andrea Mantegna, at £1000. They seem to have been little taken notice of, till

seem to have been little taken notice of, till

king William built a gallery for them at Hampton Court; where they are now open to public inspection. Mr. Holloway has engraved some excellent plates of these cartoons.

CARTOUCH, in architecture and sculpture, an ornament representing a scroll of paper. It is usually a flat member, with wavings to represent some inscription, device, epithet, or ornament of armoury. They are, in architecture, much the same as modillions; only these are set under the cornice in wainscoting, and those under the cornice at the eaves of a house.

CARTOUCHE, in the military art, a case of wood about three inches thick at the bottom, girt with marlin, holding about 400 musket balls, besides six or eight balls of iron, of a pound weight, to be fired out of a howitzer, for the defence of a pass, &c.

CA'RTRAGE, or } Fr. *cartouche*; Ital. *car-*
CA'RTRIDGE, *n.* } *toccia.* A parchment, flannel, or paper case, filled with gunpowder for the service of artillery or musketry.

> Our monarch stands in person by,
> His new-cast cannons firmly to explore;
> The strength of big-corned powder loves to try,
> And ball and *cartrage* sorts for every bore.
>
> *Dryden.*

> Are you sure you do nothing to quit scores with him?—Nothing at all your honour, unless now and then we happen to fling a *cartridge* into the kitchen fire, or put a spatterdash or so into the soup; and sometimes little Ned drums up and down stairs a little in the night. *Sheridan.*

CARTRIDGE, a paper or case, holding the exact charge of a fire-arm. Those for muskets, carbines, and pistols, hold both the powder and ball for the charge; and those for cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the caliber of the piece.

CARTRIDGE BOX, a case of wood or turned iron, covered with leather, holding a dozen musket cartridges. It is worn upon a belt, and hangs a little lower than the right pocket-hole.

CA'RTULARY. Old Fr. *cartulaire*; Lat. *charta.* Johnson erroneously defines cartulary or chartulary, as a place where records are kept, whereas it signifies the record itself, and the title of an ecclesiastical officer to whose care the records are committed.

> Entering a memorial of them in the *chartulary* or leger-book of some adjacent monastery. *Blackstone.*

CARTWRIGHT (Christopher), an English divine, born at York, in 1602. He was very eminent for his knowledge in the Hebrew language; and wrote Electa Targumico-Rabbinica in Genesim, et in Exodum, published in 1643 and 1653, 8vo. He died in 1652.

CARTWRIGHT (Thomas), a celebrated divine of the puritan party, born in Herefordshire in 1555 He received his education at St. John's College, Cambridge, of which he became a fellow, but afterwards exchanged for a fellowship in Trinity. Having taken his degree of B. D. in 1567, he commenced preacher, and became very popular; but his opinions being somewhat presbyterian, he was complained of by archbishop Grindal, and was prevented from taking his doctor's degree, and obliged to give up his fellowship. He now went over to the continent, and was chosen minister to the English merchants at Antwerp, and afterwards at Middleburg; but returning to England, he used his utmost endeavour to overturn the ecclesiastical order, and establish the discipline of the Genevan church. Having written several pieces with that view, to which Dr. Whitgift replied, Cartwright was at length thrown into prison. By the favor of lord Burleigh and the earl of Leicester, however, he was released from his confinement, and the latter appointed him master of his hospital at Warwick, where he died in 1603. He wrote a Harmony of the Gospels in Latin, which was published at Amsterdam in 1647; also a Commentary on the Proverbs, and various other works. His Confutation of the Rhenish Testament did not come out till after his death.

CARTWRIGHT (William), an eminent divine and poet, born at Northway, near Tewkesbury, in Gloucestershire, in 1611. He finished his education at Oxford; afterwards went into orders, and became a preacher in the University. In 1642 he was successor in the church of Salisbury; and, in 1643, junior proctor and metaphysical reader in the University. He was an expert linguist, and an excellent orator. There are extant four of his plays, and some poems. He died in 1644, aged thirty-three.

CARTWRIGHT (John), an English gentleman, of eccentric political character, was the third son of William Cartwright, Esq. of Marnham, in the county of Nottingham, and born there in 1740. He was educated at Newark grammar-school, and afterwards entered into the navy, in which he rose to the rank of lieutenant; but objecting to the American war, he retired from the service. He now became major in the Nottinghamshire militia, a circumstance to which he owed the popular title of major, long after he ceased to hold the commission. In 1775 he published a tract entitled American Independence the Glory and Interest of Great Britain; and joined Dr. John Jebb in 1780, Granville Sharpe, &c. in forming the Society for Constitutional Information. He was roused by the French revolution to publish The Commonwealth in Danger, 1795, and was afterwards the author of numerous publications on a Reform in the House of Commons. On the death of his elder brother, the estate of Marnham devolved to him, which he sold and purchased Brothertoft, near Boston, Lincolnshire. He afterwards lived for some time at Enfield, whence in 1810 he removed to Westminster. After the Manchester slaughter, major Cartwright attended a meeting at Birmingham, respecting that unhappy business, and subjected himself to an indictment with others for a conspiracy. He was tried and found guilty at the Warwick assizes, and received sentence, June 1, 1821, to pay a fine of £100 to the king. His death took place at his house in Burton-Crescent, September 23rd, 1824. The Life and Correspondence of major Cartwright were published by his niece in 1826.

CARVAGE, carvagium, the same with carrucage. Henry III. is said to have taken carvage, that is two marks of silver, off every knight's fee, towards the marriage of his sister Isabella to the

emperor. Carvage could only be imposed on tenants in capite.

CARVE, *v.* & *n.*
CAR'VER, *n.*
CAR'VING, *n.*
Ang.-Sax. ceorfan, kærf; Dutch, *kerven*; Goth. *kerfua*; Swed. *karfva*. To cut any substance, either into eatable pieces or elegant forms; to grave or engrave; to divide into portions; to distribute; to follow the profession of a sculptor. Carver is a sculptor; in the more modern acceptation, it means an inferior kind of artist, who executes the ornaments of picture frames, glasses, and furniture; it is also one who serves at table; one who apportions according to his pleasure. Carving, as a noun, signifies, carved figures, sculpture. In the quotation from Shakspeare, illustrative of carving at table, though much has been ingeniously said in defence of the present reading, I am disposed to believe that *carve* is a typographical error, and that, probably, the original word was *crave*.

> But yet had I forgotten to devise
> The noble *kerving* and the portreitures,
> The shape, the countenance, of the figures
> That weren in the oratories three. *Chaucer.*

> Or they will buy his sheep forth of the cote,
> On they will *carven* the shepherd's throat. *Spenser.*

> Run, run, Orlando, *carve* on every tree,
> The fair, the chaste, the unexpressive she.
> *Shakspeare.*

> Brave Macbeth, with his brandished steel,
> Like valour's minion, *carved* out his passage. *Id.*

I do mean to make love to Ford's wife; I spy entertainment in her; she discourses, she *carves*, she gives the leer of invitation. *Id.*

> In this kind, to come in braving arms,
> Be his own *carver*, and cut out his way,
> To find out right with wrong,—it may not be. *Id.*

How dares sinful dust and ashes invade the prerogative of Providence, and *carve* out to himself the seasons and issues of life and death. *South.*

> Yet fearing idleness, the nurse of ill,
> In sculpture exercised his happy skill;
> And *carved* in ivory such a maid, so fair,
> As nature could not with his art compare,
> Were she to work. *Dryden.*

The labourer's share, being seldom more than a bare subsistence, never allows that body of men opportunity to struggle with the richer, unless when some common and great distress emboldens them to *carve* to their wants. *Locke.*

They can no more last like the ancients, than excellent *carvings* in wood like those in marble and brass. *Temple.*

> Well then, things handsomely were served,
> My mistress for the strangers *carved*. *Prior.*

> Were any common booty got,
> 'Twas his each portion to allot;
> For why, he found there might be picking,
> Even in the *carving* of a chicken. *Gay.*

Had Democrates really *carved* mount Athos into a statue of Alexander the Great, and had the memory of the fact been obliterated by some accident, who could have afterwards have proved it impossible; but that it might casually have been? *Bentley.*

A CARVER, to cut up meat, was stiled by the Romans, carptor and carpus; sometimes scissor, scindendi magister, and structor. In the great families at Rome, the carver was an officer of some rank. There were masters to teach the art regularly, by figures of animals cut in wood. The Greeks also had their carvers, called δαιτροι, q. d. dedibitares, or distributors. In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero himself carved the meat. In Sparta, the office on solemn occasions was exercised by some of the chief men. In Scotland, the king has an hereditary carver in the family of Anstruther.

CARVER (Jonathan), was born at Connecticut, North America, in 1732. His father, who was a justice of peace, died when he was only five years of age; and his friends educated him in the medical line. But he preferred a military life; and joining the army, served with considerable reputation till the peace of 1763. He afterwards resolved on travelling, and the route he projected was to explore the interior of America, and to penetrate as far as the Pacific Ocean, which he accomplished, amidst innumerable difficulties, and published an Account of his Travels in 1776. After returning from his arduous journey, he came over to England, in hopes of some preferment, but was disappointed, and, to support himself and his family, was under the necessity of accepting the office of clerk of the lottery. He died in very poor circumstances, in 1780. Besides the Account of his Travels, he wrote an Essay on the Culture of Tobacco.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body, by means of some sharp instrument, especially a chissel. In this sense carving includes statuary and engraving, as well as cutting in wood. But in the strict and limited sense, it is the art of cutting figures in wood. In this sense, according to Pliny, it is prior both to statuary and painting. To carve a figure, it must be first drawn or pasted on the wood. The rest of the block, not covered by the lines of the design, are then to be cut away with little narrow pointed knives. The wood fittest for the use is that which is hard, tough, and close, as beech, but especially box; to prepare it for drawing the design on, it is washed over with white lead tempered in water; which enables it either to bear ink or the crayon, or even to take the impression by chalking. When the design is to be pasted on the wood, this whitening is omitted. The printed side of the figure being wiped over with gum tragacanth dissolved in water, it is clapped smooth on the wood, and let dry; then wetted slightly over, and the surface of the paper gently fretted off, till all the strokes of the figure appear distinctly; after which the carver begins to cut out the figure.

CARUM, in botany, a genus of the digynia order, and pentandria class of plants; natural order, forty-fifth, umbellatæ. The fruit is ovate, oblong, and striated; the involucrum monophyllous: the petals are carinated or keel-shaped below, and marginated by their inflection. 1. C. carui, the caraway of the shops, grows naturally in many places of Britain. It is a biennial plant which rises from seeds one year, flowers the next, and perishes soon after the seeds are ripe. It has a strong aromatic taste, and a taper root like a parsnip, but much smaller, which runs deep into the ground, sending out many small fibres. From the root rise one or two smooth, solid, channelled stalks, about two feet high, garnished with winged leaves, having long naked foot stalks. C. hispanicum is also a biennial, and is a native of Spain. It rises with a stronger stalk than the former, which seldom grows more than a foot and a-half high; but is closely garnished with fine narrow leaves like those of dill. The seeds have an aromatic smell, and a warm pungent taste. They are used in cakes, incrusted with sugar, as sweetmeats, and distilled with spirituous liquors for the sake of the flavor they afford. They are in the number of the four greater hot seeds; and frequently employed as a stomachic and carminative, in flatulent colics, &c.

CARUNCULA, or CARUNCLE, in anatomy, is a term applied to several parts of the human body. See ANATOMY.

CARUNCULÆ PAPPILLARES, or MAMILLARES, little protuberances in the inside of the pelvis of the kidneys, made by the extremities of the tubes, which bring the serum from the glands in the exterior parts, to the pelvis. They are about the size of a pea, and were first observed by Carpus.

CARWAR, a seaport town in the province of North Canara, Hindostan. It was formerly a place of considerable commerce; the East India Company having had a factory here in 1673, but during the reign of Tippoo Saib, the town went entirely to decay. The terra japonica grows here below the Ghauts in abundance: and the Mahratta merchants purchase considerable quantities of salt at Carwar. The northern part of this district is but thinly inhabited, and the hills are very unproductive. Slaves are not found here. At the mouth of the river Carwar is a fort called Sedasiva Row, built by one of the Rajahs of Soonda, whose name it bears. It is fifty-four miles south by east from Goa. Lat. 14° 49 N., long. 74° 4′ E.

CARY (Lucius), lord viscount Falkland, was born in Oxfordshire, about A.D. 1610; a young nobleman of great abilities. About the time of his father's death, in 1633, he was made gentleman of the privy chamber to king Charles I. and afterwards secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and when called into public life, he stood foremost in all attacks on the high prerogative of the crown; but when civil convulsions came to an extremity, he defended the limited powers that remained to monarchy. Anxious however for his country, he seems to have dreaded equally the prosperity of the royal party, and that of the parliament; and among his intimate friends, often sadly reiterated the word—Peace. Yet he freely exposed his person for the king in all hazardous enterprises, and was killed in the thirty-fourth year of his age, at the battle of Newbury. He wrote—1. Speech on all Counsellors about the King. 2. Speech against Lord Keeper Finch and the Judges. 3. Speech against the Bishops. 4. Speech concerning Episcopacy. 5. A Discourse on the Infallibility of the Church of Rome; and a View of some Exceptions made gainst that Discourse. 6. A Letter to F. M.'s five Captious Questions propounded by a Factor of the Papacy, 4to.; and 7. A Letter to Dr. Beale, Master of St. John's College, Cambridge.

CARYA, or CARYAE, a town of Laconia, between Sparta and the borders of Messenia: where stood a temple of Diana, thence called Caryatis.

CARYATES, in antiquity, a festival in honor of Diana, held at Carya. The chief ceremony was a dance said to have been invented by Castor and Pollux, and performed by the virgins of the place. During Xerxes' invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the goddess by such an intermission, the neighbouring swains are said to have assembled and sung bucolismi, or pastorals, which is said to have been the origin of bucolic poetry.

CARYATES, or CARYATIDES, from Carya, a city taken by the Greeks, who led away the women captives: and, to perpetuate their slavery, represented them in buildings as charged with burdens; and thus gave rise to the name of an order of columns or pilasters, under the figures of women, dressed in long robes, serving to support entablatures.

CARYL (Joseph), an eminent divine of the seventeenth century, bred at Oxford, and some time preacher to the society of Lincoln's Inn. He was a frequent preacher before the long parliament, a licenser of their books, a member of the assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he showed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the Restoration, he was silenced by the act of uniformity, and lived privately in London; where, besides other works, he dtstinguished himself by a laborious Exposition of the Book of Job; and died in 1672.

CARYLL (John), an English poet, of the Roman Catholic persuasion, secretary to queen Mary, the wife of James II., and one who followed the fortunes of his master, who knighted him. He was the author of two plays: 1. The English Princess, or the Death of Richard III., 1667, 4to. 2. Sir Salomon, or the Cautious Coxcomb, 1671, 4to; and in 1700 he published The Psalms of David, translated from the Vulgate, 12mo.

CARYOCAR, in botany, a genus of the tetragynia order, and polyandria class of plants: CAL. quinquepartite, the petals five, the styles most frequently four. The fruit is a plum, with nucleuses, and four furrows netted. Three species: West Indies, and South America; C. nuciferum yields a drupe of the size of a man's head, the nuts of which are eatable.

CARYOPHYLLÆUS, in zoology, a genus of the class vermes; order intestina. Body round; mouth dilated and fringed; clay-color; about an inch long. Inhabits the intestines of various fresh-water fishes.

CARYOPHYLLUS, in botany, the clove tree, a genus of the monogynia order, and polyandria class of plants: natural order nineteenth, hesperidea: COR. is tetrapetalous; CAL. tetraphyllous; the belly monospermous below the receptacle of the flower. Of this the principal species is C. aromaticus, which is a native of the Molucca Islands, particularly of Amboyna, where it is principally cultivated. The clove tree resembles, in its bark, the olive; and is about the height of the laurel, which it also resembles in its leaves. No verdure is ever seen under it. It has a great number of branches, at the extremities of which are produced vast quantities of flowers, that are first white, then green, and at last pretty red and hard. When they arrive at this degree of maturity, they are, properly speaking, cloves. As they dry, they assume a dark yellowish cast; and, when gathered, become of a deep brown. The season for gathering the cloves is from October to February. The boughs of the trees are then strongly shaken, or the cloves beaten down with long reeds. Large cloths are spread to receive them, and they are afterwards either dried in the sun, or in the smoke of the bamboo cane. The cloves which escape the notice of those who gather them, or are purposely left upon the tree, continue to grow till they are about an inch in thickness; and these falling off, produce new plants, which do not bear in less than eight or nine years. The clove, to be in perfection, must be full sized, heavy, oily, and easily broken; of a fine smell, and of a hot aromatic-taste, so as almost to burn the throat. It should make the fingers smart when handled, and leave an oily moisture upon them when pressed. In the East Indies, and in some parts of Europe, it is so much admired, as to be thought an indispensable ingredient in almost every dish. It is put into their food, liquors, wines, and enters likewise the composition of their perfumes. Cloves are very hot, stimulating, aromatics; and possess, in an eminent degree, the general virtues of substances of this class. Their pungency resides in their resin; or rather in a combination of resin with essential oil: for the spirituous extract is very pungent; but if the oil and the resin contained in this extract are separated from each other by distillation, the oil will be very mild; and any pungency which it does retain, proceeds from some small portion of adhering resin, and the remaining resin will be insipid. No plant, or part of any plant, contains such a quantity of oil as cloves do. From sixteen ounces, Newman obtained by distillation two ounces and two drams; and Hoffman obtained an ounce and an half of oil from two ounces of the spice. The oil is specifically heavier than water. Cloves acquire weight by imbibing water; and this they will do at some considerable distance. The Dutch, who trade in cloves, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of cloves is ordered, they hang it, for several hours before it is sent in, over a vessel of water, at about two feet distance from the surface. The clove tree is never cultivated in Europe. At Amboyna the company have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually on an average more than two pound of cloves; and, consequently, the collective produce must weigh more than a million. The cultivator is paid with the specie that is constantly returned to the company, and receives some unbleached cottons, which are brought from Coromandel.

CARYOPHYLLUS, the pink. See DIANTHUS.

CARYOPHYLLUS, bennet. See GEUM.

CARYOTA, in botany, a genus of plants of the order monœcia, class polyandria: male CAL. common; COR. tripartite; the stamina very numerous; female one pistil, and a dispermous berry.

CASA (John de la), archbishop of Benevento, was born at Florence in 1503. He was educated at Bologna, and afterwards settled at Rome, where he was appointed clerk of the apostolical chamber in 1538. In 1544 he received the archbishopric of Benevento, and the same year was sent nuncio to Venice, where he displayed great diplomatic abilities. On account of his connexion with cardinal Farnese, he fell into disgrace under Julius III., but under Paul IV. he was made secretary of state. His principal work is entitled Galatea, or Art of Living in the World. He also wrote several beautiful Italian poems; the Lives of Cardinals Contarini and Bembo, &c. He died in 1556.

CASAL, a strong town of Italy, the capital of the duchy of Montferrat, having a citadel and bishop's see, and standing on the right bank of the Po. The principal traffic of the place is in cattle, pigs, and hams; the last of which are much esteemed for their fine flavor. This place has frequently changed masters, having been in possession of the Spaniards, the French, and the king of Sardinia. It has been under the last government since 1746. Long. 8° 19′ E., lat. 45° 12′ N.

CASAS (Bartholomew de las), bishop of Chiapa, was born at Seville, in 1474; and in 1493 sailed, together with his father, with Christopher Columbus, on his second voyage to Hispaniola. On his return to Spain he embraced the state of an ecclesiastic, and obtained a curacy in the island of Cuba, where he employed his time in endeavouring to convert the Indians, and in protecting them, as much as possible, from the cruelty of his countrymen. At last the court, moved by his continual remonstrances, passed several laws in favor of the Indians, and ordered the governors to see them executed. He died at Madrid, in 1566, aged ninety-two. His principal works are, An Account of the Destruction of the Indies; several Treatises in favor of the Indies, against Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards; and also a very curious, and now scarce, work in Latin, on this question, Whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects, and place them under the dominion of another sovereign?

CASATI (Paul), a learned Jesuit, born at Placentia in 1617. After having taught mathematics and divinity at Rome, he was sent into Sweden to queen Christina, whom he prevailed on to embrace the Roman Catholic religion. He wrote, 1. Vacuum Proscriptum. 2. Terra Ma-

chinis Mota. 3. Mechanicorum Libri Octo. 4. De Igne Dissertationes; which is much esteemed. 5. De Angelis Disputatio Theolog. 6. Hydrostaticæ Dissertationes. 7. Opticæ Disputationes. It is remarkable that he wrote this treatise on optics at eighty-eight years of age, and after he was blind. He also wrote several books in Italian. He died at Parma in 1707.

CASAUBON (Isaac), a learned divine and critic, born at Geneva in 1559. He was chosen professor of Greek at Geneva, when only twenty-three years of age; and in 1586 he married a daughter of Henry Stephens, the printer, by whom he had twenty children. Having continued at Geneva about twelve years, he afterwards went to fill the professor's chair at Montpellier; being dissatisfied with his situation, he removed to Paris, in hopes of a professorship which was promised him, but which he never obtained; and though a pension was granted him, it was ill paid. In 1600 he was one of the judges on the Protestant side, in the conference between cardinal du Perron and du Plessis Mornay, and gave his voice against the latter, from which it was thought he was going to change his party and religious opinion; and cardinal du Perron was directed to communicate with him in that view: but the result was the inflexible resolution of Casaubon to hold by the Protestant principles. His pension, however, was increased, and he was appointed librarian to the king in 1603. After the death of Henry IV. he went to England with Sir Henry Wotton, ambassador from king James I., where he was kindly received. King James settled a considerable pension on him, and gave him a prebend at Westminster, and another at Canterbury. He died in 1614, and was interred in Westminster abbey, where a monument was erected to him. He was the author of valuable notes on Diogenes Laertius, inserted in Stephens' edition of that author, 1594. Also the various readings, &c. of Theocritus, in Crispinus' Geneva edition. 3. Strabonis Geographiæ, &c. fol. Genev. 1587. 4. Novum Testamentum Græcum, 16mo. 1587, with notes. 5. Dionysius Halicarnassensis, &c. fol. Genev. 1588. 6. Polyæni Stratagematum Libri VIII, 16mo. 1589. 7. Dicæarchi Geographica, &c. 8vo. Genev. 1589. 8. Aristotelis Opera, &c. fol. Genev. 1605. 9. C. Plinii et Epistolæ, &c. 12mo. Genev. 1591. 10. Theophrasti Characteres, &c. 12mo. 1592. 11. Apuleii Apologia, &c. 4to. 1593. 12. C. Suetonii Tranquilli Opera, 4to. Genev. 1595, Paris. 1610. 13. Publ. Syri Mimi, &c. 8vo. 1598. 14. Athenæi Deipnosophist, &c. 2 vols. fol. Genev. 1597. 15. Historiæ Augustæ Scriptores, 4to. Paris. 1603. 16. Persii Satyræ, &c. 8vo. Paris. 1605, Lond. 1647. 17. De Satyricæ Græcorum, &c. 8vo. Paris. 1605. 18. Polybii Opera, &c. fol. Paris. 1609. 19. Josephi Scaligeri Opera, 4to. Paris. 1610, Francof. 1612. 20. De Rebus Sacris et Ecclesiasticis Exercitationes XVI.

CASAUBON (Meric), the son of Isaac, was born at Geneva in 1599. He was bred at Oxford, and took the degree of M. A. in 1621. The same year he published a book in defence of his father, against the calumnies of certain Roman Catholics; which gained him the favor of king James I. and a considerable reputation abroad. He was made prebendary of Canterbury by archbishop Laud. In the beginning of the civil war he lost all his promotions, but still continued to publish. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed him in writing the history of the war; but he declined it, owning, that his subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered £300 or £400 to be paid him by Cromwell, a bookseller in London, on demand, without requiring from him any acknowledgment. But this offer he rejected, though his circumstances were then low. At the same time it was proposed by his friend Mr. Greaves, who belonged to the library at St. James's, that if Casaubon would gratify Cromwell, all his father's books (which were then in the royal library, having been purchased by king James) should be restored to him, and a pension of £300 a year paid to the family, as long as the youngest son of Dr. Casaubon should live; but this also was refused. He likewise refused handsome offers from Christina queen of Sweden, being determined to spend the remainder of his life in England. At the Restoration he recovered all his preferments, and continued writing till his death in 1671. He was the author of an English translation of Antoninus's Meditations, and of Lucius Florus; editions of several of the classics, with notes; with many other works: and he left a number of MSS. to the university of Oxford.

CASCABLE, the knob or button of metal, behind the breech of a cannon, as a sort of handle whereby to elevate and direct the piece. The neck of the cascable is the part which joins it to the breech-mouldings; its diameter is three-quarters of a calibre; that of the button something more than a calibre. The length of the cascable is always two calibres and a quarter.

CAS'CADE, Fr. *cascade*; Ital. *cascata*; from *cascare*, to fall. A cataract; a water-fall; generally applied to those which are either artificial, or of minor or secondary importance.

> Rivers diverted from their native course,
> And bound with chains of artificial force,
> From large *cascades* in pleasing tumult rolled,
> Or rose through figured stone, or breathing gold.
>
> *Prior.*

> The river Teverone throws itself down a precipice, and falls by several *cascades* from one rock to another, till it gains the bottom of the valley.
>
> *Addison.*

CASCADES are either natural, as that at Tivoli, &c. or artificial, as those at Versailles, &c. and either fall with gentle descent, as those of Sceaux; or in form of a busset, as at Trianon; or down steps, in form of perron, as at St. Cloud; or from bason to bason, &c.

CASCHROM, a kind of lever, or crooked spade, used instead of the plough, upon rocky ground, in the island of Barray.

CASE, *v.* & *n.*
CA'SE-KNIFE, *s.*
CA'SE-HARDEN,
CA'SE-SHOT,
CA'SE-WORM.

Fr. *caisse*; Ital. *cassa*; Span. *caxa*; Lat. *capsa*; Καμψα. Such are the derivations from the southern languages. Those from the northern are equally close. Mœs. Goth. *kas;* Sw. *kasse;* Hung. *kass;* Ic. *cash;* Dutch *kas;* Scot. *cassie.* All of which mean something that contains. A case is primarily, that which covers or contains any thing else; as a covering; a box; a sheath. In its secondary meanings, it still clearly refers to the idea of including. It indicates condition with respect to external circumstances; the state of things, of the body, or of disease; a statement of a disease; a narrative, or question, submitted to a barrister, for his opinion; the condition of the body, with respect to plumpness or leaness; a contingence; a possible event; a particular instance; representation of any fact or question; and the change in the terminations of nouns. In case, is a form of supposition, meaning if it should happen. Johnson says, this is a form of speech now little used: but why he says so, is not apparent, the phrase being still frequently heard. To case is, to inclose in a case; to envelope as a case does; to put on an exterior covering of materials, different from those of the interior; and, lastly, but unusually, to uncover [illegible] skin. The neuter verb is employed only ludicrously, in the signification of putting cases, containing representations of facts.

And such a *case* betide, and that as fast,
That Troilus wel understode that she
Na's nat so kinde as that hire ought to be;
And, finally, he wote, now out of dout
That al is lost that he hath ben about.
Chaucer. Troilus and Creseide.

Unworthy wretch, quoth he, of so great grace,
How dare I think such glory to attain?
These that have it attained were in like *case,*
Quoth he, as wretched, and lived in like pain.
Spenser.

Well, I do find each man most wise in his own *case.*
Sidney.

Heart, once be stronger than thy continent,
Crack thy frail *case.* *Shakespeare.*

Question your royal thoughts, make the *case* yours.
Id.

Thou lyest, most ignorant monster, I am in *case* to justle a constable. *Id.*

Case ye, *case* ye, on with your vizors. *Id.*

Thy cry went once for thee,
And still it might, and yet it may again,
If thou would'st not entomb thyself alive,
And *case* thy reputation in a tent. *Id.*

For in *case* it should be certain, hard it cannot be for them to show us where we shall find it; that we may say, that these were the orders of the apostles.
Hooker.

It was well; for we had rather met with calms and contrary winds, than any tempests; for our sick were many, and in very ill *case.* *Bacon.*

If he be not apt to beat over matters, and to call up one thing to prove and illustrate another, let him study the lawyer's *cases;* so every defect of the mind may have a special receipt. *Id.*

A sure retreat to his forces, in *case* they should have an ill day, or unlucky chance in the field. *Id.*

In each, seven small brass and iron guns, charged with *case-shot.* *Clarendon.*

Quoth Ralph, I should not, if I were,
In *case* for action, now be here. *Hudibras.*

The low-roofed tortoises do dwell
In *cases* fit of tortoise-shell. *Marvell.*

Each thought was visible that rolled within,
As through a crystal *case* the figured hours are seen.
Dryden.

Some knew the face,
And all had heard the much lamented *case.* *Id.*

Pray have but patience till then, and when I am in a little better *case,* I'll throw myself in the very mouth of you. *L'Estrange.*

They presently fall to reasoning and *casing* upon the matter with him, and laying distinctions before him. *Id.*

Cadises, or *case-worms,* are to be found in this nation, in several distinct counties. *Floyer.*

Just then, Carissa drew, with tempting grace,
A two-edged weapon from the shining *case.* *Pope.*

My youth may be made, as it never fails in executions a *case* of compassion.
Id. Preface to his Works.

The *case* of the holy house is nobly designed, and executed by great masters. *Addison.*

The king always acts with a great *case-knife* stuck in his girdle, which the lady snatches from him in the struggle, and so defends herself. *Id.*

Your parents did not produce you much into the world, whereby you have fewer ill impressions; but they failed, as is generally the case, in too much neglecting to cultivate your mind. *Swift.*

The priest was pretty well in *case,*
And shewed some humour in his face. *Id.*

Chalybeate water seems to be a proper remedy in hypochondriacal *cases.* *Arbuthnot.*

The atheist, in *case* things should fall out contrary to his belief or expectation, has made no provision for this *case.* *Tillotson.*

The *case* is plain, the monarch said,
False glory hath my youth mislead. *Gay.*

Love calls me hence, a favourite cow
Expect me near yon barley-mow,
And when a lady's in the *case,*
You know all other things gives place. *Id.*

For who, to thoughtless ignorance a prey,
Neglects to hold short dalliance with a book?
Who there but wishes to prolong his stay,
And on those *cases* cast a lingering look.
Duncombe.

Indeed! Pray which of the houses use you ill?—There's the Red Lion an't half so civil as the Old Red Lion. There's the White Horse, if he wasn't *case-hardened,* ought to be ashamed to show his face.
Sheridan.

CASE, in grammar. See GRAMMAR.

CASE, in printing, a large flat oblong frame placed aslope, divided into several little square cells; in each of which are lodged a number of types of the same kind, whence the compositor takes them out, as he needs them, to compose his matter. See PRINTING.

CASEARIA, in botany, a genus of plants of the class decandria, order monogynia. CAL. five-leaved: COR. none; nectary four or five-leaved, alternating with the stamens: CAPS. berried within, three-valved, one-celled: SEEDS wrapped in a pulpy pellicle. Species twelve, ten natives of the West Indies and South America; the other two natives of India.

CASE-HARDENING, is a superficial conversion of iron into steel, by cementation with vegetable or animal coals. This operation is generally practised upon small pieces of iron

made came to be converted into all window. Others refer it to A casement is a little moveable dy within a larger, turning on ially glazed with glass or [illegible] instead.

ut may leave a casement of the great
ow where we play, open, and the moon
at the casement.
Shakspeare. Midsummer Night's Dream.

pened with the moon, and fly
e room to window over,
prudent fall, the casement,
s but yet with some amazement.
Hudibras.

d pence the flying Nicker flings,
copper shower the casement rings. *Gay.*

e rogues who, at a distance,
mass throws out of a casement;
an do for your assistance
afford you one amusement. *J. H. Stevenson.*

ASE, or CASEMATE, in architecture, a moulding, which some architects make of a circle, and others a one-fourth.

EOUS, *adj.* Lat. *caseus;* resembling cheesy.

ome parts are from the serous parts of the
Floyer on the Humours.

ERN, *n.* Fr. *caserne;* a lodgment erected en the rampart and the houses of fortified to serve as apartments or lodgings for the rs of the garrison. They have usually two in each, for six soldiers, who mount guard ately; the third part being always on duty.

ASH, *v.* & *n.* | Fr. *caisse, cassa;* Ital.
SHIER, *n.* | *cassa;* Span. *caxa;* Goth.
SH-BOOK, *n.* | *kista;* Dutch, *kist, kas;*
SH-KEEPER, *n.* | Swed. *cassa;* Lat. *capsa;*

ney in hand, or in a coffer; coin. By a nymical figure, the container is put for the ng contained. To cash is to give money for note of hand, or other mercantile security. ashier and cashkeeper signify the person who the charge of the money; the receiver and ayer. The first of these two words is that which now most in use.

A thief, bent to unhoard the cash
Of some rich burgher. *Paradise Lost.*

If a steward or cashier be suffered to run on, with bringing him to a reckoning, such a sottish forbearance will teach him to shuffle. *South.*

of cash, or notes, he'll never mind,
And knows no losses, while the muse is kind. *Pope.*

He sent the thief, that stole the cash away,
And punish'd him that put it in his way. *Id.*

Dispensator was properly a cashkeeper, or paymaster. *Arbuthnot.*

If cash run low, his funds in fee,
Are, or for sale or mortgage, free. *Gay.*

[illegible] don't rule, ambition, and such alone,
Cash rules the grove, and fells it too besides;
Without cash camps were thin, and courts were none;
Without cash, Malthus tells you "Take no brides."
So cash rules love the ruler, on his own
High ground, as virgin Cynthia sways the tides.
Byron. Don Juan.

A fellow in a market town,
st musical, cried razors up and down,

And offered twelve for eighteen-pence;
Which certainly seemed wonderous cheap.
And for the money quite a heap,
As every man would buy with *cash* and sense.
Wolcot.

Cash, or Cash'ier, *v.* Fr. *casser*; Lat. *cassare*. To discard; to dismiss with reproach. It is now mostly used to express the breaking of an officer. There is another sense of the word, equivalent to annulling or vacating; as appears in the quotations from South and Locke.

Does't not go well? Cassio hath beaten thee;
And thou by that small hurt hast *cashiered* Cassio.
Shakspeare.

And thereupon *cashing* the greatest part of his land army, he only retained one thousand of the best soldiers. *Gorges.*

Seconds in factions many times prove principals; but many times also they prove cyphers, and are *cashiered.* *Bacon.*

If I had omitted what he said, his thoughts and words being thus *cashiered* in my hands, he had no longer been Lucretius. *Dryden.*

If we should find a father corrupting his son, or a mother her daughter, we must charge this upon a peculiar anomaly and baseness of nature; if the name of nature may be allowed to that which seems to be utter *cashiering* of it, and deviation from, and a contradiction to, the common principles of humanity. *South.*

Some *cashier*, or at least endeavour to invalidate, all other arguments, and forbid us to hearken to those proofs, as weak or fallacious. *Locke.*

The ruling rogue, who dreads to be *cashiered*,
Contrives, as he is hated, to be feared. *Swift.*

CASHELL, or Cashel, a well built city of Tipperary, about three miles from the river Suir. It is the see of an archbishop; and it formerly contained a palace in which the kings of Munster resided. The fine ruins of an old Gothic cathedral, supposed to have been built by St. Patrick, are worthy of notice. It is said to have been the first stone edifice in Ireland. Its appearance, together with the ruins of Cormac's chapel, and hall of audience, is extremely picturesque, being built on the edge of a steep rock. The tomb of Cormac is seen in this chapel. At the east angle of the building stands a lofty round tower, the architecture of which is a great curiosity, particularly the roof, which is formed of stones so admirably jointed that it appears perfectly smooth, as if covered with a fine cement. The tower is fifty-four feet in circumference, five stories high, and communicates with the chapel by subterranean passages. The modern buildings worthy of note are the cathedral, of Grecian architecture, the archbishop's palace, a plain but commodious building, containing an excellent library, and many curious manuscripts; a handsome market-house, a session's house, a county infirmary, a charter school handsomely endowed, and barracks for foot soldiers. It is a corporate town, and sends one member to the imperial parliament. It is seventy-six miles from Dublin

CASHMERE, the ancient Aspira, a province of northern Hindostan, now belonging to Afghaunistaun. Its form is nearly oval: tradition says, with some appearance of truth, that it was once a large lake or bason, and that the waters forced themselves a passage into the river Jhelum. It forms a very beautiful and fertile valley, of about ninety miles in length and forty in breadth, bounded on the north and north-east by the Himmaleh mountains, on the south and south-east by Kishtewar, and on the west and south-west by Lahore, Pounce, Muzufferhabad, &c. Its limits towards the last country are a low thick wood, skirted by a rivulet.

Eastern writers speak of this valley as a perpetual paradise: it is 'well watered everywhere' certainly, and its natural defences are at once magnificent and strong. Roses, violets, and innumerable species of flowers, grow wild; and venomous reptiles, so common in various surrounding countries, are here unknown. The principal streams are the Jhelum, and the Chota Singh. The chief towns, Cashmere, Sampre, and Islamabad. The mountains, for the most part, are covered with trees and verdure, affording excellent pasture for cattle. Amongst them are many romantic valleys, the inhabitants of which have scarcely any communication with the plains; and on account of their poverty, and the inaccessible situation of their dwellings, never have been subdued. The vale of Cashmere itself is generally flat, and very fertile in rice, the general food of the districts. Wheat and barley are cultivated at the foot of the hills, where also all the fruits of Europe flourish. A superior saffron is also produced in Cashmere, and iron of an excellent quality abounds in some of the mountains. The sengerah, or water-nut, of the lakes, forms a portion of the food of the lower class. The shawls of Cashmere are manufactured from wool of the goats of Thibet. It is, when imported, of a dark gray tint, and bleached in Cashmere by a preparation of the flour of rice. No other wool but that of Thibet ever succeeds in this manufacture. The piece, which in the weaving always has the rough side downwards, generally weighs from ten to twelve pounds; the borders are joined on afterwards. Plain shawls are woven by two men; the flowered or spotted ones require a third assistant; and the manufacture is so slow, that not more than a quarter of an inch of the finest sort is made in the course of a day. Sixteen thousand looms are said to be employed upon this manufacture; and 80,000 shawls are made annually. The revenue of the province is frequently transmitted in these to Cabul. Here also is made the finest writing paper of the east: the other exports are, sugar, paper, lacquered ware, otto of roses, and drugs. The natives are remarkably ingenious and acute; white, robust, and well made: the females have been long celebrated for their beauty. The whole country does not contain more than 500,000 inhabitants.

Cashmere, or Serinaghur, the capital of the above province, stands on each side of the river Jhelum, over which there are five wooden bridges: the breadth of the city is irregular, in some places being nearly two miles; and it extends about three miles on each side of the Jhelum. It is without fortifications, but there is a citadel, called Shore Ghur, in the south-east quarter, where the governor resides. The houses are chiefly of wood, with walls of brick and mortar: and on

nually. The revenue of the province is fre-
ently transmitted in these to Cabul. Here
o is made the finest writing paper of the east:
e other exports are, sugar, paper, lacquered
re, otto of roses, and drugs. The natives are
markably ingenious and acute; white, robust,
d well made: the females have been long cele-
ated for their beauty. The whole country
es not contain more than 500,000 inhabitants.
CASHMERE, or SERINAGHUR, the capital of the
ove province, stands on each side of the river
elum, over which there are five wooden bridges:
e breadth of the city is irregular, in some places
ing nearly two miles; and it extends about
ree miles on each side of the Jhelum. It is
ithout fortifications, but there is a citadel, called
hore Ghur, in the south-east quarter, where the
vernor resides. The houses are chiefly of
ood, with walls of brick and mortar: and on

the wooden roofs a bed of fine earth is seen, which in the summer is sown with flowers. The streets are narrow, and choked with filth. The public buildings are unimportant; but in the neighbourhood are the remains of several handsome palaces, built by the Hindostanee emperors. In the north-east quarter of the town is the Dall Lake, an oval of five or six miles in circuit, and communicating with the Jhelum by a narrow channel. On the east side of this beautiful sheet of water is a detached hill, called Tukhti Solomon, on which stands a mosque, dedicated to king Solomon. In the centre is an island, containing the palace Shah al imaret, or 'prince of building.' Here its founder, the emperor Jehangire, and his successor Shah Jehan, retired from the heat and bustle of an Indian court, to enjoy the delightful tranquillity of this almost unearthly scene. Cashmere is 587 travelling miles from Lahore, 1564 from Calcutta, and 1822 from Madras.

CASHOO, a medicinal and aromatic drug, used in Hindostan by the natives, who chew it either alone, or mixed with areca. It is extracted from a tree called catee, by decoction, maceration, and evaporation. It is said to strengthen the stomach, sweeten the breath, stop coughing, fasten loose teeth, &c. Kempfer says it is prepared at Odowara, in the various forms of pills, flowers, small idols, &c.

CASI, in the Persian police, one of the two judges under the nadab, who decide all religious matters, grant divorces, &c., and have deputies in all cities of the kingdom.

CASIMIR (Matthias Sorbiewski), a Polish Jesuit, born in 1597. He was a most excellent poet. His odes, episodes, and epigrams, have been thought equal to those of the finest wits of Greece and Rome. Dr. Watts has translated one or two of his small pieces, which are added to his Lyric Poems. He died at Warsaw in 1640, aged forty-three. The best edition of his poems is that of Paris, 1759.

CASING OF TIMBER WORK, among builders, is the plastering the house all over the outside with mortar, and then striking it while wet by a ruler, with the corner of a trowel, to make it resemble the joints of free-stone.

CASK, *v.* & *n.* } Fr. *casque*; It. and Sp.
CASK'ET, *v.* & *n.* } *casco*; Lat. *cadus, cassis.*
Serenius refers the word case to Mœs. Goth. kas, vas, vasculum; and it seems probable that cask is from the same root. A cask, in the common usage of the word, signifies a barrel or vessel of wood, to contain liquor or provisions. Poetically, it is a helmet, a head-piece. The diminutive casket, is a small box, in which to deposit jewels, or things of value.

Great inconveniences grow by the beer *casks* being commonly so ill-seasoned and conditioned, as that a great part of the beer is ever lost and cast away.
Raleigh.

Beer, if it be over new or over stale, over strong or not sod, smell of the *cask*, sharp or sour, is most unwholesome. *Burton. Anat. Mel.*

Let thy blows, doubly redoubled,
Fall like amazing thunder on the *casque*
Of thy pernicious enemy. *Shakspeare.*

They found him dead and cast into the streets,
An empty *casket*, where the jewel, life,
By some damned hand was robbed and ta'en away.
Id.

I have writ my letters, *casketed* my treasure, and given order for our horses. *Id.*

Mine eye hath found that sad sepulchral rock,
That was the *casket* of heaven's richest store. *Milton.*

Perhaps to-morrow he may change his wine,
And drink old sparkling Alban or Setine,
Whose title, and whose age, with mould o'ergrown,
The good old *cask* for ever keeps unknown. *Dryden.*

And these
Sling weighty stones, when from afar they fight:
Their *casques* are cork, a covering thick and light. *Id.*

Why does he load with darts
His trembling hands, and crush beneath a *cask*
His wrinkled brows? *Addison.*

This *casket* India's glaring gems unlocks,
And all Arabia breathes from yonder box. *Pope.*

In the host of Xerxes they served on foot; and their arms were a dagger, or a javelin, a wooden *casque*, and a buckler of raw hides. *Gibbon.*

Ten thousand *casks*
For ever dribbling out their base contents,
Touch'd by the Midas finger of the state,
Bleed gold for ministers to sport away. *Cowper.*

CASKET. See CABINET.

CASKETS, in the sea language, are small ropes made of finnet, and fastened to gromets, or little rings upon the yards, to make fast the sail to the yard when it is to be furled.

CASLON (William), an eminent letter-founder, born in 1692, in Hales Owen, Shropshire. He served an apprenticeship to an engraver of ornaments on gun-barrels; and carried on this trade in Vine-street, near the Minories. He also exercised his ingenuity in making tools for the bookbinders, and for the chasing of silver plate. While he was thus engaged, Mr. Bowyer accidentally saw the lettering of a book which he thought uncommonly neat; and enquiring who the artist was that made the letters, was led to cultivate an acquaintance with him. Not long after, Mr. Bowyer took him to see Mr. James's foundry. Caslon had never before seen any part of the business; and being asked by his friend if he thought he could cut types, he requested a day to consider the matter, and then replied that he had no doubt but he could. Upon this, Messrs. Bowyer, Bettenham, and Watts, had such confidence in his abilities that they lent him £500, and he applied himself to his new business with equal assiduity and success. In 1720 the Society for Promoting Christian Knowledge deemed it expedient to print the New Testament and Psalter in the Arabic language, for the benefit of the poor Christians in Palestine, Syria, Mesopotamia, Arabia, and Egypt; and Mr. Caslon was appointed to cut the fount; he distinguished his specimens by the name of English Arabic. He arrived at length to such perfection in type founding, that he not only freed us from the necessity of importing types from Holland, but, in the beauty and elegance of those made by him, he so far exceeded the productions of the best artificers, that his types were exported to the continent; and his foundry became one of the most celebrated in Europe. He died in 1766.

CASPIAN Sea, a large central lake of Asia, bounded by the province of Astrakhan on the north, and by Persia on the south-east and west. It is upwards of 400 miles long from south to north, and 300 broad. It forms several gulfs, and contains between Astrakhan and Astrabad an incredible number of small islands. Its bottom is mud, but sometimes mixed with shells. At the distance of some miles from land it is 500 fathoms deep; but on approaching the shore it is everywhere so shallow, that the smallest vessels, if loaded, are obliged to remain at a distance. Being enclosed on all sides by land, and its banks being in the neighbourhood of very high mountains, its navigation is perfectly different from that of every other sea. Certain winds prevail with such absolute sway, that vessels are often deprived of every resource; and in its whole extent there is scarcely a port that can be called safe. The north, the north-east, and the east winds, blow frequently, and occasion most violent tempests. Along the eastern shore the east winds prevail; for which reason vessels bound from Persia to Astrakhan always direct their course along this shore. Although the extent of this sea is immense, the variety of its productions is exceedingly small. This undoubtedly proceeds from its want of communication with the ocean, which cannot impart to it any portion of its inexhaustible stores. But the animals which it nourishes multiply to such a degree, that the Russians, who alone are in condition to make them turn to account, justly consider them as a never-failing source of profit and wealth. Its fisheries are the sole occupation of the people inhabiting the banks of the Wolga and the Jaik. Salmon, sturgeon, and other fish, abound in all parts, as well as in the rivers that communicate with it, and which they ascend at spawning time. Seals also are extremely numerous. The varieties of the species are diversified, however, only by the color. Some are quite black, others white; some whitish, yellowish, &c., and some streaked like a tiger. See Phoca. They crawl upon the islands, where the fishermen kill them with long clubs. One is hardly despatched when others come to his assistance and share his fate. They are exceedingly tenacious of life, and endure more than thirty hard blows before they die. They will even live for several days after having received many mortal wounds. At Astrakhan a sort of gray soap is made of their fat mixed with pot-ashes, which is much valued for its property of cleansing and taking grease from woollen stuffs. The greatest numbers are killed in spring and autumn. Many small vessels go from Astrakhan merely to catch seals. The only shell fish, found in the Caspian, are three or four species of cockle, the common muscle, some species of snails, and one or two others. It abounds, however, in birds of different kinds. Geese, ducks, storks, herons, crows, &c. frequent the shores. Of birds properly aquatic, it contains the grebe, the crested diver, the pelican, the cormorant, and almost every species of gull. The waters are very impure, the nature of its bottom affecting it greatly. In general, indeed, they are salt; but the saltness is diminished by the north, the north-east, and north-west winds; the north winds often causing the rivers to discharge into it vast quantities of troubled water impregnated with clay. These variations, to which the sea is exposed, are more or less considerable, according to the nature of the winds; they affect the color of the river waters to a certain distance from the shore, till these mixing with those of the sea, which then resume the ascendancy, the fine green color appears, which is natural to the ocean. It is well known that, besides its salt taste, all sea water has a sensible bitterness, which must be attributed not only to the salt itself, but to the mixture of different substances that unite with it, particularly to different sorts of alum, the ordinary effect of different combinations of acids. The waters of the Caspian have a peculiar acrid taste, which affects the tongue with an impression similar to that made by the bile of animals: a property, of which this sea is not equally perceptible at all seasons. When the north and north-west winds have raged for a considerable time, this taste is sensibly felt; but when the wind has been south, very imperfectly. To account for this phenomenon, we must observe, that the Caspian is surrounded on its west side by the mountains of Caucasus, which extend from Derbent to the Black Sea. These abound with combustible and mineral substances; and springs of naphtha are common at the foot of them. It is chiefly to the naphtha that we must attribute the cause of the bitterness peculiar to its waters; and it is certain, that the north and north-west winds detach the greatest quantities of it. But it is not a bitter taste alone, that the naphtha communicates to the waters of the Caspian: these waters were analysed by M. Gmelin, and found to contain, besides the common sea-salt, a considerable proportion of Glauber salt, intimately united with the former, and which is evidently a production of the naphtha. As the waters of the Caspian have no outlet, they are discharged by subterranean canals through the earth, where they deposit beds of salt; the surface of which corresponds with that of the level of the sea. The two great deserts which extend from it to the east and west, are chiefly composed of saline earth, in which the salt is formed by efflorescence into regular crystals; for which reason salt showers and dews are exceedingly common in that neighbourhood. The salt of the marshes at Astrahkan, and that found in efflorescence in the deserts, are by no means pure sea-salt, but much debased by Glauber salt. In many places, indeed, it is found with crystals of a lozenge shape, which are peculiar to it, without any cubical appearance, like those of sea salt. A great deal has been written on the successive augmentation and decrease of the Caspian Sea, but with little truth. There is indeed a certain rise and fall of its waters, but in which no observation has ever discovered any regularity. Many suppose, it is not improbable, that the shores of the Caspian were much more extensive than at present, and that it once communicated with the Black Sea. It is probable too, that the level of this last was formerly much higher. If then it be allowed, that the waters of the Black Sea, before it procured an exit by the Straits of Constantinople, rose several fathoms

above their present level, which, from many concurring circumstances, may easily be admitted, it follows, that all the plains of the Crimea, the Kuman, the Wolga, and the Jaik, and those of Great Tartary beyond the lake of Aral, in ancient times formed but one sea, which embraced the north extremity of Caucasus by a narrow strait of little depth; the vestiges of which are still obvious in the river Mantysch.

CASS, or
CAS'SATE, *v.* & *n.* } Fr. *casser*; low Lat. *cassare*. To vacate; invalidate; make void; nullify. Cassation is the act of making null and void
CAS'SATION, *n.*

To *cass* all old and unfaithful hands, and entertain new. *Raleigh.*

This opinion supersedes and *cassates* the best medium we have. *Ray.*

CASSANA (John Augustine), an eminent painter, was born in 1664; and educated, together with his brother Nicholas, by their father John Francis Cassana, a Genoese. His principal works were paintings of animals and fruits, and in that style he arrived at a high degree of eminence, imitating nature with exactness, beauty, and truth, and expressing the various plumage of his birds, and the hairs of the different animals, with great delicacy. At last he determined to visit Genoa, where his family had lived in esteem; and took with him several pictures which he had already finished. But by attempting to appear as a person of greater wealth and consequence than he really was, and by giving presents of pictures to several of the principal nobility of that city, he unhappily reduced himself to the most necessitous circumstances, and was almost deprived of the means to procure even the necessaries of life. He died in 1718.

CASSANA (Nicholas, or Nicoletto), an eminent Italian painter, brother to the preceding, was born at Venice in 1659. He soon distinguished himself by the beauty of his coloring, the gracefulness of his figures in historical compositions, as well as portrait; in which last he peculiarly excelled. People of the first rank were anxious to obtain their portraits. The grand duke of Tuscany invited Nicoletto to his court; where he painted the portraits of that prince, the princess his consort, and many of the principal nobility of Florence. Among other historical subjects, he executed a very beautiful design, on the Conspiracy of Catiline. Nicoletto was at last invited to England, and introduced to queen Anne, to paint her portrait; but he did not enjoy his good fortune long, as he died in London, in 1713.

CASSANDER, king of Macedon after Alexder the Great, was the son of Antipater. He made several conquests in Greece, abolished democracy at Athens, and gave the government of that state to the orator, Demetrius Phalereus. Olympias, the mother of Alexander, having caused Aridæus and his wife Euridyce, with others of Cassander's party, to be put to death; he besieged Pydne, whither the queen had retired, took it by stratagem, and slew her. He married Thessalonice, the sister of Alexander; and killed Roxana and Alexander, the wife and son of that conqueror. At length he entered into an alliance with Seleucus and Lysimachus, against Antigonus and Demetrius; over whom he obtained a great victory near Ipsus, in Phrygia, A.A.C. 301, and died three years after, in the nineteenth year of his reign.

CASSANDRA, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy, provided she would consent to his love. Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the tempter, and broke her word. Apollo, being enraged, revenged himself by causing no credit to be given to her predictions; hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agamemnon, who loved her to distraction; but she predicted to him in vain, that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but their death was avenged by Orestes.

CASSANDRA, in natural history, a very elegant sea-shell of the concha globosa kind, more usually known by the name of the lyra or harp shell.

CASSANO, a town of Italy in the Milanese, late in the republican department of the Adda, rendered memorable by an obstinate battle, fought between the Germans and French in 1705. It is seated on the Adda.

CASSAVI. See JATROPHA.

CASSAY, a province in the Burmhan empire, bounded on the north by Cachar and Assam, on the east by the river Keenduem, south by Arracan, and west by Bengal. It lies in about the 24° of north latitude. The capital is Munipoor. The natives are called Katthee by the Burmhans, and much resemble the native tribes of Hindostan. Many of them, formerly prisoners of war, are now settled in the neighbourhood of Unimerapoora, where their skill as artisans obtains them a comfortable living. They are the gunsmiths of the whole Burmhan empire, and the only cavalry employed in their armies. Their music is said to be remarkably pleasant to the English ear. See BURMHAN EMPIRE.

CASSEL, a considerable town of Germany, the capital of the electorate, and the residence of the elector of Hesse Cassel. It is situated on the river Fulda, in Lower Hesse, and is divided into the Old Town, the Lower New Town, and the Upper New Town. Few places contain more numerous or more elegant public buildings than the last The principal are the state house, the foundry, the arsenal, the parade square, the barracks, the church of St. Martin, public library, and new house of correction. Strangers also are much pleased with the public gardens, the orangery, baths, and menagerie. The noble castle of Weissenstein is about half a mile out of the town, and is a most princely seat. In the Upper New Town is the school, called Collegium Carolinum, founded in 1709. The museum is very rich in antiquities. There are manufactories here of china and woollen stuffs, but the trade of the town is small. During the seven years' war it was long the head-quarters of the French. The fortifications were afterwards destroyed and have not been renewed; the gates were removed to the extremity of the old out-works, and the space thus cleared was laid out in streets, gardens, and promenades. Population in 1810, 20,300. Cassel was the capital of Jerome Buonaparte's kingdom of Westphalia. It is fifty miles south-east of Paderborn, and eighty-four north-east of Coblentz.

CASSIA, in botany, a genus of the monogynia order and decandria class of plants; natural order thirty-third, lomentaceæ: CAL. pentaphyllous; petals five; antheræ upper three barren; lower three beaked: a leguminous plant. There are fifty-nine known species, all natives of warm climates. The most remarkable are, 1. C. fistula, the purging cassia of Alexandria. It is a native of Egypt and both Indies, where it rises to the height of forty or fifty feet. The flowers are produced at the end of the branches, each standing upon a long foot-stalk; these are composed of fine yellow concave petals, which are succeeded by cylindrical pods from one to two feet long, with a dark brown woody shell, divided into many cells by transverse partitions, each containing one or two oval, smooth, compressed seeds, lodged in a blackish pulp, which is used in medicine. There are two sorts of this drug in the shops; one brought from the East Indies, the other from the west. The pods should be chosen weighty, new, not rattling (from the seeds being loose within them) when shaken. The pulp should be of a bright shining black color, and a sweet taste. Greatest part of the pulp dissolves both in water and rectified spirit; and may be extracted from the cane by either. The shops employ water, boiling the bruised pod therein, and afterwards evaporating the solution to a due consistence. The pulp is a gentle laxative medicine, and frequently given in a dose of some drams in costive habits. Geoffroy says, it does service in the tension of the belly, which sometimes follows the imprudent use of antimonials: and that it may be advantageously acuated with the more acrid purgatives, or antimonial emetics, or employed to abate their force. 2. C. senna is a shrubby plant cultivated in Persia, Syria, and Arabia, for the leaves, which form a considerable article of commerce. They are of a lively yellowish green color, a faint not very agreeable smell, and a subacrid, bitterish, nauseous taste. They are brought from the above places, dried and picked from the stalks, to Alexandria in Egypt, and thence imported into Europe. Senna is a very useful cathartic, operating mildly, and yet effectually: and if judiciously dosed and managed, rarely occasioning the ill consequences which too frequently follow the exhibition of the stronger purges. The only inconveniences complained of in this drug are, its being apt to produce griping pains. The griping quality depends upon a resinous substance, which, like the other bodies of this class, is naturally disposed to adhere to the coats of the intestines. The smell of senna resides in its more volatile parts, and may be discharged by lightly boiling infusions of it made in water. The colleges both of London and Edinburgh have given several formulæ for the exhibition of this article, such as those of infusion, powder, tincture, and electuary. The dose of senna in substance, is from a scruple to a drachm: in infusion, from one to three or four drachms. It has been customary to reject the pedicles of the leaves of senna as of little or no use: Geoffroy however observes, that they are not much inferior in efficacy to the leaves themselves. The pods or seed-vessels are by the college of Brussels preferred to the leaves: they are less apt to gripe, but proportionably less purgative.

Cassia lignea. See Laurus

Cassia, poet's. See Osyris.

CASSIBELAN, or Cassibelaunus, king of the Trinobantes, the son of Heli, succeeded his brother king Lud, about A.A.C. 62. About five years after his accession, Julius Cæsar having landed his army on the British coast, Cassibelan was chosen commander in chief of the British forces; but these undisciplined and disunited troops, though they made a brave opposition, fell an easy conquest to the veteran Romans: A.A.C. 55. Cassibelan therefore made the best terms he could with Cæsar, and engaged to pay a tribute of about £3000 a year to the Romans, and to send hostages for the payment. Only two of the British states, however, fulfilled their part of this treaty: whereupon Cæsar returned next year with a fleet of 800 ships; and though Cassibelan opposed him with all the united force of South Britain, he was repeatedly defeated; his capital burnt, and Mandubratius, Cæsar's ally, established as king of the Trinobantes. Cassibelan died A.A.C. 48.

CASSIDA, in zoology, a genus of insects of the order of coleoptera. The feelers are like threads, but thicker on the outside; the elytra are marginated; and the head is hid under the thorax; from which last circumstance is derived the name of the genus. The larva of this species, by the help of the two prongs which are to be found at its hinder extremity, makes itself, with its own excrements, a kind of umbrella that shelters it from the sun and rain. This larva casts its slough several times. Thistle and verticillated plants are inhabited by these insects. There is one species, the chrysalis of which resembles an armorial escutcheon. It is that which produces our variegated cassida, and is a very singular one. Numbers of them are found on the side of ponds.

CASSIDARIUS, in Roman antiquity, an officer in the armories, who had the care of the helmets.

CASSIDONY. See Gnaphalium.

CASSINA, or Cashna, a kingdom of central Africa, first described by Mr. Lucas as situated to the west of Bornou, and south of the Niger. It appears to rank next to Bornou in importance among the kingdoms of the interior; but its geographical and political features are too little known for us to offer any detailed statement of them. Cassina is said to form the southern limit of Fezzan, from which it is separated by the mountains of Eyre, so that it includes Agades and the surrounding regions; it resembles Bornou in its general appearance and productions, government, &c. Its commerce with northern Africa is maintained by a caravan which sets out from Fezzan, by Assouda, Ganatt, and Agades,

ticle, such as those of infusion, powder,
e, and electuary. The dose of senna in
ace, is from a scruple to a drachm: in
n, from one to three or four drachms. It
en customary to reject the pedicles of the
of senna as of little or no use: Geofroy
er observes, that they are not much infe-
efficacy to the leaves themselves. The
r seed-vessels are by the college of Brus-
eferred to the leaves: they are less apt to
but proportionably less purgative.

ASSINA, or Cashna, a kingdom of central
a, first described by Mr. Lucas as situated to
vest of Bornou, and south of the Niger. It
ars to rank next to Bornou in importance
g the kingdoms of the interior; but its geo-
hical and political features are too little
n for us to offer any detailed statement of
. Cassina is said to form the southern limit
rzan, from which it is separated by the
ntains of Eyre, so that it includes Agades
the surrounding regions; it resembles Bor-
in its general appearance and productions,
rnment, &c. Its commerce with northern
maintained by a caravan which sets out
by Assouda, Ganatt, and Agades,

and arrives at the capital in about sixty days: a journey of five days is now said to bring it to the Niger. The exports consist of slaves, gold-dust, cotton, and red and yellow goat skins. The imports are woollen stuffs, hardware, carpets, knives, arms, mirrors, and toys. The currency is in small shells, called cowries, 5000 of which are worth about £1 sterling.

CASSINE, in botany, a genus of the trigynia order and pentandria class of plants; natural order twenty-third, dumosæ: cal. quinquepartite; the petals are five; and the fruit is a trispermous berry. There are four species, all of them natives of warm climates.

CASSINIAN Curve, or Cassinoid, in astronomy, is an elliptic curve proposed by John Dominic Cassini, as the orbit of a planet. In this curve the product of two lines drawn from its foci to any point in the curve shall be equal to a given quantity, viz. to the rectangle under the aphelion and perihelion distances of the planet. The celestial observations, however, by no means correspond with this curve; and indeed it in some cases has breaches in its continuation, which are perfectly incompatible with the motion of a planet; so that it can by no means be admitted into astronomy. See *Dr. O. Gregory's Astronomy*, p. 183.

CASSINI (John Dominic), an eminent astronomer, born at Piedmont in 1635. His early proficiency in astronomy procured him an invitation to the mathematical chair at Bologna when he was only fifteen years of age: and, a comet appearing in 1652, he first asserted the regularity of the orbits of those bodies. In the same year he solved a problem given up by Kepler and Bullialdus, which was to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1653 he drew his famous meridian line at Bologna, which is described by lady Morgan in her account of a visit to that city in 1820, as occupying an extent of 206 French feet, and making, as the inscription indicates, the 600,000th part of the earth's circumference. The gnomon or hole by which the sun's rays enter, is eighty-three feet in height above the pavement. This instrument marks the distance from the zenith, the sun's passage through the signs of the zodiac, the hours of the night, and other astronomical facts. In 1663 he was appointed inspector general of the fortifications of Urbino, and superintendent of all the rivers in the ecclesiastical state: he still however prosecuted his astronomical studies, and discovered the revolution of Mars round his own axis. In 1666 he published his Theory of Jupiter's Satellites. Cassini was invited into France by Louis XIV. in 1669, where he settled as first professor in the royal observatory. In 1677 he demonstrated the line of Jupiter's diurnal rotation; and in 1684 discovered four more satellites belonging to Saturn, Huygens having observed one before. In 1695 he went to Italy to inspect the meridian line, which he had settled in 1653, and in 1700 he continued the meridian line of France, which had been begun by Picard. He inhabited the royal observatory at Paris more than forty years; and died in 1712, having lost his sight some years before.

Cassini (James), the son of the preceding, was born at Paris, in 1677. He was educated at the Mazarine College under Varignon, professor of mathematics; and when only seventeen years of age admitted a member of the Academy. In 1696 he visited England, and was there chosen a fellow of the Royal Society. In 1712 he succeeded his father in the royal observatory at Paris, and increased the stock of science by numerous discoveries. But having, in 1720, published a book on the figure of the earth, maintaining, in opposition to Newton, that it was an oblong spheroid, the French king sent two companies of mathematicians, one towards the polar circle, and the other to the equator, to measure a degree; a decided refutation of Cassini's opinion was the result. In 1723 he described a perpendicular to the meridian of France, from Paris to St. Malo, and in 1724 from Paris to Strasburgh. In 1740 he published Elements of Astronomy, with Astronomical Tables. He died in 1756.

Cassini De Thury (Cæsar François), son of the above, was born at Paris, in 1714. When ten years of age he calculated the phases of the solar eclipse of 1727. He succeeded his father, and employed himself for many years in perfecting a general chart of France, and in continuing the perpendicular of the meridian of Paris. He wrote a great number of papers, published in the Memoirs of the Academy of Sciences. He died in 1784.

CASSI'NO, *n.* A game at cards, in which four are dealt to each player, four being also placed on the board. His object is to take as many cards as possible, by making combinations. Thus, a ten in his hand will take a ten from the board, or any number of cards which can be made to combine into tens. The greatest number of cards reckons three points; and of spades, one; the ten of diamonds, two; the two of spades one; and each of the aces, one.

CASSIODORUS (Marcus Aurelius), secretary of state to Theodoric king of the Goths, was born at Squillace, in Naples, about A. D. 481 He was also appointed governor of Sicily by the same prince; and in 514 was raised to the dignity of consul, in which Athalaric continued him, but Vitiges deprived him of all his offices. Perceiving the fall of the Gothic kingdom, and tired of the troubles of a public station, he resolved to retire from the world, and accordingly went to his native place, Squillace, where, having built a hermitage and a monastery, he devoted himself to his studies and religion. Here also he amused himself in making sun-dials, clepsydræ, and perpetual lamps. He died about 577. He wrote a Chronology from the beginning of the world to the year 519; a History of the Goths, of which an abridgment only remains; Letters, written while secretary, yet extant and valuable; a Treatise on Orthography; and Commentaries on several Passages of Scripture; of the latter those most esteemed are his Divine Institutions, and his Treatise on the Soul. The best edition of his works is that of Father Garret, printed at Rouen in 1679.

CASSIOPEIA, in astronomy, one of the constellations of the northern hemisphere, situated next to Cepheus. In 1572 there appeared a new star in this constellation, which at first surpassed in magnitude and brightness Jupiter himself; but it diminished by degrees, and at last disappeared, at the end of eighteen months. It astonished all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus. This constellation contains fifty-two stars of the first six magnitudes.

CASSIOPEIA, in fabulous history, wife to Cepheus, king of Ethiopia, and mother of Andromeda. She boasted that she was more beautiful than the Nereides, who desired Neptune to revenge the affront, on which he sent a sea-monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus, who obtained of Jupiter that Cassiopeia might be placed after her death among the stars: hence the constellation of that name.

CASSIOWARY. See STRUTHIO.

CASSIS, in antiquity, a plated or metalline helmet; different from the galea, which was of leather.

CASSITERIA, from *κασσιτερος*, tin, in the natural history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin. The cassiteria are of two kinds; the whitish pellucid cassiterion, and the brown. The first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid. The brown cassiterion is like the former in figure; it is of a very smooth and glossy surface. They are found chiefly in Devonshire and Cornwall.

CASSITERIDES, in ancient geography, a cluster of islands west of the Land's End, opposite to Celtiberia, and famous for their tin. They were formerly open to none but Phœnicians, who carried on this commerce from Gades, concealing the navigation from the rest of the world. They are supposed to be the present Scilly Islands.

CASSIUS (Longinus Caius), one of the conspirators against Cæsar. He was married to Junia, the sister of Marcus Brutus. After his defeat at Philippi, he ordered one of his freed men to put him to death with his own sword, A. A. C. 41. See ROME.

CAS'SOCK, *n.* Fr. *casaque;* Ital. *casacca;* Sp. *casaca;* Gr. *kausak;* Dutch, *kazack;* Dan. *kasjack;* Swed. *kasjacka;* Arm. *keseg;* Welsh, *casog.* This word was formerly applied to a part of the upper dress of a soldier, as is shown by the quotation from Shakspeare; but it is now confined to a garment worn by clergymen.

And now the fox had gotten him a goune,
And the ape a *cassocke*, sidelong hanging doune;
For they their occupation meant to change,
And now in other state abroad to range.
Spenser. Mother Hubbard's Tale.

Half dare not shake the snow from off their *cassocks*,
They shake themselves to pieces. *Shakspeare.*

His scanty salary compelled him to run deep in debt for a new gown and *cassock*, and now and then forced him to write some paper of wit or humour, or preach a sermon for ten shillings, to supply his necessities. *Swift.*

CASSONADE, in commerce, cask sugar, or sugar put into casks after the first purification, but which has not been refined. It is sold either in powder or in lumps; the whitest, and that of which the lumps are largest, is the best. Many imagine it sweetens more than loaf-sugar, but it is certain that it yields a great deal more scum.

CASSOWARY. See STRUTHIO.

CASSWEED, in botany. See THLASPI.

CASSYTA, in botany, a genus of the monogynia order, and enneandria class of plants: CAL. none; COR. in the form of a calyx, divided into six segments; the nectarium is composed of three truncated glands encompassing the germen; the interior filaments are glandular; and the drupe contains a single seed. There are but two species, both Indian species.

CAST, *v.* & *n.* CAST'-AWAY, *n.* & *adj.* CAS'TER, *n.* CAS'TING, *n.* CAS'TING-NET, *n.* CAS'TLING, *n.*	Goth. *kasta;* Dan. *kast;* Swed. *kasta.* This, as Johnson justly observes, is a word of multifarious and indefinite use; as,

independently of the significations which it has when it stands by itself, it acquires numerous others from being united with prepositions. In order, therefore, to show the full power of it, we shall adopt his arrangement, with the addition of some authorities, and shades of meaning.

CAST, *v. a.* To throw with the hand.

I rather chuse to endure the wounds of those darts, which envy *casteth* at novelty, than to go on safely and sleepily in the easy ways of ancient mistakings. *Raleigh.*

Then *cast* thy sword away,
And yield thee to my mercy, or I strike
Dryden and Lee.

Cast on the bank he dies with gasping pains,
And trickling blood his silver mail distains. *Gay.*

To throw away, as useless or noxious.

If thy right hand offend thee, cut it off, and *cast* it from thee. *Matthew.*

To throw as from an engine.

Slings to *cast* stones. *Chronicles.*

To scatter by the hand: as, to *cast* seed.

Cast the dust into the brook. *Deuteronomy.*

Nor that she pays while she survives
To her dead love this tribute due,
But *casts* abroad those donatives
At the installing of a new. *Marvell.*

To force by violence.

Cast them into the Red Sea. *Exodus.*

To shed.

Nor shall your vine *cast* her fruit. *Malachy.*

To throw from a high place.

Bear him to the rock Tarpeian, and from thence
Into destruction *cast* him. *Shakspeare. Coriolanus.*

To throw as a net or snare.

I speak for your own profit, not that I may *cast* a snare upon you. 1 *Cor.* vii. 35.

To drop; to let fall.

They let down the boat into the sea, as though they would have *cast* anchor. *Acts,* xxvii. 30.

For Santa Cruz the glad fleet takes her way,
And safely there *casts* anchor in the bay. *Marvell.*

To throw dice or lots.

And Joshua *cast* lots for them in Shiloh. *Joshua*, xviii. 10.

To throw in wrestling.

And I think, being too strong for him, though he took my legs sometime, yet I made a shift to *cast* him. *Shakspeare.*

To throw, as worthless or hateful.

His carcase was *cast* in the way. *Chronicles.*

To drive by violence of weather.

Howbeit we must be *cast* upon a certain island. *Acts.*

What length of lands, what ocean have you passed,
What storms sustained, and on what shore been *cast?* *Dryden.*

To emit.

This fumes off in the calcination of the stone, and *casts* a sulphureous smell. *Woodward.*

To bring suddenly or unexpectedly.

Content themselves with that which was the irremediable error of former time, or the necessity of the present hath *cast* upon them. *Hooker.*

To build by throwing up earth; to raise.

And shooting in the earth *casts* up a mount of clay. *Spenser's Faerie Queene.*

Earth-worms will come forth, and moles will *cast* up more, and fleas bite more, against rain. *Bacon's Nat. Hist.*

To put into or out of any certain state, with the notion of descent or depression: as, the king was *cast* from his throne.

Jesus had heard that John was *cast* into prison. *Matthew.*

To condemn in a criminal trial.

But oh, that treacherous breast! to whom weak you
Did trust our counsels, and we both may rue,
Having his falsehood found too late, 'twas he
That made me *cast* you guilty, and you me. *Donne.*

There then we met; both tried and both were *cast*;
And this irrevocable sentence past. *Dryden.*

To overcome or defeat in a law suit; from Fr. *caster.*

The northern men were agreed, and in effect all the other, to *cast* our London escheatour. *Camden's Remains.*

To defeat.

No martial project to surprise,
Can ever be attempted twice;
Nor *cast* design serve afterwards,
As gamesters tear their losing cards. *Hudibras.*

To cashier.

You are but now *cast* in his mood, a punishment more in policy than in malice; even so as one would beat his offenceless dog, to affright an imperious lion. *Shakspeare.*

To leave behind in a race.

In short, so swift your judgments turn and wind,
You *cast* your fleetest wits a mile behind. *Dryden.*

To shed, to let fall; to lay aside; to moult; to change for new.

The *casting* of the skin is, by the ancients, compared to the breaking of the secundine, or cawl, but not rightly; for that were to make every *casting* of the skin a new birth: and besides, the secundine is but a general cover, not shaped according to the parts, but the skin is shaped according to the parts. The creatures that *cast* the skin, are the snake, the viper, the grasshopper, the lizard, the silkworm, &c. *Bacon.*

The waving harvest bends beneath his blast,
The forest shakes, the groves their honours *cast.* *Dryden.*

The ladies have been in a kind of moulting season, having *cast* great quantities of ribbon and cambrick and reduced the human figure to the beautiful globular form. *Addison.*

To lay aside, as fit to be used or worn no longer.

So may *cast* poets write; there's no pretension
To argue loss of wit, from loss of pension. *Dryden.*

He has ever been of opinion, that giving *cast* clothes to be worn by valets, has a very ill effect upon little minds. *Addison.*

To have abortions; to bring forth before the time.

Thy ewes and thy she-goats have not *cast* their young. *Genesis.*

To make to preponderate; to decide by overbalancing; to give over-weight.

Which being inclined, not constrained, contain within themselves the *casting* act, and a power to command the conclusion. *Browne's Vulgar Errours.*

How much interest *casts* the balance in cases dubious. *South.*

Not many years ago, it so happened, that a cobler had the *casting* vote for the life of a criminal, which he very graciously gave on the merciful side. *Addison on Italy.*

To compute; to reckon; to calculate.

Hearts, tongues, figures, scribes, bards, poets, cannot
Think, speak, *cast*, write, sing, number, ho!
His love to Antony. *Shakspeare.*

You *cast* the event of war, my noble lord,
And summed the account of chance, before you said,
Let us make head. *Id.*

I have lately been *casting* in my thoughts the several unhappinesses of life, and comparing the infelicities of old age to those of infancy. *Addison.*

To contrive; to plan out.

The cloister facing the south is covered with vines, and would have been proper for an orange-house; and had, I doubt not, been *cast* for that purpose, if this piece of gardening had been then in as much vogue as it is now. *Temple.*

To judge; to consider in order to judgment.

If thou couldst, doctor, *cast*
The water of my land, find her disease,
And purge it to a sound and pristine health,
I would applaud thee. *Shakspeare.*

Peace, brother, be not over exquisite
To *cast* the fashion of uncertain evils. *Milton.*

To fix the parts in a play.

Our parts in the other world will be new *cast*, and mankind will be there ranged in different stations of superiority. *Addison.*

To glance; to direct: applied to the eye or mind.

Beryn rode forth in his wey, his page ran him by,
Full sore adred in hert, and *cast* about his eye
Up and down, even long the strete, and for his anger
swete. *Chaucer. Cant. Tales.*

A losel wandering by the way,
One that to bounty never *cast* his mind
Ne thought of heaven ever did assay
His baser breast. *Spenser.*

Zelmane's languishing countenance, with crossed arms, and sometimes *cast* up eyes, she thought to have an excellent grace. *Sidney.*

Begin, auspicious boy, to *cast* about
Thy infant eyes, and, with a smile, thy mother single
out. *Dryden's Virgil.*

Far eastward *cast* thine eye, from whence the sun,
And orient science, at a birth begun. *Pope's Dunciad.*

Quick to the neighbouring tree he flies,
There, trembling, *casts* around his eyes;
No foe appears, his fears were vain,
Pleased he renews the sprightly strain. *Beattie.*

You cannot behold a covetous spirit walk by a goldsmith's shop without *casting* a wishful eye at the heaps upon the counter. *Spectator.*

To found; to form by running in a mould; to melt metal into figures.

When any such curious work of silver is to be *cast*, as requires that the impression of hairs, or very slender lines, be taken off by the metal, it is not enough that the silver be barely melted, but it must be kept a considerable while in a strong fusion. *Boyle.*

The father's grief restrained his art;
He twice essay'd to *cast* his son in gold,
Twice from his hands he dropped the forming mould.
Dryden.

To model; to form by rule.

Under this influence, derived from mathematical studies, some have been tempted to *cast* all their logical, their metaphysical, and their theological and moral learning into this method. *Watts's Logic.*

To communicate by reflection or emanation.

So bright a splendour, so divine a grace,
The glorious Daphnis *casts* on his illustrious race.
Dryden.

To yield or give up, without reserve or condition.

The reason of mankind cannot suggest any solid ground of satisfaction, but in making God our friend, and in carrying a conscience so clear, as may encourage us, with confidence, to *cast* ourselves upon him. *South.*

To inflict, or throw.

The world is apt to *cast* great blame on those who have an indifferency for opinions, especially in religion. *Locke.*

To cast aside. To dismiss as useless or inconvenient.

I have bought
Golden opinions from all sort of people,
Which would be worn now in their newest gloss,
Not *cast* aside so soon, *Shakspeare.*

To cast away. To shipwreck.

Sir Francis Drake and John Thomas, meeting with a storm, it thrust John Thomas upon the islands to the south, where he was *cast* away. *Raleigh's Essays.*

'Twas in a shipwreck, when the seas
Ruled, and the winds did what they please,
That my poor lover floating lay,
And ere brought forth, was *cast away*. *Marvell.*

But now our fears tempestuous grow,
And *cast* our hopes *away*;
Whilst you, regardless of our woe,
Sit careless at a play. *Dorset.*

To cast away. To lavish; to waste in profusion; to turn to no use.

They that want means to nourish children, will abstain from marriage; or, which is all one, they *cast away* their bodies upon rich old women.
Raleigh's Essays.

O Marcia, O my sister! still there's hope,
Our father will not *cast away* a life
So needful to us all, and to his country.
Addison's Cato.

To cast away. To ruin.

It is no impossible thing for states, by an oversight in some one act or treaty between them and their potent opposites, utterly to *cast away* themselves for ever. *Hooker.*

To cast away. To dismiss; to drive away.

Hang sorrow! let's to yonder hut repair,
And with trim sonnets *cast away* our care. *Gay.*

To cast back. To render tardy; to put behind.

Your younger feet; while mine, *cast back* with age,
Come lagging after. *Milton.*

To cast by. To reject or dismiss, with neglect or hate.

Old Capulet and Montagu,
Have made Verona's ancient citizens
Cast by their grave beseeming ornaments.
Shakspeare.

When men, presuming themselves to be the only masters of right reason, *cast by* the votes and opinions of the rest of mankind, as not worthy of reckoning.
Locke.

To cast down. To deject; to depress the mind.

We're not the first,
Who, with best meaning, have incurred the worst:
For thee, oppressed king, I am *cast down*;
Myself could else outfrown false fortune's frown.
Shakspeare.

The best way will be to let him see you are much *cast down*, and afflicted, for the ill opinion he entertains of you. *Addison.*

To cast forth. To emit.

He shall grow as the lily, and *cast forth* his roots as Lebanon. *Hosea.*

To cast forth. To eject.

They *cast* me *forth* into the sea. *Jonah*

To cast off. To discard; to put away.

The prince will, in the perfectness of time,
Cast off his followers. *Shakspeare.*

He led me on to mightiest deeds,
But now hath *cast* me *off*, as never known.
Milton.

How! not call him father? I see preferment alters a man strangely; this may serve me for an use of instruction, to *cast off* my father, when I am great.
Dryden.

To cast off. To reject.

It is not to be imagined, that a whole society of men should publicly and professedly disown and *cast off* a rule, which they could not but be infallibly certain was a law. *Locke.*

To cast off. To disburden one's self of.

All conspired in one to *cast off* their subjection to the crown of England. *Spenser's State of Ireland.*

The true reason why any man is an atheist, is because he is a wicked man: religion would curb him in his lusts; and therefore he *casts* it *off*, and puts all the scorn upon it he can. *Tillotson.*

To cast off. To leave behind.

Away he scours cross the fields, *casts off* the dogs, and gains a wood: but pressing through a thicket, the bushes held him by the horns, till the hounds came in, and plucked him down. *L'Estrange.*

O Marcia, O my sister! still there's hope,
Our father will not *cast away* a life
So needful to us all, and to his country.
Addison's Cato.

To cast away. To ruin.

It is no impossible thing for states, by an oversight
a some one act or treaty between them and their p-
nt opposites, utterly to *cast away* themselves for
ver. *Hooker.*

To cast away. To dismiss; to drive away.

Hang sorrow! let's to yonder hut repair,
And with trim sonnets *cast away* our care. *Gay.*

To cast back. To render tardy; to put be-
ind.

Your younger feet; while mine, *cast back* with age,
ome lagging after. *Milton.*

To cast by. To reject or dismiss, with neg-
ct or hate.

Old Capulet and Montagu,
Have made Verona's ancient citizens
Cast by their grave beseeming ornaments.
Shakspeare.

When men, presuming themselves to be the only
asters of right reason, *cast by* the votes and opinions
the rest of mankind, as not worthy of reckoning.
Locke.

To cast down. To deject; to depress the
nd.

We're not the first,
Who, with best meaning, have incurred the worst:
For thee, oppressed king, I am *cast down*;
Myself could else outfrown false fortune's frown.
Shakspeare.

The best way will be to let him see you are much
t down, and afflicted, for the ill opinion he enter-
is of you. *Addison.*

To cast forth. To emit.

He shall grow as the lily, and *cast forth* his roots
Lebanon. *Hosea.*

To cast forth. To eject.

They *cast* me *forth* into the sea. *Jonah*

To cast off. To discard; to put away.

The prince will, in the perfectness of time,
Cast off his followers. *Shakspeare.*

He led me on to mightiest deeds,
But now hath *cast me off*, as never known.
Milton.

ow! not call him father? I see preferment alters
in strangely; this may serve me for an use of in-
tion, to *cast off* my father, when I am great.
Dryden.

To cast off. To reject.

is not to be imagined, that a whole society of
should publicly and professedly disown and cast
rule, which they could not but be infallibly cer-
as a law. *Locke.*

cast off. To disburden one's self of.

conspired in one to *cast off* their subjection to
own of England. *Spenser's State of Ireland.*

true reason why any man is an atheist, is be
he is a wicked man: religion would curb him
lusts; and therefore he *casts it off*, and puts all
orn upon it he can. *Tillotson*

cast off. To leave behind.

ay he scours cross the fields, *casts off* the dogs,
ins a wood: but pressing through a thicket, the
held him by the horns, till the hounds came
d plucked him down. *L'Estrange.*

To cast off. A hunting term. To let go or set free: as, to cast off the dogs.

To cast out. To reject; to turn out of doors.

Thy brat hath been *cast out*, like to itself, no father owning it. *Shakspeare.*

To cast out. To vent; to speak: with some intimation of negligence or vehemence.

Why dost thou *cast out* such ungenerous terms
Against the lords and sovereigns of the world?
Addison.

To cast up. To compute; to calculate.

Some writers, in *casting up* the goods most desirable in life, have given them this, rank, health, beauty, and riches. *Temple.*

To cast up. To vomit.

Thou, beastly feeder, art so full of him,
That thou provokest thyself to *cast* him *up*. *Shak.*
Thy foolish errour find;
Cast up the poison that infects thy mind. *Dryden.*

To cast up. To throw or lift up.

Cast up the curtein, loke how that it is.
Chaucer's Cant. Tales.

To cast upon. To refer to; to resign to.

If things were *cast upon* this issue, that God should never prevent sin till man deserved it, the best would sin and sin for ever. *South.*

To Cast. *v. n.*

To contrive; to turn the thoughts.

Then, closely as he might, he *cast* to leave
The court, not asking any pass or leave. *Spenser.*
But first he *casts* to change his proper shape,
Which else might work him danger or delay:
And now a stripling cherub he appears. *Milton.*

To admit of a form, by casting or melting.

It comes at the first fusion into a mass that is immediately malleable, and will not run thin, so as to *cast* and mould, unless mixed with poorer ore, or cinders. *Woodward on Fossils.*

To be formed as if in a mould.

These features *cast* in heavenly mould
Shall like my coarser earth grow old;
Like common grass, the fairest flower
Must feel the hoary season's power. *Gay.*

To warp; to grow out of form.

Stuff is said to *cast* or warp, when, by its own drought, or moisture of the air, or other accident, it alters its flatness or straightness.
Moxon's Mechanical Exercises.

To vomit.

I cannot abide them, they make me ready to *cast*.
B. Jonson.

To cast about. To contrive; to look for means.

We have three that bend themselves, looking into the experiments of their fellows, and *cast about* how to draw out of them things of use and practice for man's life and knowledge. *Bacon's New Atalantis.*

As a fox, with hot pursuit
Chased thro' a warren, *cast about*
To save his credit. *Hudibras.*

All events called casual, among inanimate bodies, are mechanically produced according to the determinate figures, textures, and motions of those bodies, which are not conscious of their own operations, nor contrive and *cast about* how to bring such events to pass. *Bentley.*

To cast about; to retrace the steps.

The people that Ishmael had carried away captive from Mispeth *cast about* and returned, and went to Johanan. *Jeremiah* xli. 14.

Cast, *n.*

The act of casting or throwing; a throw.

So when a sort of lusty shepherds throw
The bar by turns, and none the rest outgo
So far, but that the rest are measuring *casts*,
Their emulation and their pastime lasts. *Waller.*

The thing thrown.

Yet all these dreadful deeds, this deadly fray,
A *cast* of dreadful dust will soon allay,
Dryden's Virgil.

State of anything cast or thrown.

Plato compares life to a game at tables; there what *cast* we shall have is not in our power; but to manage it well, that is. *Norris.*

Manner of throwing.

Some harrow their ground over, and sow wheat or rye on it with a broad *cast*; some only with a single *cast*, and some with a double. *Mortimer.*

The space through which anything is thrown.

And he was withdrawn from them about a stone's *cast*, and kneeled down and prayed. *Luke.*

And ere he had riden a stone's *cast*, a blynd man
with him met,
And spak no word, but sesed him fast by the lap,
And cried 'out and harowe,' and nere him gan to stap.
Chaucer's Cant. Tales.

A stroke; a touch.

We have them all with one voice for giving him a *cast* of their court prophecy. *South*

This was a *cast* of Wood's politics; for his information was wholly false and groundless. *Swift.*

Motion of the eye; direction of the eye.

Pity causeth sometimes tears, and a flexion or *cast* of the eye aside; for pity is but grief in another's behalf; the *cast* of the eye is a gesture of aversion, or lothness, to behold the object of pity.
Bacon's Nat. History.

There, held in holy passion still
Forget thyself to marble, till
With a sad leaden, downward *cast*,
Thou fix them on the earth as fast. *Milton.*

He that squints is said popularly to have a *cast* with his eye.

A man shall be sure to have a *cast* of their eye to warn him, before they give him a *cast* of their nature to betray him. *South.*

The throw of dice.

Were it good,
To set the exact wealth of all our states
All at one *cast*; to set so rich a main
On the nice hazard of some doubtful hour?
Shakspeare.

Venture from throwing dice; chance from the fall of dice.

When you have brought them to the very last *cast*, they will offer to come to you, and submit themselves
Spenser on Ireland.

With better grace an ancient chief may yield
The long contested honours of the field,
Than venture all his fortune at a *cast*,
And fight, like Hannibal, to lose at last. *Dryden.*

A mould; a form.

The whole would have been an heroic poem, but in another *cast* and figure than any that ever had been written before. *Prior.*

The act of casting metal.

Such daily *cast* of brazen cannon. *Shakspeare.*

A shade or tendency to any color.

The qualities of blood in a healthy state are to be florid, the red part congealing, and the serum ought be without any greenish *cast*. *Arbuthnot on Aliments.*

Exterior appearance.

The native hue of resolution
Is sicklied o'er with the pale *cast* of thought. *Shakspeare.*

Manner; air; mein.

Pretty conceptions, fine metaphors, glittering expressions, and something of a neat *cast* of verse, are properly the dress, gems, or loose ornaments of poetry. *Pope's Letters.*

A flight; a number of hawks dismissed from the fist.

A *cast* of merlins there was besides, which, flying off a gallant height, would beat the birds that rose down unto the bushes, as falcons will do wild fowl over a river. *Sidney.*

Cast; from the Welsh; a trick.

CA'STA. Span. a breed; a race; a species.

CASTAGNO (Andrew Del), historical painter, was born at Castagno, in 1409, and was originally employed in tending cattle; but, having accidentally seen an ordinary painter at work, he made such efforts to imitate him, as astonished all who saw his productions. The genius of Andrew became at last a common topic of discourse in Florence, and excited the curiosity of Bernardetto de Medici so far that he sent for him, and perceiving that he had promising talents, placed him under the care of the best masters then in Florence. He painted only in distemper and fresco, with a manner of coloring that was not very agreeable, till he learned the art of painting in oil from Dominic Venetiano, who had derived his knowledge of that discovery from Antonello da Messina. Being less admired than Venetiano, he formed the horrid resolution of assassinating his friend and benefactor, and stabbed him at the corner of a street so secretly, that he escaped unobserved and unsuspected to his own house. Thither Dominic was soon after conveyed, to die in the arms of his murderer. No discovery of this inhuman transaction was made till Andrew, through remorse of conscience, confessed it on his death-bed, in 1480. He finished several considerable works at Florence, by which he gained great reputation. His most noted picture was lately in the hall of justice at Florence, representing the execution of the conspirators against the house of Medici.

CASTALIO (Sebastian), was born in the province of Dauphiny in 1515. Calvin, during his stay at Strasburgh in 1540 and 1541, procured him a regent's place in the college of Geneva; but after continuing in this office nearly three years, Castalio was forced to quit it in 1544, on account of his opinions. See Calvin. He retired to Basil, where he was made Greek professor, and died in 1564, aged forty-eight. His works are very considerable. In 1545 he printed, in elegant Latin, at Basil, Dialogorum Sacrorum, Libri IV., a work containing the principal histories of the Bible thrown into the form of dialogues. But his principal work is a Latin and French translation of the Scriptures. He began the Latin translation at Geneva in 1542, and finished it at Basil in 1550. It was printed at Basil, in 1551, and dedicated to Edward VI. king of England. The French version was dedicated to Henry II. of France, and printed at Basil, in 1555.

CASTALIUS Fons, Castalia, a fountain at the foot of mount Parnassus, in Phocis, near the temple of Apollo, or near Delphi; sacred to the Muses. Its murmurs were thought prophetic.

CAS'TANET, *n.* Fr. *castagnettes;* Span. *castanéta.* Castanéta is a diminutive of castana, a chestnut; and the name is supposed to be given to the instrument either from its being made of chestnut wood, or from its resemblance to the shell of a chestnut. Two small pieces of hollow ivory, or hard wood, which dancers rattle in their hands, in cadence to their motions.

If there had been words enow between them, to have expressed provocation, they had gone together by the ears like a pair of *castanets.* *Congreve.*

Castanets, Castanettas, or Castagnettes, are a kind of musical instrument, with which the Moors, Spaniards, and Bohemians accompany their dances, sarabands, and guitars. It consists of two little round pieces of wood dried, and hollowed in the manner of a spoon, the concavities whereof are placed one on another, fastened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The castanets may be beat eight or nine times in a second.

CAST'AWAY, *n.* & *adj.* A person abandoned by Providence; anything thrown away; useless; valueless.

Lest that by any means, when I have preached to others, I myself should be a *castaway.* 1 *Cor.* ix. 27.

Neither given any leave to search in particular who are the heirs of the kingdom of God, who *castaways.* *Hooker.*

We only prise, pamper, and exalt this vassal and slave of death; or only remember, at our *castaway* leisure, the imprisoned immortal soul. *Raleigh.*

CASTE, in the eastern affairs, is used in a sense somewhat similar to Dr. Johnson's definition for a tribe, or number of families, of the same rank and profession. The division of a nation into castes chiefly obtains in the dominions formerly belonging to the Great Mogul, Bengal, the island ot Ceylon, and the great peninsula opposite. See Brahmin and Hindostan.

CAST'ED. The participle preterite of cast, but improperly, and found perhaps only in the following passage.

When the mind is quickened, out of doubt,
The organs, though defunct and dead before,
Break up their drowsy grave, and newly move
With *casted* slough and fresh legerity. *Shakspeare.*

CASTEL (Lewis Bertrand), a learned Jesuit, born at Montpelier in 1688. He distinguished himself by writing on gravity, mathematics, and the music of colors, a whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled Traité de la Pensateur Universelle, was printed at Paris in 1724. He afterwards published his Mathematique Universelle, which occasioned his being unanimously chosen F.R.S. of London. He was also a member of the academies of Bourdeaux and Rouen: but his Clavecin Oculaire excited most

nished it at Basil in 1550. It was printed
Basil, in 1551, and dedicated to Edward VI.
ng of England. The French version was de-
cated to Henry II. of France, and printed at
asil, in 1555.

T'ED. The participle preterite of cast,
roperly, and found perhaps only in the
g passage.
en the mind is quickened, out of doubt,
gans, though defunct and dead before,
up their drowsy grave, and newly move
asted slough and fresh legerity. Shakspeare.
EL (Lewis Bertrand), a learned Jesuit,
Montpelier in 1688. He distinguished
y writing on gravity, mathematics, and
c of colors, a whimsical idea, which he
eat pains to reduce to practice. His
gravity, entitled Traité de la Pesanteur
lle, was printed at Paris in 1724. He
s published his Mathematique Univer-
ich occasioned his being unanimously
F. R. S. of London. He was also a
of the academies of Bourdeaux and
but his Clavecin Oculaire excited more

attention; and he spent much time and expense in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, Le Plan d'une Mathematique Abregée, and a treatise entitled Optique des Couleurs. He led a very exemplary life, and died in 1757.

CASTELL (Edmund), D. D., a learned English divine of the seventeenth century, distinguished by his skill in the eastern languages. He was educated at Cambridge; where he was master of Catharine hall, Arabic professor, and canon of Canterbury. He was also chaplain to Charles II. He had a great share in the labor of printing the Polyglott Bible of London; and wrote the Heptaglotton pro Septem Orientalibus, &c. On this excellent work, which occupied a great part of his life, he bestowed incredible pains and expense, even to the breaking of his constitution, and exhausting of his fortune. It is said he expended no less than £12,000 upon it.. At length, when it was printed, the copies remained unsold upon his hands. He died in 1685, and bequeathed all his oriental MSS. to the university of Cambridge, on condition that his name should be written on every copy in the collection.

CASTELLA, a town of Italy, about five miles north-east of Mantua, where an obstinate battle was fought between the French and Austrians, on the 12th of September, 1796, when the former were defeated.

CASTELLATIO, or CASTELLATION, in middle age writers, the act of building a castle, or of fortifying a house, and making it a castle. By the ancient English laws, castellation was prohibited, without the king's especial license.

CASTELLI (Bernard), an eminent painter, born at Genoa in 1557. He excelled in coloring and in portraits. He was the intimate friend of Tasso, and designed and etched the figures of his Hierosolyma Liberata. He died at Genoa in 1629.

CASTELLO, CITTA DI (the Tifernum Tiberinum of the ancients), a bishop's see in the province of Umbria, and States of the Church, on the Tiber, the capital of a county of the same name. It is well fortified, has a castle, and contains ten churches.

CASTELLO ROSSO, or KASTELORIZO, a small island of the Mediterranean, divided from the coast of Caramania by a channel, about half a mile wide. It is rocky and high, the summit rising about 800 feet above the ocean. There is a town of this name on it, with a good small harbour. It is principally inhabited by Greeks, under the government of a Turkish aga, dependent on the bey of Rhodes. Long. 29° 37′ E., lat. 39° 8′ N.

CASTELLON DE LA PLANA, a large town in a very fertile part of Valencia, Spain, about half a league from the coast of the Mediterranean. The Moorish walls and towers are in tolerable repair. It has eight gates and two suburbs. The streets are generally broad, and the houses well-built. A spacious square contains the town-house and principal church. The only objects of interest are the church buildings, the town-house, and a vast tower or belfry, 260 feet in height, and 161 in circumference. Population 11,000. Twenty-eight miles south of Valencia.

CASTELNAUDARY, or CHATEL-NAUDARY, a silk manufacturing town of Upper Languedoc, France, in the department of the Aude. It stands on an eminence near the canal of Languedoc. The country around is fertile in corn. Here is a collegiate chapter, and in the vicinity the grand reservoir which supplies the canal with water. A battle was fought here in 1632, between the duke of Montmorency and marshal Schomberg, in which the former was defeated and made prisoner. Thirty-three miles south-east of Toulouse, and 460 south of Paris.

CASTELLUM, Lat. i. e. a little castle, originally seems to have signified a small fort for a little garrison: though Suetonius uses the word where the fortification was large enough to contain a cohort. The castella, according to Vegetius, were often like towns, built on the borders of the empire, and where there were constant guards, and fences against the enemy. Horsley takes them for much the same with stations.

CAST'ER, *v.* & *n.* A thrower; he who casts; an accomptant; a man who calculates nativities. The noun signifies a small wheel, fixed to a swivel such as tables move on.

If with this throw the strongest *caster* vie,
Still, further still, I bid the discus fly. *Pope.*

Did any of them set up for a *caster* of fortunate figures, what might he not get by his predictions? *Addison.*

CASTIFICA'TION. Lat. *castus* and *facio* Chastity. The word is used in his sense by Bishop Taylor, but I know of no other authority for it.

CA'STIGATE, *v.*
CASTIGA'TION, *n.*
CA'STIGATOR, *n.*
CA'STIGATORY, *adj.*

Ital. *castigare;* Span. *castigar;* Lat. *castigo.* To castigate, is to inflict chastisement, or punishment; to correct; to render pure; castigation is the punishment, correction, penance, or discipline, which is suffered; the emendations, or purifications which are made; the castigator is the agent in these operations; and castigatory signifies punitive, for the purpose of amending.

If thou didst put this sour cold habit on
To *castigate* thy pride, 'twere well. *Shakspeare.*
This band of your's requires
A sequester from liberty, fasting and prayer,
With *castigation*, exercise devout. *Id.*

The ancients had these conjectures touching these floods and conflagrations, so as to frame them into an hypothesis for the *castigation* of the excesses of generation. *Hale.*

There were other ends of penalties inflicted, either probatory, *castigatory*, or exemplary. *Bramhall against Hobbes.*

Their *castigations* were accompanied with encouragements; which care was taken to keep me from looking on as mere compliments. *Boyle.*

He had adjusted and *castigated* the then Latin Vulgate to the best Greek exemplars. *Bentley.*

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting it on the soldiery was given to the tribures. Some make it of two kinds; the one with a stick or cane, called fustigatio; the other with rods, called flagellatio: the latter was the most dishonorable.

CASTIGLIONE Delle Stiviere, or **Della Stivera**, a town of Lombardy, in the territory of Mantua, formerly the capital of a principality of this name. It is surrounded with walls, but the castle was long since demolished by the French. The allies took it in 1701, but were defeated near it by the French in 1706. Several actions took place here between the French and Austrians in August, 1796; and Buonaparte conferred a dukedom of this name on Augereau. It is fifteen miles south-east of Brescia, and twenty north-west of Mantua.

Castiglione (John Benedict), a celebrated painter, born at Genoa in 1616. His first master was John Baptist Paggi. He afterwards studied under Andrew Ferrari; and perfected himself under Vandyck, who then resided at Genoa. He painted portraits, historical pieces, landscapes, and castles. In the latter of which he is said chiefly to have excelled; as well as in fairs, markets, and all kinds of rural scenes. We have also a great number of his etchings, which are all spirited, free, and full of taste. His drawing of the naked figure, though by no means correct, is in a style that indicates the hand of a master.

Castiglione (Balthazer), an eminent Italian nobleman, descended from an illustrious family, and born at his own villa at Casalico, in the duchy of Milan, in 1478. He studied painting, sculpture, and architecture, and he so much excelled in these arts, that Raphael Urbino and Buonarotti submitted their works for his approbation. When he was twenty-six years of age Guido Ubaldo, duke of Urbino, sent him ambassador to pope Julius II. He was sent upon a second embassy to Louis XII. of France, and upon a third to Henry VII. of England. Castiglione died in 1529, when acting as legate at Toledo for Clement VII. with Charles V. of Spain. His principal work is entitled Il Cortegiano; the Courtier. A version of it, together with the original Italian, was published at London in 1727, by A. P. Castiglione, a gentleman of the same family.

CASTILE, New, also called the kingdom of Toledo, a province of Spain, bounded on the north by Old Castile, on the east by the kingdoms of Arragon and Valencia, on the south by those of Murcia and Andalusia, and on the west by the kingdom of Leon. It is divided into three parts, Argaria, Mancha, and Sierra; Madrid being the capital. The air is pure and healthy; but the land mountainous, sterile, and neglected, though watered with most beautiful streams. The northern part produces fruits and wine, and the south excellent pasturage. It is watered by the navigable rivers, the Tagus, the Xucar, and the Guadiana, besides smaller streams; and contains the provinces of Toledo, Cuença, Guadalaxara, Madrid, St. Ildefonso, Aranjuez, and St. Lorenzo. The principal towns are, beside the capital, Toledo, Cuença, Requena, and Talavera. It contains one archbishopric, one bishopric, three universities, two cathedrals, and five collegiate chapters, two abbeys, four military commanderies, 116 hospitals, 375 religious houses, and 1301 parishes. Its administration includes one general, and four local military governments, together with four provincial intendancies. Its population, which has not been officially ascertained for many years, is taken at about one million.

An extensive chain of high and rocky mountains, which runs from east to west, divides New from **Old Castile**, a province, with the title of a kingdom. It is about 192 miles in length, and 115 in breadth; bounded on the south by New Castile, on the east by Arragon and Navarre, on the north by Biscay and Asturias, and on the west by the kingdom of Leon. The capital is Burgos. Other principal towns are Valladolid, Segovia, Avila, Calatrava, Logrono, and Soria: its ecclesiastical establishments are, one archbishopric, seven bishoprics, thirty-four chapters, and 394 religious houses. The military government is in a captain general; there are also six provincial intendants, and a royal chancery. Population about 1,200,000.

In the mountains are copper mines, which however have been little attended to, pyrites, quartz, marble, and chalk; also several mineral springs. The chief rivers are the Xalon, Douro, Ebro, Carrion, and Tormes. Part of the soil is very fertile in rye, wheat, and barley: and some districts produce an inferior wine; but the whole province is remarkably destitute of wood. Madder is cultivated with success, and 400 or 500 tons are said to be exported annually. The pasturage is generally fine, and is the foundation of the entire wealth of the province. Segovian wool is nowhere exceeded, if equalled, in quality; the numerous flocks of merino sheep find a salutary exchange of food between the warm plains during winter, and the sides of the mountains in summer; and the butter of Burgos and its neighbourhood is celebrated throughout Spain. The manufactures are confined to a few woollen and linen establishments, those of earthenware, leather, paper, and glass; but wool is the only considerable export. With its three universities, Castile partakes of the universal degradation of Spain, with regard to intellectual culture: literature and the arts are nowhere in Europe at a lower ebb. The inhabitants are remarkably quiet, reserved, proud, and lethargic, in their manners; but honest, simple, and kind. Old Castile has given birth to several of the kings of Spain; those of Castile formerly divided their residence between Burgos and Toledo; but Charles V. transferred the seat of government to Madrid.

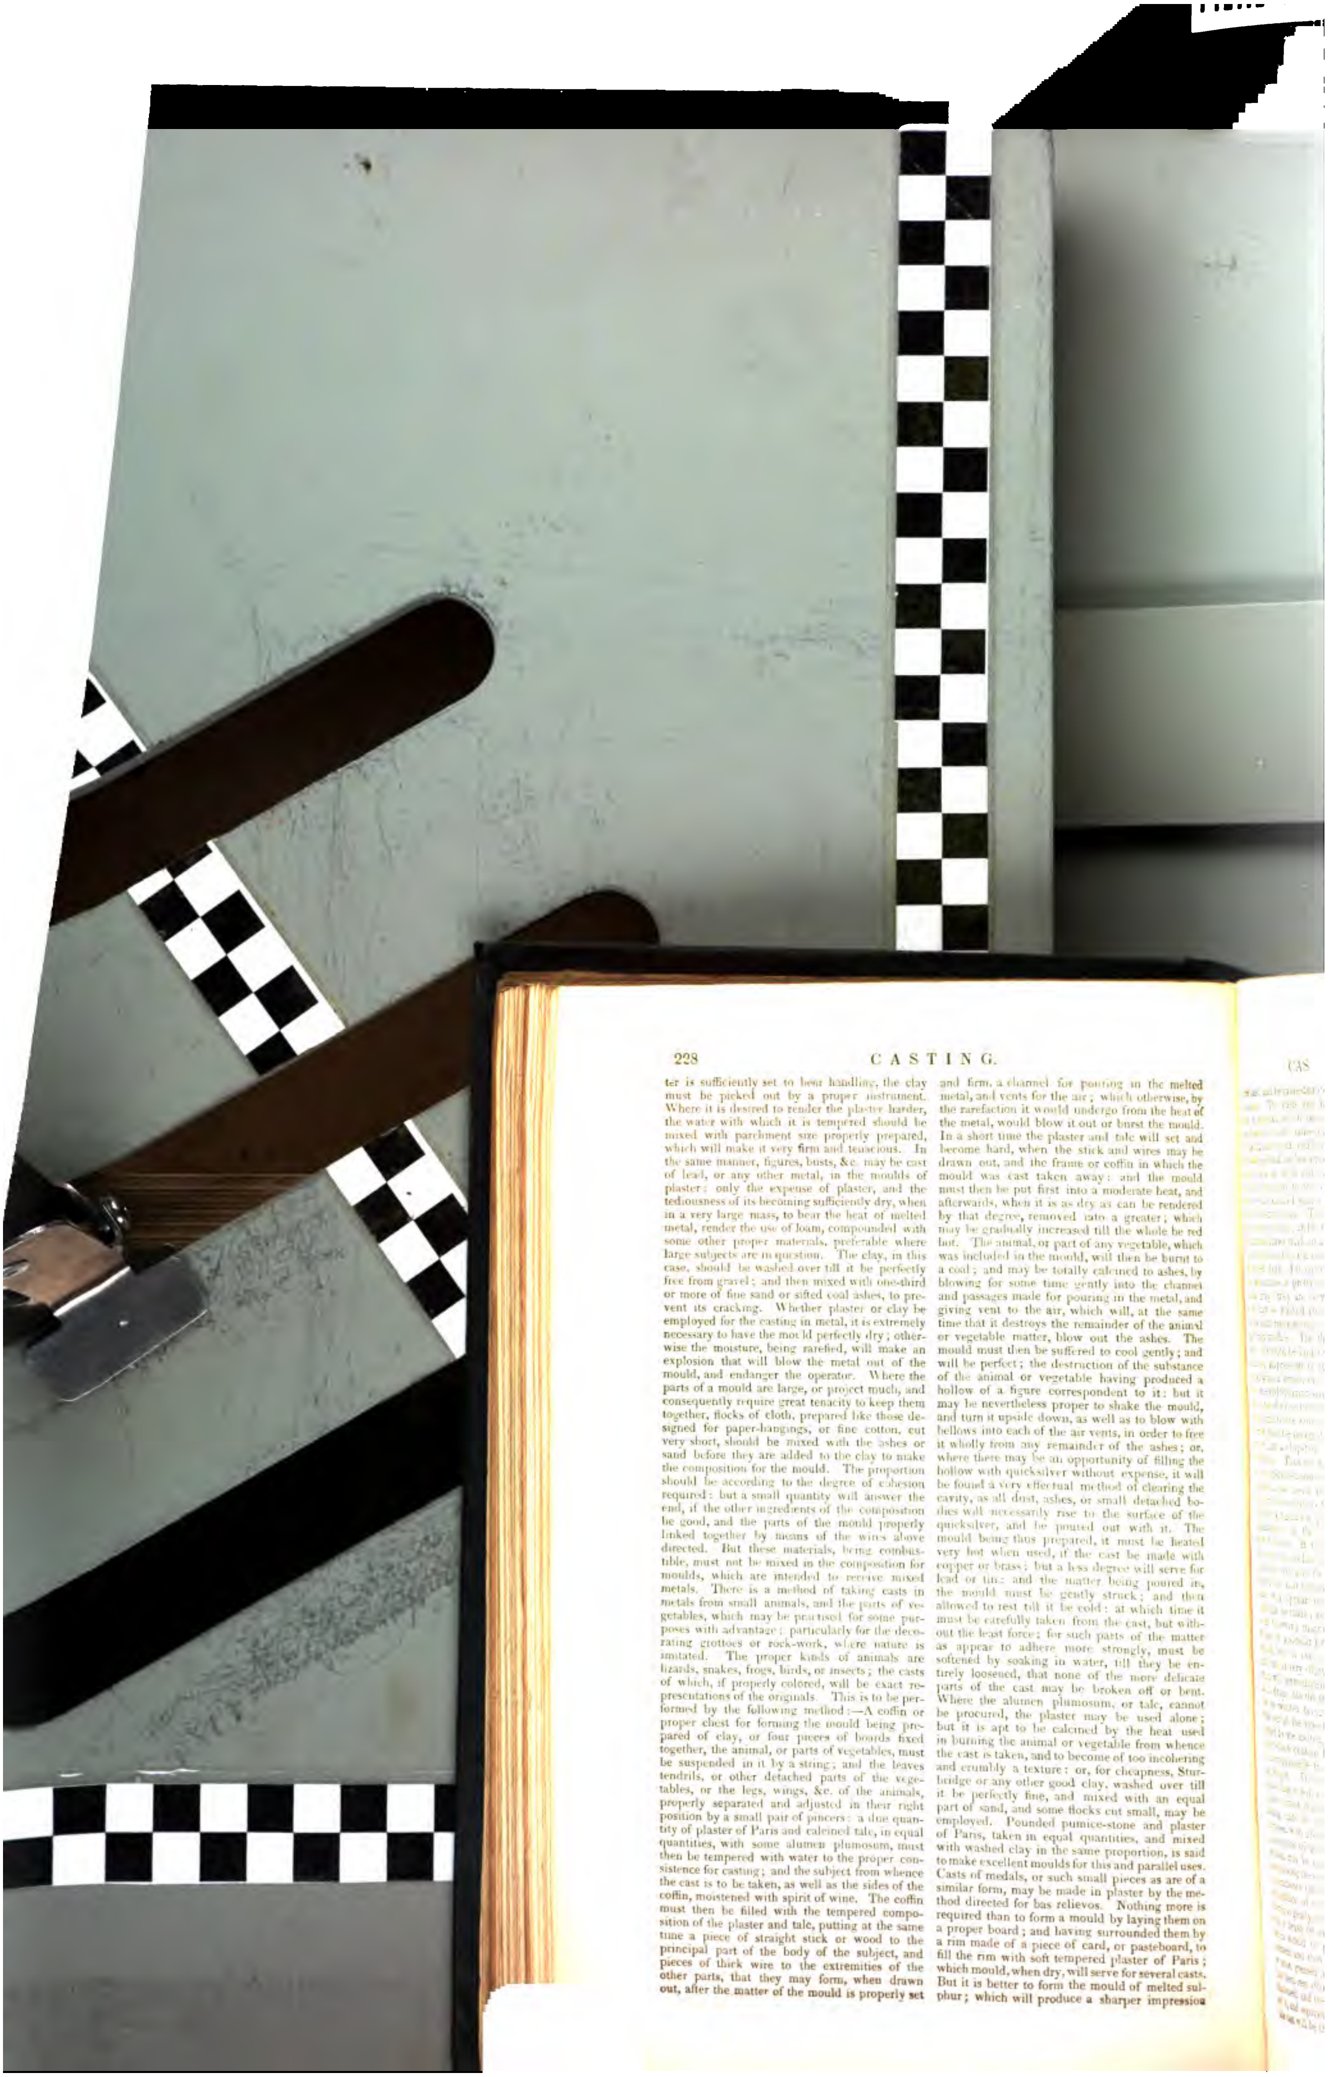
CASTILLAN, or **Castillane**, a gold coin current in Spain, worth fourteen rials and sixteen deniers.

CASTILLON, a town of France, in the department of the Gironde, and ci-devant province of Guienne, seated on the Dordogne, twenty-five miles east of Bourdeaux. It is memorable for a victory obtained by the French over the English in 1451.

CASTING, among sculptors, the taking off casts and impressions of figures, busts, medals, leaves, &c. The method of taking off casts of figures and busts is most generally by the use of

CASTING. 227

Q 2



ter is sufficiently set to bear handling, the clay must be picked out by a proper instrument. Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchment size properly prepared, which will make it very firm and tenacious. In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the moulds of plaster: only the expense of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, render the use of loam, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel; and then mixed with one-third or more of fine sand or sifted coal ashes, to prevent its cracking. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mould perfectly dry; otherwise the moisture, being rarefied, will make an explosion that will blow the metal out of the mould, and endanger the operator. Where the parts of a mould are large, or project much, and consequently require great tenacity to keep them together, flocks of cloth, prepared like those designed for paper-hangings, or fine cotton, cut very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mould. The proportion should be according to the degree of cohesion required: but a small quantity will answer the end, if the other ingredients of the composition be good, and the parts of the mould properly linked together by means of the wires above directed. But these materials, being combustible, must not be mixed in the composition for moulds, which are intended to receive mixed metals. There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practised for some purposes with advantage; particularly for the decorating grottoes or rock-work, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects; the casts of which, if properly colored, will be exact representations of the originals. This is to be performed by the following method:—A coffin or proper chest for forming the mould being prepared of clay, or four pieces of boards fixed together, the animal, or parts of vegetables, must be suspended in it by a string; and the leaves tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated and adjusted in their right position by a small pair of pincers: a due quantity of plaster of Paris and calcined talc, in equal quantities, with some alumen plumosum, must then be tempered with water to the proper consistence for casting; and the subject from whence the cast is to be taken, as well as the sides of the coffin, moistened with spirit of wine. The coffin must then be filled with the tempered composition of the plaster and talc, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, that they may form, when drawn out, after the matter of the mould is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise, by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mould. In a short time the plaster and talc will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mould was cast taken away: and the mould must then be put first into a moderate heat, and afterwards, when it is as dry as can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red hot. The animal, or part of any vegetable, which was included in the mould, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes. The mould must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it: but it may be nevertheless proper to shake the mould, and turn it upside down, as well as to blow with bellows into each of the air vents, in order to free it wholly from any remainder of the ashes; or, where there may be an opportunity of filling the hollow with quicksilver without expense, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies will necessarily rise to the surface of the quicksilver, and be poured out with it. The mould being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass; but a less degree will serve for lead or tin: and the matter being poured in, the mould must be gently struck; and then allowed to rest till it be cold: at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly, must be softened by soaking in water, till they be entirely loosened, that none of the more delicate parts of the cast may be broken off or bent. Where the alumen plumosum, or talc, cannot be procured, the plaster may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly a texture: or, for cheapness, Sturbridge or any other good clay, washed over till it be perfectly fine, and mixed with an equal part of sand, and some flocks cut small, may be employed. Pounded pumice-stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent moulds for this and parallel uses. Casts of medals, or such small pieces as are of a similar form, may be made in plaster by the method directed for bas relievos. Nothing more is required than to form a mould by laying them on a proper board; and having surrounded them by a rim made of a piece of card, or pasteboard, to fill the rim with soft tempered plaster of Paris; which mould, when dry, will serve for several casts. But it is better to form the mould of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster. The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster. For taking casts from medals, a mixture of brimstone and red lead has been recommended; equal parts of these are to be put over the fire in a ladle, till they soften to the consistence of pap; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the medal, previously oiled and wiped clean. The casts are very neat; their color sometimes a pretty deep dark, sometimes a dark gray: they are very durable; and when soiled may be washed clean in spirit of wine. Dr. Lettsom recommends tin foil for taking off casts from medals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, or a pin, till it has perfectly received the impression. The tin foil should now be pared close to the edge of the metal, till it is brought to the same circumference; the medal must then be reversed, and the tin foil will drop off into a chip-box or mould placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plaster of Paris, prepared in the usual manner, may be poured. When dry, the whole is to be taken out, and the tin foil sticking on the plaster will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mould is a little larger than the medal, the plaster running round the tin foil will give the appearance of a white frame, or circular border; whence the new made medal will appear more neat and beautiful. Casts may be made likewise with iron, prepared in the following manner: Take any iron bar, or piece of a similar form, and, having heated it red hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel; and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their color and weight. The iron will thus be rendered so fusible, that it will run with less heat than is required to melt lead; and may be employed for making casts of medals, and many other such purposes, with great convenience and advantage. Impressions of medals, having the same effect as casts, may be made also of isinglass glue by the following means:—Melt the isinglass, beaten, as commonly used, in an earthern pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved: then, with a brush of camel's hair, cover the medal, which should be previously well cleansed and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened, and then, with a pin, raise the edge of it, and separate it carefully from the medal; the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or the medal may be previously coated with leaf gold by breathing on it, and then laying it on the leaf, which will by this means adhere to it; but the leaf gold is apt to impair a little the sharpness of the impression. Impressions of medals may be likewise taken in putty; but it should be the true kind, made of calx of tin, and drying oil. These may be formed in the moulds, or moulds previously taken in plaster or sulphur; the manner directed for those of the plaster. These impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Casting, in foundry, the running a metal into a mould, prepared for that purpose. See Foundry.

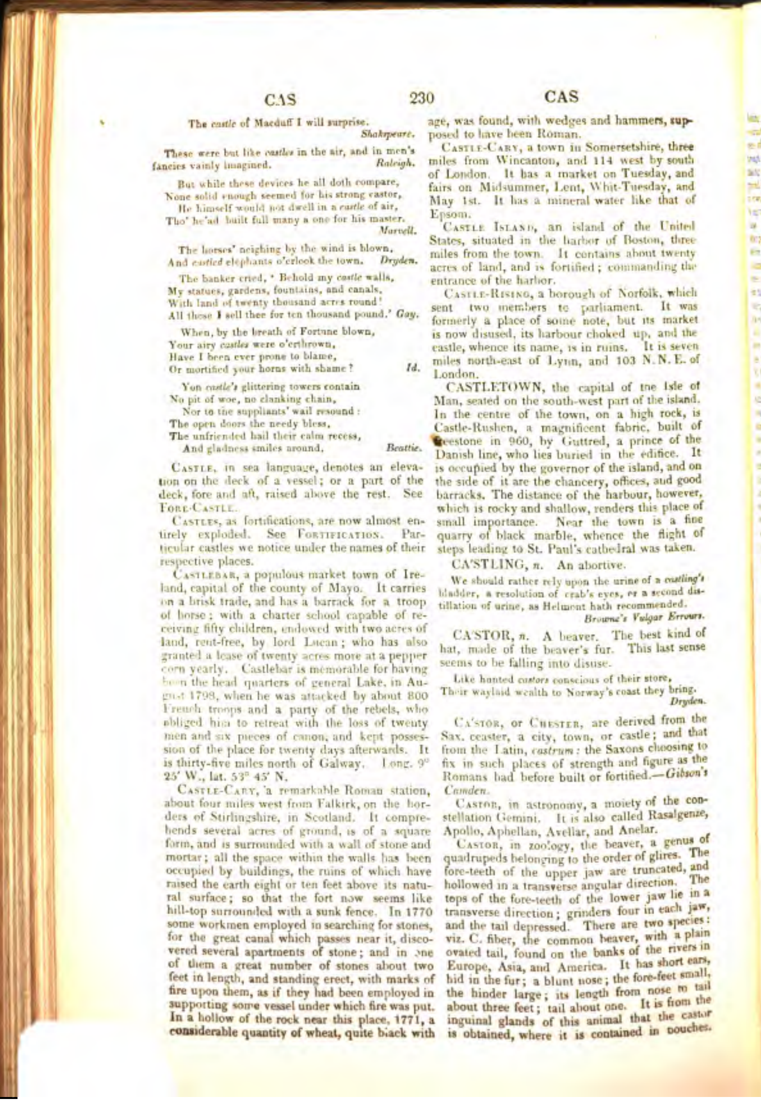
Ca'sting net. A net to be thrown into the water, and not left stationary.

Casting nets did rivers' bottoms sweep. *May's Virgil.*

CA'STLE, *n.*
Ca'stlery, or
Ca'stelry, *n.*
Ca'stlet, *n.*
Ca'stled, *adj.*
Ca'stellain, *n.*
Ca'stellany, *n.*
Castellated, *adj.*
Castella'tion, *n.*
Ca'stle-builder, *n.*
Ca'stle-building, *n.*
Ca'stle-crowned, *adj.*
Ca'stle-guard, *n.*
Ca'stle-ward, *n.*

Goth. *kastali*; Arm. *kestell*; Welsh *castell*; Ital. *castello*; Lat. *castellum*, dim. of *castrum*. Castle, says Johnson, is a strong house, fortified against assaults. A castle, says Sherwood, 'is properly a house furnished with towers, and incompassed by walls and ditches; and strengthened by a mount or donjon in the midst; yet the French courtiers tearme so any house of the king's.' There is another sort of castle, which we call a castle in the air, and the French, chateau en Espagne, which is frequently constructed by men of poetical and sanguine minds. Such constructors bear the name of castle-builders, and their occupation that of castle-building. Their activity in fabricating aërial dwellings very often reduces them to the necessity of inhabiting unpleasant earthly abodes. Castellan is the lord, and also the captain-governor, or constable of a castle; castellany is 'a castlewicke, or castleship; the estate, jurisdiction, or dignitie of a lord castellan;' castelry is the custody or government of a castle. Castellated signifies enclosed within a building, and also castle-like; and castellation, now obsolete, means to fortify a house so as to convert it into a castle. Castle-guard was one of the feudal tenures; and castle-ward an impost, laid upon those who resided within a certain distance of any castle, the produce of which was applied to the maintenance of those who held watch and ward within the fortress. Castled and castle-crowned denote surmounted by a castle.

Now stood hire *castel* faste by the sea,
And often with hire frendes walked she,
Here to disporten on the bank an-hie.
Chaucer. Cant. Tales.



The *castle* of Macduff I will surprise.
Shakspeare.

These were but like *castles* in the air, and in men's fancies vainly imagined. *Raleigh.*

But while these devices he all doth compare,
None solid enough seemed for his strong castor,
He himself would not dwell in a *castle* of air,
Tho' he'ad built full many a one for his master.
Marvell.

The horses' neighing by the wind is blown,
And *castled* elephants o'erlook the town. *Dryden.*

The banker cried, ' Behold my *castle* walls,
My statues, gardens, fountains, and canals,
With land of twenty thousand acres round!
All these I sell thee for ten thousand pound.' *Gay.*

When, by the breath of Fortune blown,
Your airy *castles* were o'erthrown,
Have I been ever prone to blame,
Or mortified your horns with shame? *Id.*

Yon *castle's* glittering towers contain
No pit of woe, no clanking chain,
Nor to the suppliants' wail resound:
The open doors the needy bless,
The unfriended hail their calm recess,
And gladness smiles around. *Beattie.*

Castle, in sea language, denotes an elevation on the deck of a vessel; or a part of the deck, fore and aft, raised above the rest. See Fore-Castle.

Castles, as fortifications, are now almost entirely exploded. See Fortification. Particular castles we notice under the names of their respective places.

Castlebar, a populous market town of Ireland, capital of the county of Mayo. It carries on a brisk trade, and has a barrack for a troop of horse; with a charter school capable of receiving fifty children, endowed with two acres of land, rent-free, by lord Lucan; who has also granted a lease of twenty acres more at a pepper corn yearly. Castlebar is memorable for having been the head quarters of general Lake, in August 1798, when he was attacked by about 800 French troops and a party of the rebels, who obliged him to retreat with the loss of twenty men and six pieces of canon, and kept possession of the place for twenty days afterwards. It is thirty-five miles north of Galway. Long. 9° 25' W., lat. 53° 45' N.

Castle-Cary, a remarkable Roman station, about four miles west from Falkirk, on the borders of Stirlingshire, in Scotland. It comprehends several acres of ground, is of a square form, and is surrounded with a wall of stone and mortar; all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like hill-top surrounded with a sunk fence. In 1770 some workmen employed in searching for stones, for the great canal which passes near it, discovered several apartments of stone; and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessel under which fire was put. In a hollow of the rock near this place, 1771, a considerable quantity of wheat, quite black with age, was found, with wedges and hammers, supposed to have been Roman.

Castle-Cary, a town in Somersetshire, three miles from Wincanton, and 114 west by south of London. It has a market on Tuesday, and fairs on Midsummer, Lent, Whit-Tuesday, and May 1st. It has a mineral water like that of Epsom.

Castle Island, an island of the United States, situated in the harbor of Boston, three miles from the town. It contains about twenty acres of land, and is fortified; commanding the entrance of the harbor.

Castle-Rising, a borough of Norfolk, which sent two members to parliament. It was formerly a place of some note, but its market is now disused, its harbour choked up, and the castle, whence its name, is in ruins. It is seven miles north-east of Lynn, and 103 N.N.E. of London.

CASTLETOWN, the capital of the Isle of Man, seated on the south-west part of the island. In the centre of the town, on a high rock, is Castle-Rushen, a magnificent fabric, built of [illegible]eestone in 960, by Guttred, a prince of the Danish line, who lies buried in the edifice. It is occupied by the governor of the island, and on the side of it are the chancery, offices, and good barracks. The distance of the harbour, however, which is rocky and shallow, renders this place of small importance. Near the town is a fine quarry of black marble, whence the flight of steps leading to St. Paul's cathedral was taken.

CA'STLING, *n.* An abortive.

We should rather rely upon the urine of a *castling's* bladder, a resolution of crab's eyes, or a second distillation of urine, as Helmont hath recommended.
Browne's Vulgar Errours.

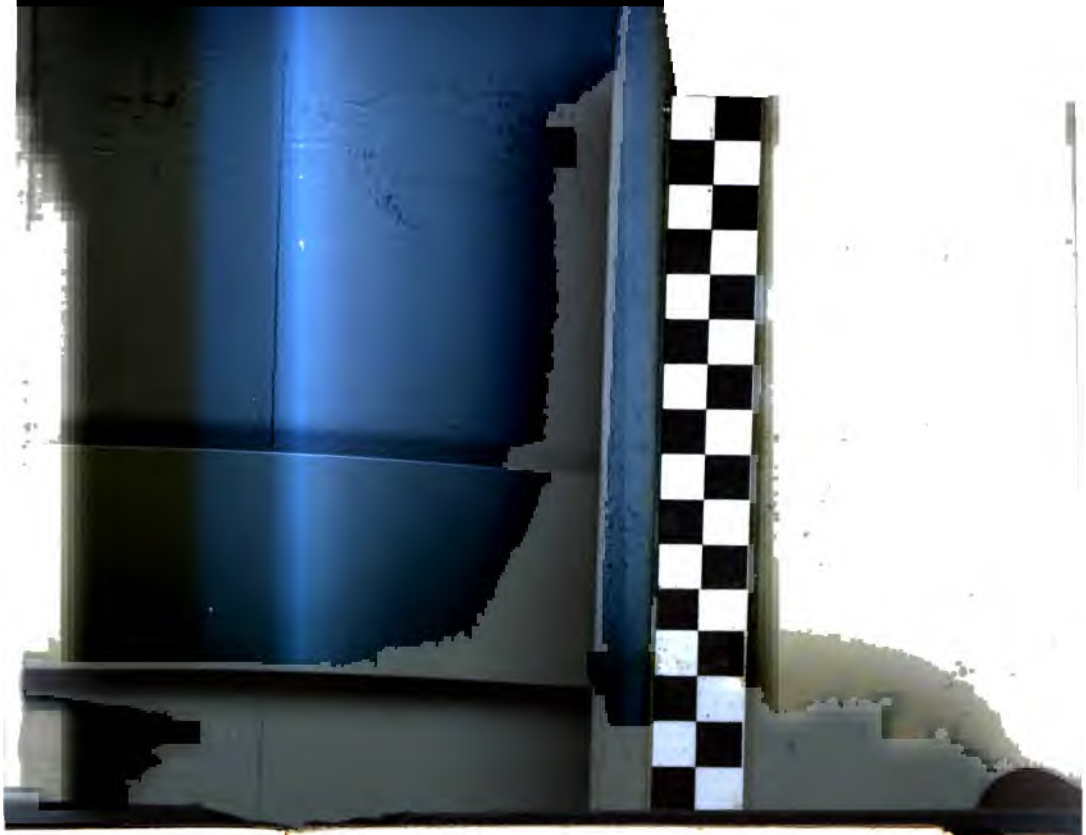
CA'STOR, *n.* A beaver. The best kind of hat, made of the beaver's fur. This last sense seems to be falling into disuse.

Like hunted *castors* conscious of their store,
Their waylaid wealth to Norway's coast they bring.
Dryden.

Ca'stor, or Chester, are derived from the Sax. ceaster, a city, town, or castle; and that from the Latin, *castrum*: the Saxons choosing to fix in such places of strength and figure as the Romans had before built or fortified.—*Gibson's Camden.*

Castor, in astronomy, a moiety of the constellation Gemini. It is also called Rasalgenze, Apollo, Aphellan, Avellar, and Anelar.

Castor, in zoology, the beaver, a genus of quadrupeds belonging to the order of glires. The fore-teeth of the upper jaw are truncated, and hollowed in a transverse angular direction. The tops of the fore-teeth of the lower jaw lie in a transverse direction; grinders four in each jaw, and the tail depressed. There are two species: viz. C. fiber, the common beaver, with a plain ovated tail, found on the banks of the rivers in Europe, Asia, and America. It has short ears, hid in the fur; a blunt nose; the fore-feet small, the hinder large; its length from nose to tail about three feet; tail about one. It is from the inguinal glands of this animal that the castor is obtained, where it is contained in pouches.



', was found, with wedges and hammers, sup- sed to have been Roman.

Castle-Cary, a town in Somersetshire, three les from Wincanton, and 114 west by south London. It has a market on Tuesday, and rs on Midsummer, Lent, Whit-Tuesday, and ay 1st. It has a mineral water like that of som.

Castle Island, an island of the United ates, situated in the harbor of Boston, three les from the town. It contains about twenty res of land, and is fortified; commanding the trance of the harbor.

Castle-Rising, a borough of Norfolk, which nt two members to parliament. It was rmerly a place of some note, but its market now disused, its harbour choked up, and the stle, whence its name, is in ruins. It is seven iles north-east of Lynn, and 103 N.N.E. of ondon.

CASTLETOWN, the capital of the Isle of an, seated on the south-west part of the island. the centre of the town, on a high rock, is astle-Rushen, a magnificent fabric, built of eestone in 960, by Guttred, a prince of the anish line, who lies buried in the edifice. It occupied by the governor of the island, and on e side of it are the chancery, offices, and good rracks. The distance of the harbour, however, hich is rocky and shallow, renders this place of nall importance. Near the town is a fine uarry of black marble, whence the flight of eps leading to St. Paul's cathedral was taken.

CA'STLING, *n.* An abortive.

We should rather rely upon the urine of a castling's adder, a resolution of crab's eyes, or a second di- llation of urine, as Helmont hath recommended. *Browne's Vulgar Errors.*

CA'STOR, *n.* A beaver. The best kind of at, made of the beaver's fur. This last sense eems to be falling into disuse.

Like hunted *castors* conscious of their store, heir waylaid wealth to Norway's coast they bring. *Dryden.*

Ca'stor, or Chester, are derived from the ax. ceaster, a city, town, or castle; and that om the Latin, *castrum*: the Saxons choosing to x in such places of strength and figure as the lomans had before built or fortified.—*Gibson's amden.*

Castor, in astronomy, a moiety of the con- ellation Gemini. It is also called Rasalgeuse, pollo, Aphellan, Avellar, and Anelar.

Castor, in zoology, the beaver, a genus of uadrupeds belonging to the order of glires. The re-teeth of the upper jaw are truncated, and ollowed in a transverse angular direction. The ps of the fore-teeth of the lower jaw lie in a ansverse direction; grinders four in each jaw, nd the tail depressed. There are two species: iz. C. fiber, the common beaver, with a plain vated tail, found on the banks of the rivers in urope, Asia, and America. It has short ears, id in the fur; a blunt nose; the fore-feet small, he hinder large; its length from nose to tail bout three feet; tail about one. It is from the nguinal glands of this animal that the castor s obtained, where it is contained in pouches.

Nothing equals the art with which these animals construct their dwellings. They choose a level piece of ground, with a small rivulet running through it. This they form into a pond by making a dam across; first by driving into the ground stakes of five or six feet in length, placed in rows, wattling each row with pliant twigs, and filling the interstices with clay, ramming it down close. The side next the water is sloped, the other perpendicular; the bottom is from ten to twelve feet thick, but the thickness gradually diminishes to the top, which is about two or three: the length of these dams is sometimes not less than 100 feet. Their houses are made in the water, collected by means of the dam, and are placed near the edge of the shore. They are built on piles; are either round or oval; but their tops are vaulted, so that their inside resembles an oven, the top a dome. The walls are two feet thick, made of earth, stones, and sticks, most artificially laid together, and the walls within neatly plastered. In each house are two openings, the one into the water, the other towards the land. The height of these houses above the water is eight feet. They often make two or three stories in each dwelling, for the convenience of change in case of floods. Each house contains from twenty to thirty beavers; and the number of houses in each pond is from ten to twenty-five. Each beaver forms its bed of moss; and each family forms its magazine of winter provisions, which consist of bark and boughs of trees. These they lodge under water, and fetch into their apartments as occasion requires. Their summer food is leaves, fruits, and sometimes crabs and craw-fish, but they are not fond of fish. To effect these works a community of 200 or 300 assembles; each bears his share in the labor; some fall to gnawing with their teeth trees of great size, to form beams or piles; others roll the pieces along the water; others dive, and with their feet scrape holes in order to place them in; while others exert their efforts to rear them in their proper places; another party is employed in collecting twigs to wattle the piles with; a third in collecting earth, stones, and clay; a fourth is busied in beating and tempering the mortar; others in carrying it on their broad tails to proper places; and with the same instrument they ram it between the piles, and plaster the inside of their houses. A certain number of smart strokes given with their tails is a signal made by the overseer for repairing to such and such places, either for mending any defects, or at the approach of an enemy; and the whole society attend to it with the utmost assiduity. Their time of building is early in summer, for in winter they never stir but to their magazines of provisions, and during that season are very fat. They breed once a-year, and bring forth at the latter end of the winter two or three young at a birth. Besides these associated beavers, there is a variety called terriers, which either want industry or sagacity to form houses like the others. They burrow in the banks of rivers, making their holes beneath the freezing depth of the water, and work up for a great number of feet. These also form their winter stock of provisions. In hunting the beavers the savages sometimes shoot them, always getting on the contrary side of the wind; for they are very shy, quick in hearing, and of a keen scent. This is generally done when the beavers are at work, or on shore feeding on poplar bark. If they hear any noise when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they went in. They sometimes are taken with traps of poplar sticks laid in a path near the water, which, when the beaver begins to feed upon, they cause a large log of wood to fall upon their necks, which is put in motion by their moving of the sticks. The Indians generally prefer this way of taking them, because it does not damage their skins. In winter they break the ice in two places, at a distance from the house, the one behind the other. Then they take away the broken ice with a kind of racket, the better to see where to place their stakes. They fasten their nets to these, which have large meshes, and sometimes are eighteen or twenty yards in length. When these are fixed, they proceed to demolish the house, and turn a dog therein, which, terrifying the beaver, he immediately leaves it, and takes to the water; after which he is soon entangled by the net. The skins are very valuable. See Beaver. 2. C. huidobrius. Chilese beaver. Tail compressed, lanceolate, hairy; fore-feet lobed, hind-feet palmate; head nearly square; snout obtuse; eyes small; ears short, round; hair double like C. fiber; the undermost finer than a rabbit's, and hence valued by furriers; on the back cinereous; belly whitish. Inhabits Chili, in the deepest parts of lakes and rivers; fierce; feeds on fishes, on crabs chiefly; remains long under water; is without the wonderful architecture and castor of C. fiber; produces from two to three young; length about three feet. The soft or short hair very fine, and, like that of C. fiber, used in the manufacture of hats, and certain cloths which have the softness of velvet. In Chili the animal is denominated guillino.

Castor and Pollux, in meteorology, a fiery meteor, which appears sometimes sticking to a part of the ship, in form of one, two, or even three or four balls. When one is seen alone, it is called Helena, which portends the severest part of the storm to be yet behind; two are denominated Castor and Pollux, and sometimes Tyndarides, which portend a cessation of the storm. Castor and Pollux are called by the Spaniards, San Elmo; by the French, St. Elme, St. Nicholas, St. Clare, St. Helene; by the Italians, Hermo; by the Dutch, Vree Vuuren. These meteors are rarely seen till the tempest is nigh spent. When the meteor sticks to the masts, yards, &c., they conclude, from the air's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flutter about, it indicates a storm.

Castor and Pollux, in pagan mythology, were twin brothers, sons of Jupiter, by Leda, the wife of Tyndarus, king of Sparta. Jupiter being enamoured of Leda, changed himself into a beautiful swan, and desired Venus to metamorphose herself into an eagle; after which the goddess pursued the god with apparent ferocity, and .'-

piter fled for refuge into the arms of Leda, who was bathing in the Eurotas. Jupiter availed himself of his situation, and Leda, who was already pregnant, nine months after brought forth two eggs, from one of which issued Pollux and Helena, and from the other Castor and Clytemnestra. The two former were the offspring of Jupiter, and the latter were supposed to be the children of Tyndarus. Immediately after their birth Mercury carried the two brothers to Pallene where they were educated; and when they arrived at mature age they embarked with Jason to go in search of the golden fleece; in which expedition both remarkably displayed their courage. Pollux conquered and slew Amycus, in the combat of the cestus, from which he was ever after considered the god and patron of boxing and wrestling; and Castor distinguished himself in the management of horses. After their return from Colchis they united in the most inviolable friendship, and cleared the Hellespont and neighbouring seas of pirates; and hence they have always been considered friendly to navigation. In a violent storm, during the Argonautic expedition, two flames of fire were seen to play round the heads of the sons of Leda, and the tempest instantly ceased, and the sea was calmed; from which their power to protect sailors has been more firmly believed, and the two fires, so frequent in storms, have since been known by the name of Castor and Pollux. The two brothers made war against the Athenians to recover their sister Helen, whom Theseus had carried away; and from their clemency to the conquered they obtained the surname of Anaces, or benefactors. They were initiated in the sacred mysteries of the Cabiri, and in those of Ceres at Eleusis. Having been invited to a feast when Lynceus and Idas were going to celebrate their marriage with Phœbe and Talaira, the daughters of Leucippus, brother to Tyndarus, they became enamoured of the two women whose nuptials they were to celebrate, and determined to carry them off and marry them, which so provoked Lynceus and Idas, that a battle ensued, wherein Castor killed the former, and was killed by the latter. Pollux being immortal, after killing Idas, to revenge the death of his brother, entreated Jupiter to restore his beloved Castor, or to be himself deprived of immortality; and Jupiter allowed Castor to share the immortality of his brother. Thus, so long as the one was upon earth, the other was detained in the infernal regions, and they lived and died alternately every day; or, as others say, every six months. For this act of fraternal love Jupiter translated them into the skies, where they formed the constellation Gemini, one of which stars rises as the other sets. A martial dance, called the Pyrrhic or Castorian dance, was invented in honor of these deities, whom the Cephalenses placed among the Dii Magni, and offered to them white lambs. The Romans also paid them particular honors, on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favor for which a temple was erected to them in the forum.

Castoreum, in the materia medica, Castor; the inguinal glands of the beaver. The ancients had a notion that it was lodged in the testicles; and that the animal, when hard pressed, would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. According to Bouillon La Grange, it consists of a mucilage, a bitter extract, a resin, an essential oil, in which its peculiar smell appears to reside, and a flaky crystalline matter, much resembling the adipocere of biliary calculi. The best sort of castor comes from Russia. The Russian castor is in large hard round bags, which appear, when cut, full of a brittle, red, liver-colored substance, interspersed with membranes and fibres exquisitely interwoven. An inferior sort is brought from Dantzic, and is generally fat and moist. The American castor, which is the worst of all, is in longish thin cods. Russia castor has a strong disagreeable smell; and an acrid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof spirit both: water elevates the whole of its flavor in distillation: rectified spirit brings over nothing. Castor is looked upon as one of the antihysteric medicines: some celebrated practitioners, nevertheless, have doubted its virtues; and Neuman and Stahl declare it insignificant. Experience, however, has shown that the virtues of castor are considerable, though less than they have in general been supposed.

Castor Oil, in medicine, See Ricinum.

CASTRAMETA'TION, *n.* Lat. *castrametor.* The art or practice of encamping and tracing out camps. By an extension of its original meaning, it is sometimes applied to all the ordinary operations of a campaign.

> Their *castrametation*, even under the most practicable and commodious circumstances of ground, is sometimes ambiguous. *Warton.*

CA'STRATE, *v.*
Castra'tion, *n.* } Lat. *castro.* To geld; to remove the obscene parts of a writing; to take out any part of a book; generally, though seldom used in this sense, to take away. The operation of gelding.

> Ye *castrate* the desires of the flesh. *Martin.*
>
> The largest needle should be used in taking up the spermatic vessels in *castration.* *Sharpe.*

Castration. See Surgery.

Castration of Brutes. See Gelding and Spaying.

Castration of Plants consists in cutting off the antheræ, or tops of the stamina, before they have attained maturity, and dispersed their male dust. This operation has been frequently practised by the moderns, with a view to establish or confute the doctrine of the sexes of plants. See Botany. It succeeds principally on those which have their male flowers detached from the female. In such as have both male and female flowers contained within the same covers, this operation cannot be easily performed without endangering the neighbouring organs.

CASTREN'SIAN, *adj.* Lat. *castrensis.* Belonging to a camp.

CASTRENSIANI, or Castrenses, in antiquity, servants in the Greek emperor's household, who had the care of what related to his table and cloathing.

guinal glands of the beaver. The ancients
notion that it was lodged in the testicles;
hat the animal, when hard pressed, would
hem off, and leave them to its pursuers, as
scious of what they wanted to destroy him
According to Bouillon La Grange, it con-
f a mucilage, a bitter extract, a resin, an
ial oil, in which its peculiar smell appears
de, and a flaky crystalline matter, much re-
ng the adipocere of biliary calculi. The
ort of castor comes from Russia. The
n castor is in large hard round bags, which
, when cut, full of a brittle, red, liver-co-
substance, interspersed with membranes
bres exquisitely interwoven. An inferior
brought from Dantzic, and is generally fat
oist. The American castor, which is the
of all, is in longish thin cods. Russia
has a strong disagreeable smell; and an
bitterish, and nauseous taste. Water ex-
he nauseous part, with little of the finer
rectified spirit extracts this last without
of the nauseous; proof spirit both: water
s the whole of its flavor in distillation:
d spirit brings over nothing. Castor is
upon as one of the antihysteric medicines:
elebrated practitioners, nevertheless, have
d its virtues; and Neuman and Stahl de-

o a camp.
RENSIANI, or CASTRENSES, in anti-
rvants in the Greek emperor's household,
the care of what related to his table and

CASTRES, a large town of France, in the department of the Tarn, and ci-devant province of Languedoc, of which it was recently an episcopal see. It is seated in a fine valley on the Agout, and has some flourishing manufactures of cotton, woollen, silk, and stuffs. In the reign of Louis XIII. Castres was a kind of protestant republic; but in 1629 its fortifications were demolished. Near it are mines of turquoise stones. It was the birth place of Rapin de Thoyras, Abel Boyer, and M. Dacier. It is twenty miles south of Alby, and thirty-five east of Thoulouse. Population 13,727.

CASTRO, or Castremonium, a duchy and town of Italy, in the States of the Church, between St. Peter's Patrimony, the Mediterranean, Tuscany, the Orvietana, and the river Marta. The duchy is about twenty-five miles in length, and from ten to thirteen broad. The town of Castro is situated near the river Ospada, ten miles from the sea, and was once much larger than at present. In 1649 pope Innocent X. ordered it to be razed to the ground, in consequence of the inhabitants having murdered the bishop whom he had sent here. The episcopal see was at this time removed to Aquapendente. Twenty-five miles south-west of Orvieto, and fifty-five north-west of Rome.

Castro, the ancient Mytilene, a sea-port town on the north-east coast of the island of Metelin, standing on a lofty neck of land, with a harbour on each side. It is about a mile in circumference, and is well built. Here is a castle three quarters of a mile in compass; and to the west the ruins of the city of Mytilene. The town contains three or four Greek churches. Distant thirty miles south-west of Adramiti. Long. 26° 28′ E., lat. 39° N.

Castro, the principal town of the island of Lemnos, situated on the west side, and on the site of the ancient Myrina. It is about a mile and a half in circumference, and has a mixed population of about 3000 Turks and Greeks. The latter have three churches and a bishop. On a high rock in the neighbourhood stands a strong castle.

CASTRUCCIO (Castracani), a celebrated Italian general, born at Lucca, in Florence, in 1284, and left by his parent or parents in a vineyard covered with leaves, where he was found by a widow lady and a priest her brother. The lady having no children, they resolved to bring him up, and educate him as their own child. He was destined for the priesthood, but was scarcely eighteen when he entered the army, and was made a lieutenant of a company of foot by Francisco Guinigi, of the party of the Ghibelines. He was soon after made general, and became the chief of the party. Those who had been banished from their country fled to him for protection, and promised, that if he could restore them to their estates, they would serve him so effectually that the sovereignty of their country should be his reward. He entered into a league with the prince of Milan, and kept his army constantly on foot. The Florentines entered into a war with him, but Castruccio fought his way through them; and the supreme authority of Tuscany was ready to fall into his hands, when a period was put to his life. In May, 1328, he gained a complete victory over his enemies, after which he was seized with an ague, which carried him off in a few days, in the forty-fourth year of his age.

CASTRUM Doloris, in writers of the middle age, denotes a catafalco, or a lofty tomb of state, erected in honor of some person of eminence, usually in the church where his body is interred; and decorated with arms, emblems, lights, &c.

CASU Consimili, in English law, a writ of entry granted where a tenant, by courtesy or for life, aliens either in fee, in tail, or for the term of another's life. It is brought by him in reversion against the person to whom such tenant does so alien, to the prejudice of the reversioner in the tenant's life time.

Casu Proviso, a writ of entry founded on the statute of Gloucester, where a tenant in dower aliens the lands she so holds in fee, or for life; and lies for the party in reversion against the alience.

CA'SUAL, *adj.* } Fr. *casuel;* Lat. *casus.*
Ca'sually, *adv.* } All these words signify
Ca'sualness, *n.* } dependence upon accident,
Ca'sualty, *n.* } chance, uncertainty; something that does not arise from a set purpose, but springs from a momentary and unexpected cause. A casualty is a thing that happens suddenly and unforeseen; a mischance that produces unnatural death.

The revenue of Ireland, both certain and *casual*, did not arise unto ten thousand pounds. *Davies on Ireland.*

That which seemeth most *casual* and subject to fortune, is yet disposed by the ordinance of God. *Raleigh.*

With more patience men endure the losses that befal them by mere *casualty*, than the damages which they sustain by injustice. *Id.*

Wool new shorn, laid *casually* upon a vessel of verjuice, had drank up the verjuice, though the vessel was without any flaw. *Bacon.*

Go, bid my women
Search for a jewel, which too *casually*
Hath left my arm. *Shakspeare.*

Builds in the weather on the outward wall,
Even in the force and road of *casualty.* *Id.*

Whether found where *casual* fire
Had wasted woods, on mountain, or in vale,
Down to the veins of earth. *Milton.*

Most of our rarities have been found out by *casual* emergency, and have been the works of time and chance, rather than of philosophy. *Glanville.*

The commissioners entertained themselves by the fire side in general and *casual* discourses. *Clarendon.*

We find one *casualty* in our bills, of which, though there be daily talk, there is little effect.
Grant's Bills of Mortality.

That Octavius Cæsar should shift his camp that night that it happened to be took by the enemy, was a mere *casualty;* yet it preserved a person who lived to establish a total alteration of government in the imperial city of the world. *South.*

I should have acquainted my judge with one advantage, and which I now *casually* remember. *Dryden.*

It is observed in particular nations, that, within the space of two or three hundred years, notwithstanding all *casualties*, the number of men doubles.
Burnet's Theory.

The expences of some of them always exceed their certain annual income; but seldom their *casual* supplies. I call them *casual*, in compliance with the common form. *Atterbury.*

He that resigns his peace to little *casualties*, and suffers the course of his life to be interrupted by fortuitous inadvertencies or offences, delivers up himself to the direction of the wind, and loses all that constancy and equanimity which constitute the chief praise of a wise man. *Johnson. Rambler.*

CASUARINA, in botany, a genus of the monandria order, and monœcia class of plants: MALE CAL. of the amentum: COR. a bipartite scale: FEMALE CAL. of the amentum: COR. none: the STYL. bipartite: fruit, a cone. Species, five: three from the South Sea islands, and two from the East Indies.

CA'SUIST, *n. s.* } Fr. *casuiste*; from
CASUI'STICAL, *adj.* } Lat. *casus*. A casuist is
CA'SUISTRY, *n.* } one who studies, and gives judgment upon, cases of conscience; and who, generally, is too prone to deal in dangerous subtleties, and 'to divide a hair twixt north and north-west side.' Pascal has exposed this race of beings, and their shameful casuistry, in a masterly manner, in his Provincial Letters.

The judgment of any *casuist*, or learned divine, concerning the state of a man's soul, is not sufficient to give him confidence. *South.*

What arguments they have to beguile poor simple unstable souls with, I know not, but surely the practical, *casuistical*, that is, the principal vital part of their religion savours very little of spirituality. *Id.*

You can scarce see a bench of porters without two or three *casuists* in it, that will settle you the rights of princes. *Addison.*

Who shall decide when doctors disagree,
And soundest *casuists* doubt, like you and me. *Pope.*

One only doubt remains, full oft I've heard,
By *casuists* brave and deep divines averred,
That 'tis too much for human race to know,
The bliss of heaven above, and earth below. *Id.*

This concession would pass for good *casuistry* in these ages. *Id. Odyssey. Notes.*

Morality, by her false guardians drawn,
Chicane in furs, and *casuistry* in lawn. *Id.*

CASUISTS. Escobar has made a collection of the opinions of all the casuists before him. M. Le Fevre, preceptor of Louis XIII. called the books of the casuists the art of quibbling with God. Mayer published a bibliotheca of casuists, containing an account of all the writers on cases of conscience, ranged under three heads; the first comprehending the Lutheran, the second the Calvinist, the third the Romish, casuists.

CASUISTRY is drawn partly from natural reason or equity; partly from authority of Scripture, the canon law, councils, fathers, &c. To casuistry belongs the decision of all difficulties arising about what a man may concern himself, and lawfully do or not do; what is sin or not sin; what things a man is obliged to do, to discharge his duty; and what he may omit without breach of it. Professors of casuistry, however, have confined themselves to no rule of morals which they have not instructed mankind to evade. The Jesuits held the foremost rank in this long-famous study: until the Lettres Provinciales of Pascal, swept their whole system into the dust. A useful English translation of them was given to the public a few years since, by Dr. Cox.

CASUS OMISSIONIS, in Scots law. In action proving the tenor of obligations inextinguishable by the debtor's retiring or cancelling them, it is necessary for the pursuer, before he is allowed a proof of the tenor, to condescend upon such a casus omissionis, or accident by which the writing was destroyed, as shows it was lost while in the writer's possession.

CASWELL, a county of North Carolina, in Hillsborough district; bounded on the east by Person; on the north by Virginia: on the west by Guilford, and on the south by Orange county. Leesburgh is the chief town.

Spectator.

Three *cat-calls* be the bribe
Of him whose chattering shames the monkey tribe.
Pope.

Have I not sat with thee full many a night,
When dying embers were our only light,
When every creature did in slumbers lie,
Besides our *cat*, my Colin Clout and I!
No troublous thoughts the *cat* or Colin move,
While I alone am kept awake by love. *Gay.*

Let *cats* and *catlings* of ignoble line,
Slumber in bee-hive chairs, in dairies dine.
Huddisford.

Ye sage divines, if so concise our span,
Who for preferment would turn *cat-in-pan*?
Since clergymen and *cats* one fate betides,
And worms shall eat their sermons and their hides.
Id.

There, like Alcena's, shall Grima'kin's son
In bliss repose, his mousing labours done;
Fate, envy, curs, time, tide, and traps, defy,
And *caterwaul* to all eternity *Id.*

CAT, in sea affairs, a ship employed in the coal trade, formed from the Norwegian model. It is distinguished by a narrow stern, projecting quarters, a deep waist, and by having ornamental figures on the prow. These vessels are generally built remarkably strong, and carry from 400 to 600 tons, or in the language of the mariners, from twenty to thirty keels of coals. Cat is also a sort of strong tackle, or combination of pullies, to hook and draw the anchor perpendicularly up to the cat-head.

CAT, in zoology. See FELIS.

CATABA'PTIST, Gr. κατα and βαπτιζω. An opponent, or abuser, of baptism, particularly of that of infants.

CATABASION, from καταβαινειν, to descend; in the Greek church, a place under the altar wherein the relics are kept.

CATABAW, a river of the United States, which rises at the foot of the Apalachian Mountains, in North Carolina; thence runs east for nearly forty miles; then turns gradually south, afterwards south by east, and passing into South Carolina, where it obtains the name of the Wateree, afterwards unites with the Congaree, and forms the Santee.

CATABAW, a town of South Carolina, in the north part of Camden district, a few miles east of the river of this name adjoining the divisional line of north Carolina, near the main road leading from Camden to Charlotte, about fifty-six miles north from Philadelphia.

The CATABAW INDIANS were a nation of North Americans, inhabiting the above town and district. They were for many years at war with the Six Nations, and were reckoned the most formidable of their enemies. They have often penetrated into their country, which it is said no southern or western tribe ever did.

CATABULENSES, in the middle age, a sort of ministers of the empire, appointed to conduct the public carriage from one catabulum, or stage, to another. The catabulenses also had the charge of conveying the public corn to and from the mills; whence, in the Theodosian code, they are joined with bakers.

CATABULUM, in the middle age, a kind of stable, wherein beasts, especially of burden and carriage, were kept for the public service. The ancient Christians were sometimes condemned to serve in the catabula, that is to work at the cleaning of them, attending the beasts, &c.

CATACHRE'SIS, *n.* } From καταχρησις,
CATACHRE'STICAL, *adj.* } abuse. The catachresis is, however, not always a fault; it is even sometimes a great beauty. It is a trope, which borrows the name of one thing to express another; and is censurable only when it is ungracefully and violently employed. When, in describing the descent of Raphael, Milton, instead of using the word flies, says, that he '*sails* between worlds and worlds,' the catachresis gives additional animation. Catachrestical is forced, far-fetched.

I ask, if now and then he does not offer at a *catachresis*, wresting and torturing a word into another meaning. *Dryden.*

A *catachrestical* and far-derived similitude it holds with men, that is, in bifurcation.
Browne's Vulgar Errours.

CATACLASIS, from κατακλαω, I distort; in medicine, denotes a disorder of the eye, wherein the eyelid is inverted by a convulsion of the muscles that close it.

CA'TACLYSM, old Fr. *cataclisme*; κατακλυσμος. A deluge; an inundation: used generally for the universal deluge.

The opinion that held these *cataclysms*, and empyroses universal, was such as held that it put a total consummation unto things in this lower world. *Hale.*

CA'TACOMBS, *n.* From κατα and κομβος, a hollow or cavity. Subterraneous cavities for the burial of the dead, of which there are a great number about three miles from Rome, supposed to be the caves and cells where the primitive Christians hid and assembled themselves, and where they interred the martyrs, which are accordingly visited with devotion. *Chambers.*

On the side of Naples are the *catacombs*, which must have been full of stench, if the dead bodies that lay in them were left to rot in open niches. *Addison.*

CATACOMBS are subterraneous caves used for tombs, and sometimes form streets of tombs. They have been constructed of various forms by all ancient nations; but those of Egypt, Naples, Syracuse, and Paris, may be considered as the most celebrated.

Before we enter into any detailed account of the Egyptian catacombs, it will be but just to furnish some notice of the labors of the distinguished and persevering individual to whom we are principally indebted for our knowledge of these vast funeral relics. If the late Mr. Belzoni was less critically, or less profoundly, versed in the science and literature of antiquity, than some other of those European travellers who have busied themselves in exploring the wonders of Egypt, he was in native shrewdness of observation, enterprising perseverance, and presence of mind in new and untried situations, inferior to none, and superior to most. It was he who found access to that pyramid (of Cephrenes) whose interior chambers the mercenary cupidity, and the antiquarian curiosity, of centuries had sought for in vain; and it was Belzoni who, not merely discovered and penetrated the subterranean mysteries of a Theban tomb, or rather a sepulchral palace, or perhaps temple, which had been closed for thousands of years; but actually, though possessed of very limited resources, save those of his own ingenuity, effected its virtual transportation from the capital city of the ancient world, to the metropolis of the modern.

Our space will only permit a notice of Belzoni's principal discovery, namely, the tomb of 'Psammis the Powerful,' which may assuredly be considered as the chef d' œuvre of ancient sepulture. It is situated in the neighbourhood of Beban el Malook; and Belzoni, when he had passed through the external aperture, found himself in a beautiful hall, twenty-seven feet six inches, by twenty-five feet ten inches, in which were four pillars, three feet square. At the end of this room, and opposite the aperture, is a large door, from which three steps lead down into a chamber with two pillars. This is twenty-eight feet two inches, by twenty five feet six inches. The pillars are three feet ten inches square. Returning into the entrance-hall, he saw on the left of the aperture a large staircase, which descended into a corridor; this is thirteen feet four inches long, seven and a half wide, and has eighteen steps. At the bottom he entered a beautiful corridor thirty-six feet six inches, by six feet eleven inches. Belzoni perceived that the paintings became more perfect as he advanced farther into the interior. They retained their gloss, or a kind of varnish over the colors, which had a beautiful effect; the figures being painted on a white ground. At the end of this corridor he descended ten steps into another, seventeen feet two inches, by ten feet five inches. Proceeding onwards, through a series of apartments, Belzoni says that the treasure he found in the centre of the principal saloon had not 'its equal in the world.' The sarcophagus to which he alludes is now in the British Museum, and is formed of the finest oriental alabaster, nine feet five inches long, and three feet seven inches wide; its thickness is only two inches, and it is transparent when a light is placed in the inside of it. It is minutely sculptured within and without with several hundred figures, which do not exceed two inches in height. The cover was not there, it had been taken out and broken into several pieces, which were found in digging before the first entrance. The sarcophagus was over a staircase in the centre of the saloon, which communicated with a subterraneous passage leading downwards, hree hundred feet in length. At the end of this ssage was found a great quantity of bats' dung, which choked it up. One hundred feet from the entrance was a staircase in good preservation, but the rock below had changed its substance from a beautiful solid calcareous stone into a kind of black rotten slate, which crumbled into dust only by touching. Belzoni, in further describing the tomb, says 'this subterraneous passage proceeded, in a south-west direction through the mountain;' and he adds, 'I measured the distance from the entrance, and also the rocks above, and found that the passage reaches nearly half way through the mountain to the upper part of the valley. I have reason to suppose that this passage was used to come into the tomb by another entrance, but this could not be after the death of the person who was buried there, for at the bottom of the stairs just under the sarcophagus a wall was built, which entirely closed the communication between the tomb and the subterraneous passage. Some large blocks of stone were placed under the sarcophagus horizontally, level with the pavement of the saloon, that no one might perceive any stairs or subterranean passage was there. The door-way of the side-board room had been walled up, and forced open, as we found the stones with which it was shut, and the mortar in the jambs. The staircase of the entrance-hall had been walled up also at the bottom, and the space filled with rubbish, and the floor covered with large blocks of stone, so as to deceive any one who should force the fallen wall near the pit, and make him suppose that the tomb ended with the entrance-hall and the drawing-room. The tomb faces the north-east, and the direction of the whole runs straight south-west.'

The tombs of Gournou are not far from Carnak. These sepulchres are excavated in all directions in the rocks, but generally with the entrance facing the east, as the chain of these mountains runs from north to south. They are intermixed of all sizes, and some of them have porticoes hewn out of the rocks before the entrance; but generally they are within the outer door, which is mostly adorned with well-finished figures and hieroglyphics, and generally the watchful fox is represented at each side of the inner door leading to the grotto. Some of them are very extensive, and run down in various directions, something like winding stairs, having on each side, at regular distances of a few paces, small chambers to deposit the mummies. Some have deep shafts, or wells, with excavations on each side of the shaft to receive the mummies; and at the bottom of the wells are passages leading to smaller apartments, with endless winding recesses.

Upper Egypt also contains some very remarkable catacombs. They are situated in the neighbourhood of the great canal, and consist of galleries extending a considerable way under ground, or rather into the rock. They were probably at first the quarries, whence the stones necessary for building the houses of Alexandria were extracted; and after having furnished the people of the country with materials for their habitations during their lives, they become their last abode after death. Though of immense extent, they did not require laborious efforts, the stratum of stone being calcareous and soft. It was, no doubt, on account of the softness of the rock that the ancient Egyptians covered the inside of the galleries with a kind of mortar, which has acquired a great degree of solidity, and is not easily broken. The great part of these subterraneous passages have fallen in. In the small number of those in which it was still possible to penetrate, was perceivable, on each side, three rows of tombs placed one above another. Their longest sides form an inclined plane inwards, so that the bottom of the tomb is much narrower than the upper part. At the extremity of some of these galleries there are separate chambers with their tombs, set apart, no doubt, for the interment of a family, or of a particular class of citizens.

If we may believe the Arabs, the catacombs have a subterraneous communication with the pyramids of Memphis. This opinion of their immense extent appears exaggerated. It does not, however, go beyond the other gigantic works of the Egyptians, and might be worth the trouble of verification. It is more certain that they extend as far as the sea at the head of the old port. The three grottoes, or cavities, hollowed out of the rock by the sea side, which the Egyptians have honored, rather improperly, with the name of Cleopatra's baths, appear to be a continuation of them. See EGYPT and AFRICA.

The catacombs ot Syracuse must now be noticed. These excavations commence beneath the church of St. John, and the primitive Christians are supposed to have assembled here secretly in times of persecution, and also to have interred their brethren in these vaults. These subterraneous alleys cross each other in many directions, and are hewn with more care and regularity than the catacombs of St. Januarius at Naples. On each side of the walls are recesses cut into the rock, and in the floor of these cavities coffins of all sizes have been hollowed out. In some places there are twenty troughs, one behind another; skeletons have been often found in them, with a piece of money in their mouths. Swinburne says that he saw 'a gold coin of the time of Icetas, that was just taken out of the jaws of a body found in a tomb here.'

Naples also boasts its catacombs, though they are in no shape comparable to those already noticed. There is a curious circumstance connected with the public exhibition of tne dead in these vaults, which deserves to be noticed. It is thus described by Swinburne:—'It is a custom here, on All Souls Day, to throw open the charnel-houses, lighted up with torches, and decked out with all the flowery pageantry of May-day; crowds follow crowds through these vaults to behold the coffins, nay the bodies, of their friends and relations; the floors are divided into beds like a garden; and under these heaps of earth the corpses are laid in regular succession; the place is perfectly dry, for the soil is rather a pounded stone than earth, and parches up the flesh completely in a twelvemonth; when that period is elapsed, tne body is taken up, dressed in a religious habit, and fixed like a statue in a niche; many retain a horrid resemblance to what they were when animated; and some show strong marks of agony in their distorted features.' They are much better preserved than the mummies of Toulouse, which pass for such singular curiosities.

The Parisian catacombs are of a comparatively modern date; and their employment as burial places appears to have originated in a 'royal ordinance, dated 1777.' Prior to that time they had been little more than a series of rudely constructed excavations or quarries, from whence the stone for the erection of Paris had been raised. The quarries had been worked from time immemorial without any system, every man working where he would, till it became dangerous to work them farther; and it was only known, as a popular tradition, that they extended under great part of the city, till the year 1774, when some alarming accidents roused the attention of the government. They were then properly surveyed, and plans of them taken, and the result was the frightful discovery that the churches, palaces, and most of the southern parts of Paris were undermined, and in imminent danger of sinking into the pit below them. A special commission was appointed to direct such works as might be required. The necessity of the undertaking was fully shown the very day that the commission was installed; a house in the Rue d'Enfer having that day sunk down eight-and-twenty metres below the level of its court-yard. Engineers were now employed to examine the whole of the quarries, and prop the streets, churches, palaces, and buildings which were in danger of being engulfed. One set of workmen were employed in this curious service—another in exploring the labyrinth of excavations, some of which were under the others, and opening galleries between them, that the extent of the peril might be known; and, to prevent future evils of the same kind, all the quarries which were still in use in the environs of Paris, were placed under the inspection of the commissioners, that they might be worked upon some safe system. Never had any men a more arduous or more important commission. The pillars which had been left by the quarriers in their operations, without any regularity, were, in many places, too weak for the enormous weight above; and, in most places, had themselves been undermined, or perhaps originally stood upon ground which had previously been hollowed. In some instances they had given way, in others the roof had dipt and threatened to fall; in others again, great masses had fallen in. The great aqueduct of Arcueil passed over this treacherous ground; it had already suffered some shocks, and if the quarries had continued to be neglected, an accident must sooner or later have happened to this water-course, which would have cut off the supply from the fountains of Paris, and have filled the excavations with water.

Such was the state of the quarries when the commission was appointed in 1777, under M. Charles Guillaumot, as inspector-general. The thought of converting them into a necropolis originated with M. Lenoir, lieutenant-general of the police; and the proposal for removing the dead from St. Innocent's was the more easily entertained, because a receptacle so convenient and so unexceptionable in all respects, was ready to receive them. That part of the quarries under the Plaine de Mont Souris was allotted for this purpose; a house known by the name of La Tombe Isoire, or Isound (from a famous robber who once infested that neighbourhood), on the old road to Orleans, was purchased with a piece of ground adjoining; and the first operations were to make an entrance into the quarries by a flight of seventy-seven steps (the depth being seventeen metres), and to sink a well from the surface, down which the bones might be thrown. Meantime the workmen below walled off that part of the quarries which was designed for the great charnel-house, opened a communication between the upper and lower vaults, and built pillars to prop the roof. When all these necessary preliminaries had been completed, the ceremony of blessing and consecrating the intended catacombs was performed with great solemnity; and on that same day the removal from the cemetery began.

The catacombs, during the revolution, were so much neglected, that in many places the soil had fallen in, and choked the communications; water came in by filtration, the roof was cracked in many places, and threatened fresh downfalls, and the bones themselves lay in immense heaps, mingled with the rubbish, and blocking up the way. It was not till 1810 that M. de Thury was enabled to pursue his plans; and the workmen then had to make galleries through the bones themselves, which in some places lay above thirty yards thick. It was necessary also to provide for a circulation of air, the atmosphere not having been improved by the quantity of animal remains which had been introduced. The manner in which this was effected is singularly easy. The wells which supplied the houses above with water were sunk below the quarries, and formed in those excavations so many round towers. M. de Thury merely opened the masonry of these walls, and luted into the opening the upper half of a broken bottle, with the neck outwards: it is only necessary to uncork two, three, or more of these bottles when fresh air is wanted. Channels were made to carry off the water, steps constructed from the lower to the upper excavation, pillars built in good taste to support the dangerous parts of the roof, and the skulls and bones built up along the walls: those which bore marks of disease, or were otherwise remarkable for their formation, were set apart, and arranged in a cabinet. The whole range was then fitted up with ornaments and inscriptions. Among the ornaments was a fountain, in which four golden fish are imprisoned. They appear to have grown in this unnatural situation, but they have not spawned; three of them have retained their brilliant color, but some spots have appeared upon the fourth; and it seems probable that exclusion from light may produce, though more slowly, the same effect upon them that it does upon vegetables.

The spring which rises here was discovered by the workmen, the basin was made for their use, and a subterraneous aqueduct carries off the waters. M. de Thury named it at first the 'Spring of Oblivion,' and inscribed over it these lines of Virgil:—

> Animæ quibus altera fato
> Corpora debentur, Lethæi ad fluminis undam
> Securos latices et longa oblivia potant.

This inscription has very properly been changed for the most apposite text which could have been found in Scripture:—Whosoever drinketh of this water shall thirst again: but whosoever drinketh of the water that I shall give him shall never thirst: but the water that I shall give him shall be in him a well of water, springing up into everlasting life.'

Amongst the other objects of attention in these subterranean vaults, may be particularly enumerated the mineralogical cabinet, which contains specimens of the strata of the soils of the catacombs; the collection of diseased bones; the revolutionary tombs and obelisks, and the fountain of the Woman of Samaria.

CATACOUSTICS, from *κατα* and *ακυω*, I hear; called also cataphonics, the science of reflected sounds, or that part of acoustics, which considers the properties of echoes. See Acoustics.

CATADIOPTRIC, or Catadioptrical, from *κατα*, against, and *διοπτεμαι*, to look through; belonging to a reflecting telescope.

CATADROMUS, from *κατο* and *δρομος*, a race, in antiquity, a stretched sloping rope in the theatres, down which the Funambuli walked to show their skill. Elephants were also taught to run down the catadromus. Suetonius speaks of the exploit of a Roman knight, who passed down the catadromus, mounted on an elephant's back.

CATAFALCO, Ital. a scaffold, a decoration of architecture, sculpture, and painting; raised on a timber scaffold, to show a coffin or tomb, in a funeral solemnity.

CATAGMATICK, *adj.* *καταγμα*, a fracture. That which has the power of consolidating the parts.

> I put on a *catagmatick* emplaster, and, by the use of a laced glove, scattered the pituitous swelling, and strengthened it. *Wiseman.*

CATAGRAPHA, in antiquity, denote oblique figures or views of men's faces, answering to what the moderns call profiles.

CATAHOOCHEE, a large navigable river of the United States, in Georgia, which rises in the Apalachian mountains, and running south through an extensive and fertile country, belonging to the Creek Indians, unites with the Flint in lat. 31°, and forms the Appalachicola.

CATALEPSIS, and Catalepsy, *n.* } Κατάληψις. A lighter species of the apoplexy or epilepsy.

> There is a disease called a *catalepsis*, wherein the patient is suddenly seized without sense or motion, and remains in the same posture in which the disease seizeth him. *Arbuthnot.*

> And three fat mice slew for his second course!
> But, while the third his grinders dyed with gore,
> Sudden those grinders closed—to grind no more!
> And (dire to tell) commissioned by Old Nick,
> A *catalepsy* made an end of Dick. *Huddisford.*

Catalepsis, from καταληψις, to seize or hold; catalepsy, a sudden suppression of motion and sensation; the body remaining in the same posture that it was in when seized. See Medicine.

CATALOGUE, *v.* & *n.* } Fr. *catalogue*,
Ca'talogize, *v.* } Ital. and Span. *catalogo*; Lat. *catalogus*; καταλογος. A roll, list, register, or enumeration of particulars; a register of things one by one.

> In the *catalogue* ye go for men;
> Showghes, water rugs, and demy wolves, are cleped
> All by the name of dogs. *Shakspeare.*
>
> Make a *catalogue* of prosperous sacrilegious persons, and I believe they will be repeated sooner than the alphabet. *South.*
>
> In the library of manuscripts belonging to St. Laurence, of which there is a printed *catalogue*, I looked into the Virgil which disputes its antiquity with that of the Vatican. *Addison.*
>
> Studied, deliberated, *catalogued* files of murder. *Burke.*
>
> Dick, premier cat upon the *catalogue*
> Of cats that grace a caterwauling age,
> Scared by fate's cat-call quits this earthly stage! *Huddesford.*

CATALONIA, a mountainous province on the north-east of Spain, bounded on the north by the Pyrenees, on the east by the Mediterranean, on the south by Valencia, and on the west by Arragon. It is about forty-four leagues long, and forty broad. The mountains are rich in iron, marble, lead, and coal, as well as in copper, tin, antimony, and other minerals. There are also found occasionally here topazes, amethysts, colored crystals, and other stones. The rivers and mineral waters of Catalonia are also numerous, and almost all flow into the Ebro. Irrigation is here carried on systematically, and the agriculture, as well as the general state of the manufactures and commerce, is superior to that of any part of Spain. The principal objects of culture are vines, on the largest scale; olives, silk, hemp, and flax; a few flocks of sheep are also raised. The wool produced is not above 30,000 cwt. annually. Another point in which Catalonia affords a striking contrast to other provinces of Spain, is in the abundance of its plantations. Elms, poplars, pines, spread over a variety of situations; and cork trees are so abundant, that this province exports this useful commodity to almost every part of Europe. The inhabitants are in number about 900,000, of which about 12,500 belong to the ecclesiastical profession or to monasteries; 7,000 come under the description of students (1020 to the law), while the titled class, or noblesse, are computed at 1266; and the number of servants at 20,963. The province contains one university, one archbishopric, one grand priory, seven bishoprics, sixteen commanderies of the order of Malta, and above 300 religious establishments. Its capital is Barcelona; the other principal towns are Tarragona, Tortosa, Lerida, Gerona, Figueras, and Manresa. A great trade was formerly carried on between Catalonia and the American colonies of Spain, and the commerce of the province is still brisk with Italy, the south of France England, Holland, and the north of Europe, the exports consist in produce of the province, and the imports in manufactures, corn, and salt fish. The inland traffic is chiefly with Arragon, which yields the Catalonians corn, wool, and silk. The principal manufactures are woollens, silks, and cottons, hats, leather, gunpowder, and hardware. The roads are said to be much neglected.

Catalonia was that part of Spain which first attracted the attention of the Romans, and first received the power and miseries of their sway. It was taken from them by the Goths in 470; from the latter by the Moors towards the year 712; and from them by the French in the beginning of the ninth century. Barcelona now became the capital of a territory, which corresponded in limits with the present province; and the last of its counts, Raymond V., ascended the throne of Arragon in 1137. The family then extended its dominion over the islands of Majorca and Minorca, the kingdom of Valencia, and finally the whole Spanish monarchy. The counts of Barcelona divided Catalonia into viguieries, which were governed by officers called viguiers. During the war of the succession, the inhabitants joined the standard of the archduke Charles; but, when the imperial troops had evacuated Spain, they were, after an obstinate resistance, obliged to yield to Philip V. The province then lost its privileges and peculiar laws, in punishment for its turbulent spirit, and became governed like the other parts of Spain.

The Catalonians are haughty and authoritative, looking down upon the rest of their countrymen as decidedly their inferiors; they regard the Castilians, in particular, with aversion; and bear towards the French an invincible animosity. They are distinguished, it is said, on the other hand, for their honesty, steadiness, and diligence. The principal families in Madrid generally have Catalans at the head of their affairs; and they are scattered, as muleteers and callessieros, over every province of the kingdom. Laborde has well described their general character. 'The desire of wealth,' says he, 'makes them industrious; emulation makes them active, leads them to every part of the word, and enables them to brave the perils of long voyages; and glory blinds them to every kind of danger. When they love, they love warmly; but their hatred is implacable, and they have rarely sufficient strength of mind to stifle their resentment. But we are not, therefore, to imagine the Catalan disposed to mischief; he is not so naturally. He works himself into a rage, and is loud, but seldom commits acts of violence. In a political point of view, the Catalan is restless and factious; he is for ever sighing for a liberty, or rather independence, which he has often attempted to acquire, and which has so frequently impelled him to take up arms. But, as devoted in his attachment, as terrible in his hatred, he is ready to make every sacrifice for a prince who knows how to gain his love.' This country formed the principal theatre of the revolutionary war against Buonaparte.

CATAMENIA, in medicine, from κατα, according to, and μην, the month, menses. The monthly discharge from the uterus of females after about the age of fourteen till near fifty. Although it has been much disputed, yet there can be but little doubt that it is a natural secretion, and not a rupture of the arteries in the uterus. During pregnancy, and while giving suck, if the person is in good health, the menses cease to flow. The discharge is commonly from five to six ounces, and last from three to five days. The use of this discharge is to lubricate the uterus, in order to render it fit for the reception of the fœtus, and after they have ceased, women rarely, if ever conceive.

CATANA, or Catina, in ancient geography, a town of Sicily, opposite to Ætna, on the south-east, one of the five Roman colonies; anciently built by the people of Naxos, seven years after the building of Syracuse, A. A.C. 728. It was the birth place of Charondas, the famous lawgiver. It is now called Catanea.

CATANANCHE, Candia lion's foot: a genus of the polygamia æqualis order, and syngenesia class of plants; natural order forty-ninth, compositæ: cal. imbricated; receptacle paleaceous; the pappus furnished with awns by caliculus of five stiff hairs. There are three species, of which the most remarkable is the C. cerulea which sends out many long, narrow, hairy leaves which are jagged on their edges like those of the buckshorn plantain, but broader. Each of the branches is terminated by single heads of flowers, of a fine blue color. It is a perennial plant, and may be propagated either by slips or seeds. The seeds ripen in August.

CATANIA, or Catanea, a city of Sicily, seated on the gulph, near the foot of Mount Ætna. It was founded by the Chalcidians, soon after the settlement of Syracuse, and enjoyed great tranquillity till Hiero I. expelled the citizens; and, after replenishing the town with a new stock of inhabitants, gave it the name of Ætna: immediately after his decease, it regained its ancient name, and the citizens returned to it. Catania fell into the hands of the Romans, among their earliest acquisitions in Sicily, and became the residence of a prætor. It was adorned with sumptuous buildings of all kinds, and every convenience was procured to supply the natural and artificial wants of life. It was destroyed by Pompey's son, but restored with superior magnificence by Augustus. The reign of Decius is famous in the history of this city, for the martyrdom of its patroness St. Agatha. On every emergency her intercession is implored. She is piously believed to have preserved Catania from being overwhelmed by torrents of lava, or shaken to pieces by earthquakes: yet its ancient edifices are covered by repeated streams of volcanic matter; and almost every house, even her own church, has been thrown to the ground. In the reign of William the Good, 20,000 Catanians, with their pastor at their head, were destroyed before the sacred veil could be properly placed to check the flames. In the last century, the eruptions and earthquakes raged with redoubled violence, and Catania was twice demolished. See Ætna. The prince of Biscari has been at great pains, and spent a large sum f money, in working down to the ancient town, hich, on account of the numerous torrents of lava, that have flowed out of Mount Ætna for these last thousand years, is now to be sought for in dark caverns, many feet below the present surface of the earth. Swinburne informs us, that he descended into baths, sepulchres, an amphitheatre, and a theatre, all very much injured by the various catastrophes that have befallen them. They were erected upon old beds of lava, and even built with square pieces of the same substance, which in no instance appears to have been fused by the contact of new lavas. The sciarra or stones of cold lava have constantly proved as strong a barrier against the flowing torrent of fire as any other stone could have been, though some authors were of opinion that the hot matter would melt the old mass, and incorporate with it. This city has been frequently defended from the burning streams, by the solid mass of its own ramparts, and by the air compressed between them and the lava; as appears by the torrent having stopped within a small distance of the walls, and taken another direction. But when the walls were broken or low, the lava collected itself till it rose to a great height, and then poured over in a curve. There is a well at the foot of the old walls of Catania, where the lava, after running along the parapet, and then falling forwards, has produced a very complete lofty arch over the spring. The church is a noble fabric. It is accounted the largest in Sicily, though neither a porch nor cupola has been erected, from a doubt of the solidity of the foundations, which are no other than the bed of lava that ran out of Ætna in 1669, and is supposed to be full of cavities. The organ is much esteemed by connoisseurs in musical instruments. Catania, in Mr. Swinburne's time, was reviving with great splendor. The harbour is at present considered as one of the best in Sicily, and the exports of wine, grain, oil, silk goods, and amber, are considerable. Population about 16,000. It is fifty-two miles south-west of Messina.

CATANZARO, a city of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and seated on a mountain near the Gulf of Squillace, forty-two miles south of Cosenza.

CATAPAN, or Catipan, from κατεπανω, captain, a name given by the Greeks, about the twelfth century, to the governor of their dominions in Italy.

CATAPELTA, an instrument of punishment among the ancients, consisting of a kind of press, composed of planks, between which the criminal was crushed to death.

CATAPHONICS, the science which investigates the properties of reflected sounds. See Acoustics.

CATAPHRACT, *n.* Lat *cataphracta*; καταφρακτος. A horseman in complete armor.

> On each side went armed guards,
> Both horse and foot; before him and behind,
> Archers and slingers, *cataphracts* and spears.
>
> *Milton.*

CATAPHRACTA, from κατα, and φρασσω, to arm; in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, fortified with iron scales or links, wherewith

sometimes only the breast, sometimes the whole body, and sometimes the horse too, was covered. It was in use among the Sarmatians, Persians, and other barbarians. The Romans also adopted it early for their foot; and, according to Vegetius, kept it till the time of Gratian, when the military discipline growing remiss, the Roman foot thought the cataphracts as well as the helmet too great a load to bear, and therefore threw both by, choosing rather to march against the enemy bare-breasted: by which, in the wars with the Goths, multitudes were destroyed.

CATAPHRACTÆ NAVES, ships armed and covered in fight, so that they could not be easily damaged by the enemy. They were covered over with boards or planks, on which the soldiers were placed to defend them; the rowers sitting underneath, thus screened from the enemy's weapons.

CATAPHRACTARII, or CATAPHRACTI EQUITES, were a sort of cuirassiers, not only fortified with armour themselves, but having their horses guarded with solid plates of brass or other metals, usually lined with skins, and wrought into plumes, or other forms. But their disadvantage was their unweildiness, by which, if once unhorsed, they were unable to rise, and thus fell a prey to the enemy.

CATAPHRYGIANS, a sect in the second century, so called from being originally of Phrygia. They were orthodox in everything, except that they took Montanus for a prophet, and Priscilla and Maximilla for true prophetesses, to be consulted in everything relating to religion; as supposing the Holy Spirit had abandoned the church. See MONTANIST.

CATAPLASM, *n.* A poultice; a moist, emollient application, to allay inflammation, and forward suppuration.

> I bought an unction of a mountebank,
> So mortal, that but dip a knife in it,
> Where it draws blood, no *cataplasm* so rare,
> Collected from all simples that have virtue
> Under the moon, can save. *Shakspeare.*

> The eloquence of the declaration, not contradicting, but enforcing sentiments of the truest humanity; has left stings that have penetrated more than skin deep into my mind; and never can they be extracted by all the surgery of murder; never can the throbbings they have created be assuaged by all the emollient *cataplasms* of robbery and confiscation. *Burke.*

CATAPUCE, *n.* French, *catapuce*. An old name for two species of plants; the palma christi, and the garden spurge, the former of which was called the great; the latter, the less.

> A day or two ye shal han degestives
> Of wormes or ye take your laxatives,
> Of laureola, centauria, and fumetere,
> Or elles of ellebor that groweth there,
> Of *catapuce* or of gaitre beries,
> Or erbe ive growing in our yard that mery is.
> *Chaucer's Canterbury Tales.*

CATAPULT, *n.* Lat. *catapulta; καταπυλτης*. An ancient warlike engine, described in the quotation, and more fully in the next article.

> The balista violently shot great stones and quarries; as also the *catapults*. *Camden.*

CATAPULT, or CATAPULTA, was also used for throwing arrows and darts upon the enemy. Some of these engines were of such force that they would throw stones of a hundred weight. Josephus takes notice of the surprising effects of them, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men from one end to the other, were the phalanx ever so deep. The base is composed of two large beams, 2, 3. The length of those beams is fifteen diameters of the bore of the capitals, 9. At the two extremities of each beam, two double mortises are cut to receive the eight tenons of two cross beams, each of them four of the diameters in length. In the centre of each of the beams of the base, and near two-thirds of their length, a hole perfectly round, and nineteen inches in diameter, should be bored: these holes must be exactly opposite to each other, and should increase gradually to the inside of the beams, so that each of them, being sixteen inches on the outside towards the capitals, 9, should be seventeen and a half at the opening on the inside, and the edges carefully rounded off. The capitals, 9, are, in a manner, the soul of the machine, and serve to twist and strain the cordage, which forms its principle or power of motion. The capitals are of cast brass or iron; each consisting of a wheel with teeth, C 10, of two inches and a half thick. The hollow or bore of these wheels should be eleven inches and a quarter in diameter, perfectly round, and the edges smoothed down. As the friction would be too great, if the capitals rubbed against the beams, by the extreme straining of the cordage, which draws them towards these beams, that inconvenience is remedied by the means of eight friction wheels, or cylinders of brass, about the thirteenth of an inch in diameter, and an inch and one-sixth in length, placed circularly, and turning upon axes, as represented at D 13, B 12. One of these friction wheels at large with its screw, by which it is fastened into the beam, is represented at A. Upon this number of cylindrical wheels the capitals, 9, must be placed in the beams, 2, 3, so that the cylinders do not extend to the teeth of the wheels, which must receive a strong pinion 14. By means of this pinion, the wheel of the capital is made to turn for straining the cordage with the key 15. The capital wheel has a strong catch 16, and another of the same kind may be added to prevent anything from giving way through the extreme and violent force of the strained cordage. The capital piece of the machine is a nut or cross pin of iron, 17, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts and is fixed in grooves about an inch deep. This piece, or nut, ought to be about two inches and one-third thick at the top, 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inserted in the capitals. After placing the two capitals in the holes of the two beams, in a right line with each other, and fixing the two cross diametrical nuts, or pieces over which the cordage is to wind, one end of the cord is reeved through a hole in one of the capitals in the base, and made fast to a nail within the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the cross pieces of iron in the centre of the two capitals till they are full, the cordage forming a large skain. The tension of the cordage ought to be exactly equal, that is, the several foldings of the cord over the capital pieces should be equally strained, and so near each other, as not to leave the least space between them. As soon as the first fold or skain of cord has filled up one whole space or breadth of the capital pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and the skain of cordage entirely fills them, observing to rub it from time to time with soap. At three or four inches behind the cordage, thus wound over the capital piece, two very strong upright beams, 21, are raised; these are posts of oak fourteen inches thick, crossed over at top by another of the same solidity. The height of the upright beams is seven and a half diameters; each supported behind with very strong props, 25, fixed at bottom in the extremities of the base 2, 3. The cross beam 24 is supported in the same manner by a prop in the centre. The tree, arm, or stylus, 22, should be of sound ash. Its length is from fifteen to sixteen diameters of the bore of the capitals. The end of the bottom, or that fixed in the middle of the skain, is ten inches thick, and fourteen broad. To strengthen the arm or tree, it should be wrapt round with a cloth dipped in strong glue, like the tree of a saddle, and bound very hard with waxed thread, of the sixth of an inch in diameter from the large end at bottom almost to the top, as represented in the figure. At the top of the arm, just under the iron hand or receiver 27, a strong cord is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the hook of a brass pulley 28 is put. The cord 29 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which serves as a stay, is then brought to it, and made fast by its hook to the extremity of the hand, 27, in which the body to be discharged is placed. The pulley at the neck of the arm is then unhooked; and when the trigger is to let it off, a stroke must be given upon it with an iron bar or crow of about an inch in diameter; on which the arm flies up with a force almost equal to that of a modern mortar. The cushion or stomacher, 23, placed exactly in the middle of the cross beam 24, should be covered with a tanned ox hide, and stuffed with hair, the arm striking against it with inconceivable force. It is to be observed, that the tree or arm, 22, describes an angle of ninety degrees, beginning at the cock, and ending at the stomacher or cushion. Some of the spears, &c. thrown by these engines, are said to have been eighteen feet long, and to have been thrown with such velocity as to take fire in their course In fig. 2 A B C D is the frame that holds the darts or arrows, which may be of different numbers, and placed in different directions. E F is a large and strong iron spring, which is bent by a rope that goes over three pullies, I, K, L; and is drawn by one or several men; this rope may be fastened to a pin at M. The rope, therefore, being set at liberty, the spring must strike the darts with great violence, and send them, with surprising velocity, to a great distance. This instrument differs in some particulars from the description we have of that of the ancients; principally in the throwing of several darts at the same time, one only being thrown by theirs. See Balista.

CATARACT, n. Fr. *cataracte*; Lat. *cataracta*; *καταῤῥάκτη*. A fall of water from an elevation; a shoot of water; a cascade; but the latter word is now more commonly applied to minor or artificial cataracts. Cataract formerly meant also a flood gate, and a portcullis.

> Blow, winds, and crack your cheeks; rage, blow!
> You *cataracts* and hurricanoes, spout
> Till you have drenched our steeples. *Shakespeare.*

> What if all
> Her stores were opened, and the firmament
> Of hell should spout her *cataracts* of fire?
> Impendent horrors! *Paradise Lost.*

> Go, fool, and teach a *cataract* to creep!
> Can thirst of empire, vengeance, beauty, wait?
> *Young's Brothers.*

> Too charming visions of intense delight!
> Why? whither vanish ye? Her eagle flight
> Fancy renews; and full athwart mine eye
> Throws an enormous *cataract*:—from on high
> In awful stillness deepening waters glide
> E'en to the rude rocks ridge abrupt, then slide
> Ponderous down, down, the void, and pitch below
> In thunders. *Bishop.*

> Nymphs! you from cliff to cliff attendant guide
> In headlong *cataracts* the impetuous tide;
> Or lead o'er wastes of Abyssinian sands,
> The bright expanse to Egypt's showerless lands.
> *Darwin.*

> O paragon of cats, whose loss distracts
> My soul, and turns my tears to *cataracts*,
> Nor craft nor courage could thy doom prorogue.
> *Huddesford.*

Ca'taract, n. This word, in its medical sense of a disorder in the eye, has been derived from the same root as the former word. Cleland, however, and with apparent reason, contends that it is only a barbarous formation of the words cakoeroc or cacoeroco, still in use in the southern parts of France; the meaning of which is a speck, or any gathering over the eye.

> Saladine (celandine), hath a yellow milk, which hath likewise much acrimony; for it cleanseth the eyes: it is good also for *cataracts*. *Bacon.*

Cataract, in hydrography, is occasioned by a precipice in the channel of a river, caused by rocks or other obstacles, stopping the course of the stream, from whence the water falls with a greater noise and impetuosity. Such are the cataracts of the Nile, the Danube, Rhine, &c. In that of Niagara, the perpendicular fall of the water is 137 feet; and in that of Pistill Rhaiadr, in North Wales, the fall of water is nearly 240 feet from the mountain to the lower pool. Strabo calls that a cataract which we call a cascade; and what we call a cataract, the ancients usually called catadupa. Herminius has an express dissertation, De Admirandis Mundi Cataractis, Supra et Subterraneis: where he uses the word in a new sense; signifying, by cataract, any violent motion of the elements.

Cataract is defined a disorder of the humors of the eye, by which the pupil, that ought to appear transparent and black, looks opaque, blue, gray, brown, &c. whereby vision is variously impeded, or totally destroyed. See Surgery.

CATA'RRH, *n.*
Cata'rrhal, *adj.*
Cata'rrhous, *adj.*
Fr. *catarre;* old Fr. *catarrhe;* from καταῤῥέω, *defluo.* A defluxion of sharp serum from the glands about the head and throat; a species of that disorder which is familiarly termed a cold. See Medicine, Index. The adjectives signify that which relates to, or proceeds from, a catarrh.

All feverous kinds,
Convulsions, epilepsies, fierce *catarrhs.*
Paradise Lost.

Neither was the body then subject to die by piecemeal, and languish under coughs, *catarrhs,* or consumptions. *South.*

The *catarrhal* fever requires evacuations. *Floyer.*

Old age attended with a glutinous, cold, *catarrhous,* leucophlegmatick constitution. *Arbuthnot.*

Cat-grandams vexed with asthmas and *catarrhs,*
And superstitious cats who curse their stars.
Huddesford.

CATASTASIS, in poetry, the third part of the ancient drama; being that wherein the intrigue, or action, set forth in the epitasis, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scaliger defines it, the full growth of the fable, while things are at a stand in that confusion to which the poet has brought them.

CATASTROMA, in ancient ships of war, a sort of scaffold on the head and stern, whereon the soldiers were posted.

CATA'STROPHE, *n.* Fr. *catastrophe;* καταστροφη. The unravelling of a plot; the winding up of a story or play; the issue or conclusion of an event; a fatal event; death.

Pat! he comes like the *catastrophe* of the old comedy. *Shakspeare.*

That philosopher declares for tragedies, whose *catastrophes* are unhappy, with relation to the principal characters. *Dennis.*

Here was a mighty revolution, the most horrible and portentous *catastrophe* that nature ever yet saw; an elegant and habitable earth quite shattered.
Woodward.

Cats of each class, craft, calling, and degree,
Mourn Dick's calamitous *catastrophe.* *Huddesford.*

Catastrophe, in the ancient dramatic poetry, the fourth and last part, or that immediately succeeding the catastasis: or, according to others, the third only; the whole drama being divided into protasis, epitasis, and catastrophe; or in the terms of Aristotle, prologue, epilogue, and exode. The catastrophe clears up everything, and is the discovery or winding up of the plot. It has its peculiar place: for it ought entirely to be contained, not only in the last act, but in the very conclusion of it; and when the plot is finished, the play should be so also.

CATAWESSY, or Hughesburg, a town of Pennsylvania, in Northumberland county, situated at the mouth of the Catawessy creek, on the east branch of the Susquehannah, twenty-five miles E.N.E. of Sunbury, and 100 north-west of Philadelphia.

CATCH, *v.* & *n.*
Ca'tchable, *adj.*
Ca'tcher, *n.*
Ca'tchpenny, *n.* & *adj.*
Ca'tchpole, *n.*
Ca'tchword, *n.*
This word has many claimants for its origin. Junius, in the most peremptory terms, refers it to the Greek: Κατεχειν (says he) quod detinere, obtinere, occupare, significat: mutuatur sua tempora ab inus. thema te Κατασχειν, unde *catch* contractum esse nemo non videt. Serenius, without any comment, points out to us, Su. *katza;* an instrument for catching fish. Minsheu resorts to Ital. *caccia; cacciare;* the chase; to hunt; aud Mr. Todd suggests, that the word may, perhaps, be derived from the substantive cat, as that creature seizes suddenly on its prey. The meanings of the verb and noun are numerous. The power of stopping that which is in motion, and of retaining after having stopped, is the primary idea. The verb, in its active sense, signifies to lay hold on with the hand; to stop anything in its flight; to seize by pursuing; to stop anything falling; to ensnare or entrap; to receive suddenly; to seize suddenly, eagerly, unexpectedly; to gain the affections; to charm; to receive any contagion or disease. Catching at, is a sudden endeavour to seize; catching up, is snatching; catching a Tartar, is to be taken at the moment when we are expecting to take. In the neuter sense the verb denotes, to be contagious; to lay hold suddenly. The noun is expressive of seizure; watching to seize; an advantage taken; quick taking; the thing caught; profit; advantage; a short interval of action; anything that catches; a small swift-sailing ship, often written ketch; and, lastly, a peculiar species of musical composition. Catchable is liable to be caught. A catchpenny is a worthless publication; whether it be a silly journey to the north, a novel, a lampoon, or a piece of doggrel. A catchpole is a serjeant; a bum-bailiff. A catchword is the last word at the corner of a page, under the last line.

And when he arose against me, I *caught* him by his beard, and smote him, and slew him.
1 *Sam.* xvii. 35.

And they sent unto him certain of the Pharisees and of the Herodians, to *catch* him in his words.
Mark, xii. 13.

The mule went under the thick boughs of a great oak, and his head *caught* hold of the oak.
2 *Sam.* xvii. 19.

To *catch* something out of his mouth that they might accuse him. *Luke,* xi. 54.

And in the meen whils that Beryn thus gan pleyn,
A *cachepoll* stode besides, his name was Machaign,
And herd all the wordes, and knew also tofore
How Beryn was tormented both with las and more.
Chaucer's Canterbury Tales.

Taught by his open eye,
His eye, that even did mark her trodden grass,
That she would fain the *catch* of Strephon fly.
Sidney.

I saw him run after a gilded butterfly, and, when he *caught* it, he let it go again; and after it again; and over and over he comes, and up again: and *caught* it again. *Shakspeare.*

I've perused her well;
Beauty and honour in her are so mingled,
That they have *caught* the king. *Id.*

Those measles,
Which we disdain should tetter us, yet seek
The very way to *catch* them. *Id.*

Saucy lictors
Will *catch at* us like strumpets, and scald rhimers
Ballad us out of tune. *Id.*

'Tis time to give them physic, their diseases
Are grown so *catching*. *Id.*

This is the tune of our *catch*, played by the picture of nobody. *Id.*

Here Hector shall have a great *catch*, if he knock out your brains; he were as good crack a fusty nut with no kernel. *Id.*

All which notions are but ignorant *catches* of a few things, which are most obvious to men's observations. *Bacon.*

Several quires, placed one over against another, and taking the voice by *catches* anthemwise, give great pleasure. *Id.*

Catchpoll, though now it be used as a word of contempt, yet, in ancient times, it seems to have been used without reproach, for such as we now call serjeants of the mace, or any other that uses to arrest men upon any cause. *Cowell.*

Here she comes, but with a look
Far more *catching* than my book. *Marvell.*

Scallops will move so strongly, as oftentimes to leap out of the *catcher*, wherein they are *caught*. *Grew.*

We retain a *catch* of those pretty stories, and our awakened imagination smiles in the recollection. *Glanville.*

The curling smoke mounts heavy from the fires,
At length it *catches* flame, and in a blaze expires. *Dryden.*

For I am young, a novice in the trade,
The fool of love, unpractised to persuade,
And want the soothing arts that *catch* the fair,
But *caught* myself, lie struggling in the snare. *Id.*

Fate of empires, and the fall of kings,
Should turn on flying hours and *catch* of moments. *Id.*

These artificial methods of reasoning are more adapted to *catch* and entangle the mind, than to instruct and inform the understanding. *Locke.*

It has been writ by *catches*, with many intervals. *Id.*

Others, to *catch* the breeze of breathing air,
To Tusculum or Algido repair. *Addison.*

Both of them lay upon the *catch* for a great action. *Id.*

Or call the winds through long arcades to roar,
Proud to *catch* cold at a Venetian door. *Pope.*

A shepherd diverted himself with tossing up eggs, and *catching* them again. *Spectator.*

The eagerness of a knave makes him often as *catchable*, as the ignorance of a fool. *Lord Halifax.*

Another monster,
Sullen of aspect, by the vulgar called
A *catchpoll*, whose polluted hands the gods
With force incredible and magic charms
Erst have endued, if he his ample palm
Should haply on ill-fated shoulder lay
Of debtor. *Philips.*

Sonnets or elegies to Chloris
Might raise a house about two stories;
A lyric ode would slate; a *catch*
Would tile; an epigram would thatch. *Swift.*

Now twenty springs had clothed the park with green
Since Lydia knew the blossoms of fifteen,
No lovers now her morning hours molest,
And *catch* her at her toilette half undrest. *Gay.*

When poor Alicia's maddening brains are racked,
And strongly imaged griefs her mind distract,—
Struck with her grief, I *catch* the madness too!
My brain turns round, the headless trunk I view. *Churchill.*

Hear, thou, of heaven unconscious! From the blaze
Of glory stream'd from Jove's eternal throne
Thy soul, O mortal, *caught* the inspiring rays
That to a god exalt earth's raptured son. *Beattie.*

CATCH, in the musical sense of the word, a fugue in the unison, wherein, to humor some conceit in the words, the melody is broken, and the sense interrupted in one part, and caught again or supported by another. Mr. Jackson defines a catch, 'a piece for three or more voices, one of which leads, and the others follow in the same notes. It must be so contrived, that rests (which are made for that purpose) in the music of one line be filled up with a word or two from another line; these form a cross purpose, or catch, from whence the name.

CATCHFLY. See LYCHNIS and SILENE.

CATECHESIS, an instruction given any person in the first rudiments of an art or science; but more particularly of the Christian religion. In the ancient church it was an instruction given *vivâ voce*, either to children or adult heathens, preparatory to their receiving baptism.

CA'TECHISE, *v.*
CATECHISA'TION, *n.*
CA'TECHISER, *n.*
CA'TECHISING, *n.*
CA'TECHISM, *n.*
CA'TECHIST, *n.*
CATECHI'STICAL, *adj.*
CATECHI'STICALLY, *adv.*
CATECHE'TICAL, *adj.*
CATECHE'TICALLY, *adv.*
CATECHE'TICK, *adj.*
CATECHU'MEN, *n.*
CATECHUME'NICAL, *adj.*
CATECHU'MENIST, *n.*

Κατηχέω. The root of this word is Ηχως, *echo*, *sonus*, *repetitio*; because in catechising the thing is repeated, resounded. To catechise is to instruct by asking questions, and correcting the answers; to question; to interrogate. Catechism, in its oldest sense, denotes a form of religious instruction, by question and answer; but it is now applied to books written in the interrogative manner, upon any subject. Catechist and catechiser are synonymous, and signify the person who interrogates. Catechising and catechisation are also equivalent terms, to express the act of interrogation. That which consists of, or instructs by, questions and answers, is described by the adjectives catechetic, catechetical, and catechistical. Catechumen, and catechumenist (the latter word is of rare occurrence), signify one who has not yet gone beyond the first rudiments of Christianity; the lowest order of Christians in the primitive church. See CATECHUMENS.

I will *catechise* the world for him, that is, make questions, and bid them answer. *Shakspeare.*

Why, then, I suck my teeth, and *catechise*
My piked man of countries. *Id.*

Ways of teaching there have been sundry always usual in God's church, for the first introduction of youth to the knowledge of God, the Jews even to this day have their *catechisms*. *Hooker.*

Hark you, good Maria,
Have you got a good *catechiser* here?
Beaumont and Fletcher.

None of years and knowledge was admitted, who had not been instructed by the *catechist* in this foundation, which the *catechist* received from the bishop. *Hammond.*

He had no *catechism* but the creation, needed no study but reflection, and read no book but the volume of the world. *South.*

Could turn the Covenant, and translate
The Gospel into spoons and plate;
Expound upon all merchants' cases,
And open the intricatest places;
Could *catechise* a money-box,
And prove all pouches orthodox. *Butler.*

The prayers of the church did not begin in St. Austin's time, till the *catechumens* were dismissed. *Stillingfleet.*

Socrates introduced a *catechetical* method of arguing; he would ask his adversary question upon question, till he convinced him, out of his own mouth, that his opinions were wrong. *Spectator.*

There flies about a strange report,
Of some express arrived at court,
I'm stopped by all the fools I meet,
And *catechised* in every street. *Swift.*

Catechism, in its primary sense, signifies an instruction in the principles of the Christian religion, delivered vivâ voce, so as to require frequent repetitions from the disciple or hearer. Anciently the candidates for baptism were thus instructed in the principles of religion.

Catechist denotes a person appointed to instruct those intended for baptism, by word of mouth, in the fundamental articles of Christianity. The catechists of the ancient churches were ministers usually distinct from the bishops and presbyters, and had their catechumena or auditories apart. But they did not constitute any distinct order of the clergy, being chosen out of any order. The bishop himself sometimes performed the office; at other times presbyters, readers, or deacons. Origen was made catechist at Alexandria when only eighteen years of age, and consequently incapable of the deaconship.

CATECHU, in botany. See Mimosa.

Catechumens, in church history, had a title to the common name of Christians, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to this state by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens as soon as they were capable of instruction; but at what age those of heathen parents were admitted is not so clear. As to the time of their continuance in this state, there were no general rules; but the practice varied according to the difference of times and places, and the proficiency of the catechumens. There were four degrees of catechumens; the first were those instructed privately without the church, and kept for some time from the privilege of entering it, to make them the more desirous of it. The next were the audientes, so called from their being admitted to hear sermons, and the Scriptures read in the church, but not allowed to partake of the prayers. The third were the genuflectentes, so called because they received imposition of hands kneeling. The fourth were the competentes and electi, denoting the immediate candidates for baptism, appointed to be baptised at next festival. These, after examination, were exercised for twenty days together, and were obliged to fasting and confession. some days before baptism they were veiled; and it became customary to touch their ears, saying, 'Ephatha,' i. e. be opened; also to anoint their eyes with clay, in pretence of imitating our Saviour's practice.

CATECHUMENUM; 1. A name given to an upper gallery in the churches: 2. A sort of school-house near the church, where the catechumens met to receive the instructions of the catechists.

CATEGAT, sometimes called the Sound, an entrance into the Baltic from the German Ocean, running between Denmark, Jutland, Sweden, and Norway.

CATEGORIARES, a minister in the Greek church, whose business is to proclaim the feast-days, take care of the lights, &c.

CATEGORY, *n.*
Catego'rical, *adj.*
Catego'rically, *adv.*
} Κατηγορία; the root is by some supposed to be Αγορα, *forum*, the bar; an harangue; others find it in κατα and ἀγείρω, *congrego*, *colligo*, which seems to be the most rational opinion. A category is a class; rank; order of ideas; predicament. See the next article. Categorical denotes absolute; adequate; positive; equal to the thing to be expressed. Categorically is directly; expressly; positively; plainly. Give me a categorical answer, or, answer me categorically, means, give me a plain, full, and final answer.

The king's commissioners desired to know, whether the parliament's commissioners did believe that bishops were unlawful? They could never obtain a *categorical* answer. *Clarendon.*

I dare affirm, and that *categorically*, in all parts wherever trade is great, and continues so, that trade must be nationally profitable. *Child.*

The absolute infinitude, in a manner, quite changes the nature of beings, and exalts them into a different *category*. *Cheyne.*

A single proposition, which is also *categorical*, may be divided again into simple and complex. *Watts.*

— Prudes, who when they're asked the question,
squall,
And ne'er give answer *categorical*. *Huddesford.*

Category, in logic, a series of all the attributes contained under any genus. The ancient philosophers distributed all the objects of our thoughts and ideas into certain genera or classes, not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know. These classes the Greeks called categories, and the Latins predicaments. Aristotle made ten categories, comprehending under the first all substantives; and all accidents under the nine last, viz. quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

Arbor, sex, servos, ardore, refrigerat, ustos,
Rure cras stabo, nec tunicatus ero.

CATEIA, in ancient writers, a kind of javelin, used among the ancient Gauls and Germans, made heavy, and therefore not fitted to fly far, but doing great execution where it did reach; and having an apparatus by which the person who threw it might draw it back again. It is mentioned by Virgil, Æn. lib. vii. ver. 741.

CATENARY, in the higher geometry, is a curve line formed by a cord hanging freely from two points of suspension, whether the points be horizontal or not. It is otherwise called the elastic curve. The nature of this curve was sought after by Galileo, who thought it was the same with the parabola; but though Jungius detected this mistake, its true nature was not discovered till 1691, in consequence of M. John Bernouilli having published it as a problem in the Acta Eruditorum, to the mathematicians in Europe. In 1697 Dr. D. Gregory published an investigation of its properties, which before had been discovered by Bernouilli and Leibnitz. This curve is of the mechanical kind, and cannot be expressed by a finite algebraical equation in simple terms of its abciss and ordinate. The investigation of the nature and chief properties of this curve will be found under the article FLUXIONS.

CA'TENATE, *v.*
CATENA'RIAN, *adj.*
CATENA'TION, *n.*

Lat. *catena*. To catenate is to chain; to link together, either mentally or physically. The noun signifies link; regular connexion; the adjective, having a relation or resemblance to a chain; but it is rarely, if ever, used, except as descriptive of a peculiar geometrical curve. See the preceding article.

This *catenation* or conserving union, whenever his pleasure shall divide, let go, or separate, they shall fall from their existence. *Browne.*

In geometry, the *catenarian* curve is formed by a rope or chain hanging freely between two points of suspension. *Harris.*

The back is bent after the manner of the *catenarian* curve, by which it obtains that curvature that is safest for the included marrow. *Cheyne.*

CA'TER, *v.* & *n.*
CATE, *n.*
CA'TERER, *n.*
CA'TERESS, *n.*
CA'TERY, *n.*

Fr. *queter*; It. *accatare*; Sp. *catar*; Ger. *kaufen*; Ang.-Sax. ceapian; aceapian; Goth. *kates*. The noun cate, which Dr. Johnson erroneously represents as having no plural, Skinner conjectures to be a contraction of the word delicates. But Mr. Todd more happily considers it it as a variation of the antiquated English word acates, which he derives from the old Fr. acat, achat, purchase. Both the English words however, are probably from the Goth. Cates, are viands, food; and almost uniformly denote something more delicate than usual. To cater is to provide victuals; the cater, caterer, or cateress, is the provider; and catery was formerly a name of the larder or pantry. The four of cards and dice is called cater; but this is a corruption of the Fr. quatre.

The dearest *cates* are best; and 'tis an ordinary thing to bestow twenty or thirty pounds on a dish, some thousand crowns upon a dinner. *Burton. Anat. Mel.*

Well, say what *cates* you have,
For soldiers' stomachs always serve them well.
Shakspeare.

He that doth the ravens feed,
Yea providently *caters* for the sparrow.
Be comfort to my age. *Id.*

The fair acceptance, sir, creates
The entertainment perfect, not the *cates*.
B. Jonson.

O wasteful riot, never well content,
With low-prized fare; hunger ambitious
Of *cates*, by land and sea far-fetched and sent.
Raleigh.

The oysters dredged in this Lyner, find a welcomer acceptance, where the taste is *cater* for the stomach, than those of the Tamar. *Carew's Cornwall.*

He made the greedy ravens to be Elias's *caterers*, and bring him food. *King Charles.*

Impostor! do not charge most innocent nature,
As if she would her children should be riotous
With her abundance: she, good *cateress*,
Means her provision only to the good. *Milton.*

Alas! how simple to these *cates*,
Was that crude apple that diverted Eve! *Id.*

Seldom shall one see in cities and courts that athletic vigour, which is seen in poor houses, where nature is their cook, and necessity their *caterer*. *South.*

They, by the alluring odour drawn, in haste
Fly to the dulcet *cates*, and crowding sip
Their palatable bane. *Philips.*

Near him Retirement, pointing to the shade,
And Independence, stood: the generous pair
That simple life, the quiet-whispering grove,
And the still raptures of the free-born soul,
To *cates* prefer by virtue bought, not earned.
Thomson.

Fastidious cats who pine for costly *cates*.
Huddesford.

CA'TER-COUSIN, a corruption of quatre-cousin; from the ridiculousness of claiming affinity with so remote a degree.

His master and he, saving your worship's reverence, are scarce *cater-cousins*. *Shakespeare.*

CA'TERPILLAR. 'This word,' says Johnson, 'Skinner, and Minsheu are inclined to derive from chatte peleuse, a weasel. It seems easily deducible from *cates*, food; and *piller*, Fr. to rob; the animal that eats up the fruits of the earth.' It appears evident either that there is a typographical error in the dictionary of the great lexicographer, or that he has overlooked the real meaning of Skinner and Minsheu, which seems simply to be that the insect is hairy like a cat. That 'weasel' is a press error, is rendered almost certain by the fact that chatte peleuse never designated that animal, but has always been an appellation of the weevil. The caterpillar is a well-known insect, which is a potent destroyer of vegetation. The name is given to anything that is voracious and useless.

The *caterpillar* breedeth of dew and leaves; for we see infinite *caterpillars* breed upon trees and hedges, by which the leaves of the trees or hedges are consumed. *Bacon.*

Auster is drawn with a pot pouring forth water with which descend grasshoppers, *caterpillars*, and creatures bred by moisture. *Peacham.*

And what's a butterfly at best,
He's but a *caterpillar* drest;
And all thy race (a numerous seed)
Shall prove of *caterpillar* breed. *Gay.*

CATERPILLAR, in zoology, is the name of all winged insects, while in their reptile or worm state

CATESBÆA, the lily-thorn: a genus of the monogynia order, and tetandria class of plants; natural order twenty-eighth, luridæ: cor. is monopetalous, funnel-shaped, very long above the receptacle of the fruit; the stam. are within its throat; the fruit a polyspermous berry. There are two species; the principal is C. spinosa, a native of the island of Providence.

CATFISH, *n.* The name of a sea-fish in the West Indies, so named from its round head and large glaring eyes, by which they are discovered in hollow rocks. See Squalus.

CATGUT, a denomination given to small strings for fiddles, and other instruments, made of the intestines of sheep or lambs, dried and twisted together, either singly, or several together. These are sometimes colored red, sometimes blue, but are commonly left whitish or brownish, the natural color of the gut. They are also used by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other countries, from Lyons and Italy.

CATHARINE (St.), a virgin of Alexandria, celebrated for her learning as well as piety, who is said to have suffered martyrdom under the emperor Maximin, about A. D. 236. Her body being afterwards discovered on Mount Sinai, gave rise to the order of Knights of St. Catharine. There are also two other saints of this name; but their history will be more fit for the pages of a Romish calendar than for those of an encyclopædia.

Catharine (St.), Fraternity of, at Sienna, a religious society instituted in that city, in honor of St. Catharine, whose wedding ring, said to have been presented to her by our Saviour, is still preserved as a valuable relic. This fraternity yearly endows a certain number of destitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the same number of debtors, by paying their debts.

Catharine (St.), of Mount Sinai, Knights of, an ancient military order, erected for the assistance and protection of the numerous pilgrims who went to pay their devotions to the body of St. Catharine, on mount Sinai. Travelling being very dangerous, by reason of the Arabs, an order of knighthood was erected in 1063, on the model of that of the holy sepulchre, and under the patronage of St. Catharine: the knights of which obliged themselves by oath to guard the body of the saint, keep the roads secure, observe the rule of St. Basil, and obey their grand master. Their habit was white, and on it were represented the instruments of martyrdom whereby the saint had suffered; viz. a half wheel armed with spikes, and traversed with a sword stained with blood.

Catharine (St.), Order of, an order of ladies of the first quality in the Russian court, instituted in 1714, by Catherine, wife of Peter the Great, in memory of his signal escape from the Turks, in 1711. The ensigns of this order are a red cross, supported by a figure of St. Catharine, and fastened to a scarlet string edged with silver, on which are inscribed the name of St. Catharine, and the motto 'Pro fide et patria.'

CATHARINENSTADT, the head of the German colonies on the Wolga in European Russia, government of Saratov. It contains one long street, with eight smaller ones running off at right angles, and a small fortress to protect it against the attacks of the Tartars. Grain, tobacco, and cattle are the productions of the neighbourhood.

CAT-HARPINGS, *n.* Small ropes in a ship, running in little blocks from one side of the shrouds to the other, near the deck; they belong only to the main shrouds; and their use is to force the main shrouds tight, for the ease and safety of the masts, when the ship rolls.

CATHA'RTICAL, *adj.*
Catha'rtic, *adj.*
Catha'rticalness.

Καθαρτικὸς, from κατα and αἴρω, *tollo*. Purging medicines; purging; having a purging quality. The vermicular or peristaltick motion of the gut, says Quincy, continually helps on their contents from the pylorus to the rectum; and every irritation either quickens that motion in its natural order, or occasions some little inversions in it. In both, what but slightly adheres to the coats will be loosened, and they will be more agitated and thus rendered more fluid. By this only it is manifest, how a *cathartic* hastens and increases the discharges by stool; but where the force of the stimulus is great, all the appendages of the bowels, and all the viscera in the abdomen, will be twitched; by which a great deal will be drained back into the intestines, and made a part of what they discharge.

Quicksilver precipitated either with gold, or without addition, into a powder, is wont to be strongly enough *cathartical*. *Boyle.*

Lustrations and *cathorticks* of the mind were sought for, and all endeavour used to calm and regulate the fury of the passions. *Decay of Piety.*

The piercing causticks ply their spiteful power,
Emeticks ranch, and keen *catharticks* scour. *Garth.*

Plato has called mathematical demonstrations the *catharticks* or purgatives of the soul.
Addison's Spectator.

Cathartics. See Materia Medica.

CA'THEAD, *n.*, a kind of fossil.

The nodules with leaves in them, called *catheads*, seem to consist of a sort of iron stone, not unlike that which is found in the rocks near Whitehaven in Cumberland, where they call them catscaups.
Woodward on Fossils.

Cat-heads, two strong short beams of timber, which project almost horizontally over the ship's bows on each side of the bowsprit; being like two radii which extend from a centre taken in the direction of the bowsprit. That part of the cat-head which rests upon the forecastle, is securely bolted to the beams: the other part projects like a crane as above described, and carries in its extremity two or three small wheels or sheaves of brass or strong wood, about which a rope called the cat-fall passes, and communicates with the cat-block, which also contains three sheaves. The machine formed by this combination of pullies is called the cat, which serves to pull the anchor up to the cat-head, without tearing the ship's sides with its flukes. The cat-head also serves to suspend the anchor clear of the bow, when it is necessary to let it go: it is supported by a sort of knee, which is generally ornamented with sculpture. The cat block is filled with a large and strong hood, which catches the ring of the anchor when it is to be drawn up.

CATHEDRA, Καθηδρα, Gr. a chair, is used for, 1. a professor's chair; 2. a preacher's pulpit; and 3. a bishop's see, or throne, in a church.

CATHE'DRAL, *n* & *adj.* } Καθεδρα, a seat,
CATHE'DRATED, *adj.* } or chair, from κατα and εδρα, a seat. The noun signifies the head church of a diocese. The adjective denotes episcopal; containing a bishop's see; appertaining to an episcopal church; and, adds Johnson, though doubtingly, 'in low phrase, antique, venerable, old.' He gives the subjoined quotation from Pope, as illustrative of this sense of the word. But it seems probable that Pope had no such meaning. He is describing long alleys of trees, and apparently alludes to the resemblance which their tall equidistant trunks and overarching branches bear to the aisles of a Gothic cathedral. His friend Warburton considers Gothic architecture as having originated in an imitation of a grove of trees. Cathedrated denotes relating to the chair, or authority, of a teacher; but is obsolete.

A *cathedral* church is that wherein there are two or more persons, with a bishop at the head of them, that do make, as it were, one body politick. *Ayliffe's Parergon.*

Methought I sat in seat of majesty,
In the *cathedral* church of Westminster. *Shakspeare.*

Nature in vain us in one land compiles,
If the *cathedral* still shall have its aisles. *Marvell.*

If his reproof be private or with the *cathedrated* authority of a prælecter or publick reader. *Whitlock.*

His constant and regular assisting at the *cathedral* service was never interrupted by the sharpness of weather. *Locke.*

Here aged trees *cathedral* walks compose,
And mount the hill in venerable rows;
There the green infants in their beds are laid. *Pope.*

There is nothing in Leghorn so extraordinary as the *cathedral*, which a man may view with pleasure after he has seen St. Peter's. *Addison.*

Who can forsake thy walls and not admire
The proud *cathedral* and the lofty spire. *Gay.*

CATHEDRAL. The name seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive Christians. In these, the presbyterium; at their head was the bishop who held the place of chairman, cathedralis, or cathedraticus; and the presbyters, who sat on either side also called by the ancient fathers, assessores episcoporum. The episcopal authority did not reside in the bishop alone; but in all the presbyters, whereof the bishop was president. A cathedral, therefore, originally was different from what it is now; the Christians, till the time of Constantine, having no liberty to build any temple; by their churches they only meant their assemblies; and, by cathedrals, nothing more than consistories.

CATHERINE I. empress of Russia, a woman who rose from the lowest to the highest rank in life, was the natural daughter of a peasant, and born at Ringen, a small village in Livonia, April the 5th, 1687. Her original name was Martha, which she changed for Catherine when she embraced the Greek religion. Count Rosen, a lieutenant-colonel in the Swedish service, the proprietor of the village, supported, according to the custom of the country, both the mother and the child; and was supposed by many to have been her father. She lost her mother when she was only three years old; and, as the count died about the same time, she was left in so destitute a situation, that the parish-clerk of the village took her into his house. Soon afterwards, M. Gluck, Lutheran minister of Marienburgh, took her under his protection, brought her up in his family, and employed her in attending his children. In 1701, about the fourteenth year of her age, she espoused a dragoon of the Swedish garrison of Marienburgh: who, according to some writers, lived only eight days with her. It is certain that he was absent when Marienburgh surrendered to the Russians; and Catherine never saw him more. General Baur, upon the surrender of Marienburgh, being smitten with her beauty, took the young bride to his house, where she superintended his domestic affairs, and was supposed to be his mistress. Soon afterwards she was removed into the family of prince Menzikof, who was no less struck with her charms. With him she lived until 1704; when, in the seventeenth year of her age, she became the mistress of Peter the Great, and won so much upon his affections, that he espoused her on the 29th of May, 1711, at Jawerof in Poland; and on the 20th of February, 1712, the marriage was publicly solemnised at Petersburg. Catherine, by the most unwearied assiduity and unremitted attention, by the softness and complacency of her disposition, but above all by an extraordinary liveliness and gaiety of temper, acquired a wonderful ascendancy over the mind of the czar; and the emperor particularly specified her behaviour at Pruth, in which she alone prevailed with him to sign a truce, as one of the reasons which induced him to crown her publicly at Moscow with his own hand. This ceremony was performed in 1724. On the death of Peter in 1725 she ascended the throne as his successor. Her favorite, prince Menzikof, chiefly managed the public affairs during her short reign, which terminated by her death in a fit of apoplexy, May, 1727. The empress Elizabeth, who afterwards succeeded to the throne, was one of her daughters by Peter I.

CATHERINE II. of Russia, a queen who doubless has a claim to be ranked among the great sovereigns of Europe, according to the usual acceptation of the word greatness, was the daughter of Christian Augustus, prince of Anhalt-Zerbst. She was born, May the 2d, 1729, and baptised Sophia Augusta; but, upon her marriage with the grand duke of Russia, September the 1st, 1745, and admission into the Greek church, she assumed the name of Catherine. Her husband, Peter III. succeeded his aunt Elizabeth, January the 5th, 1762, but had not reigned six months, when he fell a sacrifice to his wife's ambition; being deposed on the 28th of June, and barbarously murdered on the 9th of July following. Upon the deposition of her unfortunate husband, Catherine II. was proclaimed empress of all the Russias; and soon after endeavoured to conceal the crimes by which she ascended the throne, by the dazzling lustre of some of those actions which have blotted the

e custom of the country, both the mother as
e child; and was supposed by many to have
en her father. She lost her mother when she
as only three years old; and, as the count died
out the same time, she was left in so destitute
situation, that the parish-clerk of the village
ok her into his house. Soon afterwards, M.
luck, Lutheran minister of Marienburgh, took
r under his protection, brought her up in his
nily, and employed her in attending his chil-
en. In 1701, about the fourteenth year of her
e, she espoused a dragoon of the Swedish gar-
on of Marienburgh: who, according to some
iters, lived only eight days with her. It is
rtain that he was absent when Marienburgh
rrendered to the Russians; and Catherine
ver saw him more. General Baur, upon the
render of Marienburgh, being smitten with
beauty, took the young bride to his house,
ere she superintended his domestic affairs,
l was supposed to be his mistress. Soon
erwards she was removed into the family of
nce Menzikof, who was no less struck with
charms. With him she lived until 1704;
en, in the seventeenth year of her age, she be-
e the mistress of Peter the Great, and won so
ch upon his affections, that he espoused her
the 29th of May, 1711, at Jaweroff in Poland;
on the 20th of February, 1712, the marriage
publicly solemnised at Petersburg. Cathe-
, by the most unwearied assiduity and unre-
ed attention, by the softness and complacency
er disposition, but above all by an extraordi-
liveliness and gaiety of temper, acquired a
derful ascendancy over the mind of the czar;
the emperor particularly specified her be-
iour at Pruth, in which she alone prevailed
him to sign a truce, as one of the reasons
ch induced him to crown her publicly at
cow with his own hand. This ceremony
performed in 1724. On the death of Peter
725 she ascended the throne as his successor,
favorite, prince Menzikof, chiefly managed
public affairs during her short reign, which
inated by her death in a fit of apoplexy,

page of history with blood in all ages of the world, and have too long employed the pens of historians and poets. The history of these transactions will be found under the article Russia; but future historians will decide, whether the great exploits, displayed during her reign, are not more to be ascribed to the natural strength of the empire, the force of which it was her business to collect and concentrate, than to any superior personal genius which she possessed. As to the justice of these exploits, it need hardly be left to posterity to judge. Without entering into the merits of her claims upon the Turkish dominions, her invasion and partition of Poland, in conjunction with other powers, particularly the king of Prussia, affords as flagrant an instance of the violation of the rights of nations, by open and unprovoked robbery and murder, as is to be found in the annals of the most barbarous savages. In short, the chief merit of Catherine, as a sovereign, seems like that of queen Elizabeth of England, to have consisted in selecting able ministers, admirals, and generals, to carry on the operations she had planned. In this respect, even her vices as a woman, which gave her the ascendant of an imperious character over her favorites, exempt from the weakness of sentiment, supplied the place of public virtues; and banished from her government the degrading influence, which courtiers elsewhere often exercise. She at last, however, allowed herself to be ruled by her freed man, Sabor, who deceived her with regard to the state of her forces, which did not amount to 200,000 men, though her military lists contained 400,000: and her long preparations for the field terminated in a disastrous war in Persia, by which two of her armies were consumed. If her policy in relation to Austria and Poland was attended with success, it is, perhaps, less to be ascribed to her interference, than to the good sense she displayed in allowing her ministers to govern. Yet this policy was over-reached in her last war against the Turks, when, in spite of pompous promises, assisting Austria only with feeble succours, and suddenly finding her squadrons held bound by those of Sweden, she left to her rival all the advantages of many bloody campaigns; and excited in the grand seignior a desire of vengeance, which he was not long in inflicting. Nor were her plans of political aggrandisement free from fluctuations and contradictions. During the American war, one would have imagined that the trident of Neptune was, by her exertions, about to become the sacred symbol of liberty. She presented to the courts of Versailles, Madrid, and London, a memorial, in which she demanded, that the commerce of all nations, even of the belligerent powers, should be free and respected. She proposed that a league should be formed for its support, and for this purpose deputed prince Gallitzin to the States General. But, in 1793, she avowed principles directly opposite. Influenced solely by her rage against France, she announced war against that republic, without discussion, without manifesto, without even being able to allege, with regard to a state so remote from her territories, that barbarous maxim, which has slipped from the pen of Montesquieu himself;—'that the law of natural defence sometimes involves the necessity of attack, when a people sees, that a longer peace would enable another power to effect their destruction.' Esprit de Loix, L. 10. c. 2. With all her foibles, however, Catherine had some right to the panegyrics of men of letters. She purchased the praises of several French philosophers, and she did not overlook the merits of various British authors. After the example of some of the tyrants of antiquity, she renewed the singularity of royal and philosophic banquets. Like Dionysius, Pisistratus, and Hiero, she collected Platos, Aristippi, and Pindars at her suppers. The imperial resentment, however, was sometimes excited; on which occasions the wit was rewarded with banishment; a premium which Diderot received for his frankness. The compliment she paid to the rhetorical merits of Mr. Fox, by requesting his bust, and placing it between those of Cicero and Demosthenes in her library, for his having prevented the threatened rupture between Great Britain and Russia, reflects honor on her memory, as well as on that of the orator. Her purchasing the libraries, letters, and papers of Messrs. Voltaire and D'Alembert also evidenced her literary taste; unless, as a French writer suspects, she did it with a view to bury the relics of these great men. This extraordinary woman died suddenly and unseen, in her water-closet, on the 17th of November, 1796, in the sixty-seventh year of her age.

Ca'therine Pear. See Pyrus.

For streaks of red were mingled there,
Such as are on a Catherine pear,
The side that 's next the sun. — *Suckling.*

CATHERINEBERG, a town of Sweden, in the province of West Gothland. It is the birth-place of the celebrated chemist, Sir Torbern Bergman.

CATHETER. *n. s.* καθετηρ, from καθιημι, I let down into. A hollow and somewhat crooked instrument, to thrust into the bladder, to assist in bringing away the urine, when the passage is stopped by a stone or gravel.

A large clyster, suddenly injected, hath frequently forced the urine out of the bladder; but if it fail, a *catheter* must help you. — *Wiseman's Surgery.*

CATHETOLIPES, in natural history, the name of a genus of fossils of the class of the selenitæ, but differing from the common kinds, in the constituent plates being ranged perpendicularly, and not horizontally on each other.

CATHETUS, in architecture, a perpendicular line, supposed to pass through the middle of a cylindrical body, as a baluster, column, &c.

Cathetus, in geometry, a line or radius falling perpendicularly on another line or surface; thus the catheti of a right-angled triangle, are the two sides that include the right angle.

CATHO'LICISE, or
Ca'tholise, *s.*
Ca'tholick, *n.* & *adj.*
Ca'tholickly,
Ca'tholickness, *n.*
Catho'lical, *adj.*
Catho'licism, *n.*

Fr. *catholique*, Ital. *cattolico*; Sp. *catolico*; Gr. καθολικος, from ολος, universal, the whole, all; thence applied to the whole Christian church.—The verb is not in use. Cotgrave and Sherwood define it 'to catholikize it, play the catholicke, become a catholicke.' Catholicism is adherence to the Catholic church; orthodox faith; catholickly is generally; catholickness; universality.

The church of Jesus Christ is called catholic, because it extends throughout the whole world, and is not limited by time. Some truths are said to be catholic because they are received by all the faithful. Catholic is often set in opposition to heretic or sectary, and to schismatic. Catholic or canonical epistles, are seven in number; that of St. James, two of St. Peter, three of St. John, and that of St. Jude. They are called catholic, because they are directed to all the faithful, and not to any particular church; and canonical, because they contain excellent rules of faith and morality.

> Doubtless the success of those your great and *catholick* endeavours will promote the empire of man over nature, and bring plentiful accession of glory to your nation. *Glanville's Scepsis.*

> All pope's believers think something divine,
> When images speak, possesseth the shrine;
> But they who faith *catholick* ne'er understood,
> When shrines give an answer, a knave's on the rood.
> *Marvell.*

> Those systems undertake to give an account of the formation of the universe, by mechanical hypotheses of matter, moved either uncertainly, or according to some *catholick* laws. *Ray.*

Catholic Church. The rise of heresies induced the primitive Christian church to assume to itself the appellation of catholic, being a characteristic to distinguish itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians. The Romish church now distinguishes itself by the name of catholic, in opposition to all who have separated from her communion, and whom she considers as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no catholic church in being, that is, no universal Christian communion. We shall treat of the existing state of the Roman Catholic church under that more appropriate title.

Catholic King is a title which has been long hereditary to the king of Spain. Mariana pretends, that Recarede first received this title after he had destroyed Arianism in his kingdom, and that it is found in the council of Toledo for the year 589. Vasce ascribes the origin of it to Alphonsus I. in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Colombiere says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend it had been borne by their predecessors the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others say, that Philip of Valois first bore the title; which was given him after his death by the ecclesiastics, on account of his favoring their interests. In some epistles of the ancient popes, the title catholic is given to the kings of France and of Jerusalem, as well as to several patriarchs and primates.

CATHO'LICON, *n. s.* from catholic; *καθολικον ιαμα*; a universal medicine.

> Preservation against that sin, is the contemplation of the last judgment. This is indeed a *catholicon* against all; but we find it particularly applied by St. Paul to judging and despising our brethren. *Government of the Tongue.*

> Here the great masters of the healing art,
> These mighty mock-defrauders of the tomb,
> Spite of their juleps and *catholicon*,
> Resign to fate! *Blair's Grave.*

CA'TILINISM, *n.* from Catiline; a conspiracy.

CATILINE (Lucius Sergius), a Roman of a patrician family, who, having spent his fortune in debauchery, formed the design of destroying the senate, seizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow citizens. He drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was discovered by the vigilance of Cicero, who was then consul. Upon which, retiring from Rome, he put himself at the head of an army, with several of the conspirators, and fought with incredible valor against Petreius, lieutenant to Anthony, who was colleague with Cicero in the consulship; but was defeated and killed in battle. See Rome. Sallust has given an excellent history of this conspiracy.

CATO (Marcus Porcius), Major, the censor, one of the greatest men among the ancients, was born at Tusculum, A.U.C. 519, and A.A.C. 232. He began to bear arms at seventeen; and, on all occasions, showed extraordinary courage and great sobriety; considering no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he always groomed it. At his return from his first campaign, he plowed his own ground, though he had slaves to do it. He dressed also like his slaves, sat at the same table with them, and partook of the same fare. He employed his rhetorical talents in pleading causes in the neigbouring cities without fee or reward. Valerius Flaccus, who had a country seat near Cato, conceiving an esteem for him, persuaded him to come to Rome; and here, by his own merit, and the influence of so powerful a patron, he was soon noticed. He was first elected tribune of the soldiers for Sicily. Next he was made questor in Africa under Scipio, whom he reproved for his profuseness to his soldiers. Being afterwards prætor, he fulfilled the duties of that office with the strictest justice. He conquered Sardinia, governed it with admirable moderation, and was elected consul. Being tribune in the Syrian war, he gave distinguished proofs of his valor against Antiochus the Great; and at his return stood candidate for the censorship. But the nobles, who not only envied him as a new man, but dreaded his severity, set up against him several powerful competitors. Valerius Flaccus, who had been his colleague in the consulship, was a ninth candidate, and these two united their interests. On this occasion Cato, far from flattering the people, or giving hopes of gentleness in the execution of his office, declared from the rostra, with a threatening look and voice, 'That the times required firm and vigorous magistrates to put a stop to that luxury which menaced the republic with ruin; censors who would cut up the evil by the roots, and restore the rigor of ancient discipline.'

gainst all; but we find it particularly applied by S.
aul to judging and despising our brethren.

declared from the rostra, with a threaten-
and voice, 'That the times required
vigorous magistrates to put a stop to
y which menaced the republic with
ors who would cut up the evil by the
estore the rigor of ancient discipline.'

To the honor of the Romans, notwithstanding these intimations, they preferred him to all his competitors. The comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformations he had in view. With all these accomplishments, Cato had very great faults. His ambition, poisoned with envy, disturbed both his own peace and that of the whole city, as long as he lived. Though he would not take bribes, he amassed wealth by all such means as the law did not punish. His first act in his new office was naming his colleague to be prince of the senate. But what most offended the nobles and their ladies was the taxes he imposed on luxury in all its branches; dress, household furniture, women's toilets, chariots, slaves, and equipage. The people, however, were so pleased with his regulations, that they ordered a statue to be erected to his honor in the temple of Health, with an inscription importing, that by his wise ordinances he had reformed the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expressing their surprise, that while many persons without merit or reputation had statues, he had none; he answered, 'I had much rather it should be asked why the people have not erected a statue to Cato, than why they have.' Being, in the third Punic war, despatched to Africa, he warmly exhorted the senate to destroy a city and republic, during the existence of which, Rome could never be safe: and after this time never spoke in the senate upon any subject, without concluding with these words, 'I am also of opinion that Carthage ought to be destroyed.' Cato, however severe as a public magistrate, was, in private life, sociable and good-humored, and intermixed his conversation with the liveliest and happiest wit. Plutarch has collected a pretty large number of his sayings. He had married a very handsome wife, who, being extremely afraid of thunder, always threw herself into her husband's arms at the least noise she heard in the sky. Cato, who was very willing to be caressed, told his friends that 'his wife had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry.' Cato died A. U. C. 604, aged eighty-five. He wrote, 1. A Roman History; 2. Concerning the Art of War; 3. Of Rhetoric; 4. A Treatise of Husbandry. Of these, the last only is extant.

Cato (Marcus Portius), Minor, was great grandson of Cato the Censor, and from his infancy discovered a singular inflexibility of mind. Sylla, having had a friendship for the father of Cato, sent often for him and his brother. Cato, who was then about fourteen years of age, seeing the number of heads sometimes brought in, asked his preceptor, 'Why does nobody kill this man?' 'Because,' said the other, 'he is more feared than he is hated.' The boy replied, 'Why then did you not give me a sword when you brought me hither, that I might have stabbed him, and freed my country from this slavery?' He imbibed the principles of the Stoic philosophy, under Antipater of Tyre. To increase his bodily strength, he inured himself to extremes of heat and cold; and used to make journeys on foot, and bareheaded, in all seasons. When he was sick, patience and abstinence were his only remedies. Though remarkably sober in the beginning of his life, making it a rule to drink but once after supper, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends excused this, by saying that the affairs of the public engrossed his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Cæsar wrote that Cato was once found dead drunk at the corner of a street, early in the morning, and that the people blushed when they found it was Cato. He affected singularity; and magnanimity and constancy are generally ascribed to him. 'Cato,' says Seneca, 'having received a blow in the face, neither took revenge nor was angry; he did not even pardon the affront, but denied that he had received it. His virtue raised him so high, that injury could not reach him.' Our Stoic, however, was for going to law with Scipio; but his friends diverted him from that design, and he revenged himself by making verses upon his rival. He married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for very indiscreet conduct. He served as a volunteer under Gallius in the war of Spartacus; but refused the military rewards offered him by the commander. Some years after, he went a legionary tribune into Macedonia, in which station he appeared, in his dress, and during a march, more like a private soldier than an officer. On his return home he was chosen questor; and had scarce entered on his charge, when he made a great reformation with regard to the registrars, whose places were for life, and through whose hands all the public accounts passed. He greatly pleased the people, by making the assassins, to whom Sylla had given considerable rewards, for murdering the proscribed, disgorge their gains. At first his austerity and stiffness displeased his colleagues; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. To keep out a very bad man, he put in for the tribunate. He sided with Cicero against Catiline, and opposed Cæsar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking; yet none could find fault with his conduct. He tried to bring about an agreement between Cæsar and Pompey; but, seeing it in vain, sided with the latter. When Pompey was slain, he fled to Utica; and, being pursued by Cæsar, advised his friends to be gone, and throw themselves on Cæsar's clemency. His son, however, remained with him; and Statilius, a young man, remarkable for his hatred to Cæsar. The evening before his death, after bathing, he supped with his friends and the magistrates of the city. They sat late, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that 'the wise man alone is free, and that the vicious are slaves;' Demetrius, who was a Peripatetic, undertook to confute it. Cato, in answer, treated the matter with so much earnestness and vehemence of voice, that he confirmed the suspicions of his friends that he designed to kill himself. When he had done speaking, a melancholy silence ensued; and Cato perceiving it, turned the discourse to the present situation of affairs, expressing his concern for those who had been obliged to put to sea, as well as for those who had determined to make their escape by land, and had a dry and sandy desert to pass. The company being dismissed, he walked for some time with a few friends, and going into his chamber, embraced his son with more than usual tenderness, which farther confirmed the suspicions of his resolution. Then lying down on his bed, he took up Plato's Dialogue on the Immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed, he called a slave, and asked who had taken it away; and, receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword; and, without showing any impatience, ordered it to be brought to him; but, having read out the book, and finding nobody had brought it, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence that he very much hurt his own hand, crying out in a passionate manner, 'What! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy?' Immediately his son and friends rushed into the room; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking fiercely at them, 'How long is it,' said he, 'since I have lost my senses, and my son is become my keeper?' They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp, 'Now,' said he, 'I am my own master:' and, laying it down, he took up his book again, which he read twice over. After this he slept so soundly that he was heard to snore by those near him. About midnight he called two of his freed men, Cleanthes his physician, and Butas, whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the Romans were gone; to the physician he gave his hand to be dressed, which was swelled by the blow he had given his slave. This was thought an intimation that he intended to live, and gave great joy to his family. It was now break of day, and Cato slept yet a little more, till Butas returned to tell him that all was perfectly quiet. He then ordered him to shut his door, and flung himself upon his bed, as if he meant to finish his night's rest; but immediately he took his sword, and stabbed himself a little below his chest; yet not being able to use his hand so well by reason of the swelling, the wound did not kill him. It threw him into a convulsion, in which he fell upon his bed, and overturned a table near it. The noise gave the alarm; and his son and friends entering the room, found him weltering in his blood, and his bowels half out of his body. The surgeon, upon examination, found that his bowels were not cut; and was preparing to replace them, and bind up the wound, when Cato recovering, thrust the surgeon from him, and tearing out his bowels, immediately expired, in the forty-eighth year of his age. By this rash act, independent of all other considerations, he carried his patriotism to the highest degree of political frenzy: for Cato, dead, could be of no use to his country; but had he preserved his life, his counsel might have moderated Cæsar's ambition, and, as Montesquieu observes, have given a different turn to public affairs.

CATO'NIAN, *adj.* from Cato; Cato-like, grave, austere.

CATOPTRICKS. See Optics and Light.

CAT-SALT, a name given by salt workers to a very beautifully granulated kind of common salt. It is formed out of the bittern, or leach-brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under these troughs are placed vessels to receive this brine, and across them small sticks to which the cat-salt affixes itself in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, is very sharp and pungent, and is white when powdered, though pellucid in the mass. It is used by some for the table, but the greatest part of it is used by the makers of soap

CATSUP. See Ketchup.

CATTARO, a fortified town of Austria, situated at the bottom of a gulf of the same name, twenty-eight miles W. N. W. of Scutari, and capital of the district of Cattaro. It is defended by a castle and battlements, and the rocks around it are so steep and high, that in winter the sun is seen only for a few hours. This is a bishop's see; and a chapter of twelve prebendaries meet here. There are alse three monasteries and two nunneries. Cattaro was ceded by the Austrians, its original possessors, to the French, at the peace of Presburg, 1805. The Russians, however, took possession of it till the peace of Tilsit, when it was again given up to France, but was returned to Austria at the congress of Vienna

CATTI, an ancient people of Germany, who inhabited the country reaching on the east to the river Sala, and on the north to Westphalia; besides Hesse, Wetteravia, and part of the tract on the Rhine, and the banks of the Lahn.

Catti, or Cattivellauni, one of the bravest of the ancient nations of Britain, seated in the country which is now divided into the counties of Hertford, Bedford, and Bucks. The name of this people is written in different ways by Greek and Roman authors, being sometimes called Cassi, Catticuchlani, Catticlaudani, &c. They were of Belgic origin, and it is not improbable that they derived their name Catti from the Belgic word Katten, which signifies illustrious or noble, and that the addition of Vellauni, on the banks of rivers, might be given to them after their arrival in Britain, as descriptive of the situation of their country. Cassibelan, their prince, was made commander-in-chief of the confederated Britons, not only on account of his own personal qualities, but also because he was at the head of one of their bravest and most powerful tribes. In the interval between the departure of Cæsar and the next invasion under Claudius, the Cattivellauni had reduced several of the neighbouring states under their obedience; and again took the lead in opposition to the Romans at the second invasion, under their brave but unfortunate prince

Caractacus. The country of the Cattivellauni was much frequented and improved by the Romans after it was subdued. See Durocobriva.

CATTLE, *n.* The etymology of this word is uncertain. Skinner, Menage, and Spelman, derive it from capitalia, personal goods, whence the word chattels; and their conjecture seems not to be without foundation, as in the old French catal means moveables of any kind; and the term chattail is provincially used in France, in the vicinity of Lyons, to signify all the beasts on an estate. The word in the quotation from Chaucer, will admit of a double meaning; but it probably stands for chattles, as we still say in legal language, goods and chattles; but in that case it shows that there was no difference in the spelling of the two words. Cattle, besides its primary sense of beasts of pasture, is also used as a term of reproach.

For body, good, and *catell*, and lyff, he set at nought,
So was his hert ywoundit for anger and for thought.
Chaucer's Canterbury Tales.

Make poor men's *cattle* break their necks.
Shakspeare.

Boys and women are for the most part *cattle* of this colour. *Id.*

When Lubberkin to town his *cattle* drove,
A maiden fine bedight he hapt to love;
The maiden fine bedight his love retains,
And for the village he forsakes the plains. *Gay.*

The exercise of fraud or rapine is unpunished in a lawless community; and the market is continually replenished by the abuse of civil and paternal authority. Such a trade, which reduces the human species to the level of *cattle*, may tend to encourage marriage and population. *Gibbon.*

Cattle is a collective word, implying those quadrupeds which serve either for tilling the ground, or for food to men. They are distinguished into large, or black cattle, and small cattle: the former including horses, seldom known under that name, bulls, oxen, cows, calves, and heifers; the latter, rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm, and those who raise them are called graziers.

CATULLUS (C.), or Q. Valerius, a poet of Verona, who wrote in the times of Cæsar and Pompey, and whose compositions, though elegant, abound with the licentiousness common to that period. He was intimate with the most distinguished men of his age, and directed his satire against Cæsar, whose only revenge was to invite the poet to his table. Catullus was the first Roman who imitated with success the Greek writers, and introduced their numbers among the Latins: and he died in the forty-sixth year of his age, B. C. 40. The best editions of his works, which consist only of epigrams, are that of Vulpius, 4to. Patavii, 1737, and that of Barbou, 12mo. Paris, 1754.

CATURUS, in botany, a genus of plants of the class diœcia, and order triandria. Male: cal. none: cor. three-cleft. Female: cal. tripartite: cor. none: styles three: caps. three-grained and three-celled: seed. solitary: species, two, one a native of India, the other of Cochin China.

CATY, Cati, or Catti, an East Indian weight used especially at China, equivalent to twenty-five ounces and two drams English. It is also used in Japan, Batavia, and other parts of the Indies, but differs in weight.

CATZENELBOGEN, a town and castle of Germany, in the late circle of the Upper Rhine, which gives name to a county. The river of Maine and the city of Mentz, with its territories, divide the county into Upper and Lower, the former belongs to Hesse Darmstadt, and is called Darmstadt from its capital; and the latter to Hesse Reinfields, of which St. Goar is the capital. The town of Catzenelbogen lies twenty-eight miles N. N. W. of Mentz, and has an iron mine near it.

Cava, in anatomy, the largest vein in the body, terminating in the right ventricle of the heart. It is divided in cava ascendens and cava descendens. See Anatomy.

CAVALCA'DE, *n.* Old Fr. *cavalcade;* Ital. *cavalcata;* low Lat. *caballicare;* from *caballus*, καβαλλος. A procession on horseback.

First he that led the *cavalcate*
Wore a sow-gelder's flagellate,
On which he blew as strong a levete
As well-feed lawyer on his brev'ate,
When over one another's heads
They charge, three ranks at once, like Sweads.
Hudibras.

Your *cavalcade* the fair spectators view,
From their high standings, yet look up to you;
From your brave train each singles out a ray,
And longs to date a conquest from your day.
Dryden.

How must the heart of the old man rejoice, when he saw such a numerous *cavalcade* of his own raising.
Addison.

CAVALCADEUR, or Cavelcadour, anciently denoted a riding-master, but is now only applied to a sort of equerries who have the direction of princes' stables.

CAVALI'ER, *n* & *adj.*
Cavalie'rish, *adj.*
Cavali'erly, *adv.*
Cavali'erness, *n.*
Cavali'ero, *n.*

Fr. *chevalier, cavalier;* It. *cavaliere;* Sp. *caballero;* from Fr. *cheval;* Lat. *caballus.* The noun, in its primary sense, indicates one who rides on horseback; and, as that was anciently done only by persons of birth, the word was also applied to any gay, sprightly, military man or gentleman. Cavalier, as an adjective, not only means sprightly, warlike, generous, brave, but also haughty, disdainful. In this last sense it became the designation of the party of Charles I.; some of his military officers having given words of 'great contempt,' and even blows, to the 'vile rabble,' as Clarendon calls them. Cavalierly is haughtily; disdainfully. Cavalierness is arrogant or contemptuous conduct.

For who is he, whose chin is but enriched
With one appearing hair, that will not follow
These culled and choice drawn *cavaliers* to France.
Shakspeare.

The people are naturally not valiant, and not much *cavalier*. Now it is the nature of cowards to hurt, where they can receive none. *Suckling.*

Presbyter Hollis the first point should clear,
The second Coventry, the *cavalier*,
But would they not be argued back from sea,
Then to return home strait infecta re. *Marvell.*

Each party grows proud of that appellation which their adversaries at first intended as a reproach: of this sort were the Guelfs and Gibelines, Huguenots, and *cavaliers*. *Swift.*

In short, he was a very perfect *cavaliero*,
And to his very välet seemed a hero.
Byron's Beppo.

Cavalier, in history, an appellation, given in the revolution of 1649 to the royalists and partisans of Charles I. in opposition to the roundheads or puritans, the favorites of the parliament and Cromwell. See England, History of.

Cavalier, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a bastion, bordered with a parapet, and cut into more or fewer embrasures, according to its capacity. Cavaliers are a double defence for the faces of the opposite bastion: they defend the ditch, break the besiegers' galleries, command the traverses in dry moats, scour the saliant angle of the counterscarp, where the besiegers have their counter batteries, and enfilade the enemies trenches, or oblige them to multiply their parallels. They are likewise very serviceable in defending the breach and the retrenchments of the besieged, and can greatly incommode the entrenchments which the enemy make, being lodged in the bastion.

CAVELIERI (Bonaventure), an eminent mathematician of the seventeenth century, a native of Milan, and professor of mathematics at Bologna, where he published several works on that science, particularly the Method of Indivisibles. He was a scholar of Galileo. His Directorium Generale Uranometricum contains a great variety of most useful rules in trigonometry and astronomy.

CAVALLO (Tiberius), was born at Naples, in 1749, and was the son of an eminent physician of that place. His original destination was to a mercantile profession at London, and he came to England with that view in the year 1771. But the study of nature displaying superior attractions, he was seduced from the counting-house, to the leisure of philosophical retreat, and acquired a well merited reputation as a digester and elucidator of philosophical discoveries. In the year 1779 he was admitted a member of the Neapolitan Academy of Sciences, as well as of the Royal Society of London. For the progress and diffusion of science, we are indebted not more to the happy efforts of original genius, than to the judicious industry of those authors who, from time to time, employ their talents in digesting and elucidating successive discoveries. The distinguished rank which Mr. Cavallo held in this useful class of philosophical laborers, is sufficiently known. His treatises on popular and interesting branches of physics, may be justly esteemed some of the best elementary works which are extant in our language. They possess every requisite of such performances, perspicuity of style, proper selection of materials, and clear arrangement. The merit of Mr. Cavallo is not, however, the merit of a merely judicious compiler. He never aspires indeed to form new and comprehensive views; yet, he generally improves, in some degree, the stock of valuable facts, by his own occasional experiments. He was the author of several papers, published at different times in the Philosophical Transactions of the Royal Society of London. His publications were as follows: A Complete Treatise of Electricity in Theory and Practice, with Original Experiments, one vol. 8vo. 1777, enlarged to three volumes in 1795. An Essay on the Theory and Practice of Medical Electricity, one vol. 8vo. 1780. A Treatise on the Nature and Properties of Air, and other Permanently Elastic Fluids, with an Introduction to Chemistry, 4to. 1781. The History and Practice of Aërostation, 8vo. 1785. Mineralogical Tables, fol. accompanied with an explanatory pamphlet, 1785. A Treatise on Magnetism, in Theory and Practice, with original experiments, 8vo. 1787. Description and Use of the Telescopical Mother-of-Pearl Micrometer, invented by T. C. 8vo. 1793. An Essay on the Medicinal Properties of Factitious Airs, with an Appendix on the Nature of Blood, 8vo. 1798. He died in London in the beginning of 1810.

CA'VALRY. Fr. *cavalerie*. This word was formerly written and pronounced in four syllables, and meant horsemanship, as well as horsemen; but the former sense has grown obsolete. Cavalry signifies horse troops; bodies of men furnished with horses for war.

If a state run most to gentlemen, and the husbandmen and plowmen be but as their workfolks, you may have a good *cavalry*, but never good stable bands of foot. *Bacon's Henry VII.*

Their *cavalry*, in the battle of Blenheim, could not sustain the shock of the British horse.
Addison on the War.

Cavalry, a body of men that fight only on horseback. The word is derived from cavalerie (French), and that from the Latin, caballus, a horse. The Roman cavalry consisted wholly of equites, or knights. The Grecian cavalry were divided into cataphractæ and non-cataphractæ, i.e. into heavy and light armed. Of the Greeks, the Thessalians excelled most in cavalry. The Lacedæmonians, inhabiting a mountainous country, were but meanly furnished with cavalry, till, carrying their arms into other countries, they found great occasion for horse to support and cover their foot. The Athenian cavalry, for a considerable time, consisted only of ninety-six horsemen; but, after expelling the Persians out of Greece, they increased the number to 300, and afterwards to 1200, which was the highest number of cavalry the Athenians ever kept. The Turkish cavalry consists partly of spahis and partly of horsemen, raised and maintained by the zaims and timariots. The chief use of the cavalry is to make frequent excursions to disturb the enemy, intercept his convoys, and destroy the country: in battle to support and cover the foot, and to break through and disorder the enemy; also to secure the retreat of the foot. Formerly the manner of the fighting of the cavalry was, after firing their pistols or carabines to wheel off, to give opportunity for loading again. Gustavus Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridlehand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

Modern cavalry consists of, first, Heavy Horse; in England the Horse Guards and the Oxford Blues are the only troops of heavy horse; second, Dragoons, distinguished from the former by being obliged to fight on foot as well as on horseback; thirdly, Light Horse regiments, mounted on light swift horses, whose men are of middling stature, and but lightly accoutred; fourth, Hussars, originally Hungarian Horse, who wear a very short waistcoat, and a curious doublet, which generally hangs loose on the left shoulder, having several rows of buttons. Their arms are a long crooked sabre, and pistols and carbine; fifth, Lancers, whose principal instrument is a lance with a streamer to its head to frighten the horses of the enemy. See LANCERS.

CAVAN, a county of Ireland, in the province of Ulster, forty-seven miles long, and twenty-four broad; bounded on the west by Leitrim; on the north by Fermanagh; on the east by Monaghan, Louth, and East Meath; and on the south by West Meath and Longford. It contains upward of 8000 houses, thirty-seven parishes, seven baronies, and two boroughs; viz. Cavan and Kilmore. It is populous, and carries on the linen manufacture to a great extent. It sends two members to parliament. It is bleak and open in many parts, but, between Cavan and Lough Erne, the country is picturesque and well wooded, and at the foot of the hills are many beautiful little lakes.

CAVAN, the capital of the above county, is fifty-four miles north-west of Dublin.

CA'VATE, *v.* Lat. *cavo*. To hollow out; to dig into a hollow.

CAVA'ZION, *n.* Lat. *cavo*. In architecture The hollowing or under-digging of the earth for cellarage; allowed to be the sixth part of the height of the whole building.

CAUBUL, CABUL or KABOUL, a considerable province of Afghaunistaun, between the thirtieth and thirty-fifth degrees of north latitude. It is about 250 miles long, and 150 miles broad; being bounded on the north by Kuttore, or Caffristan; on the south by Candahar and Baloochistan; on the east by the Indus; and on the west by Hindoo Kho Mountains, and the province of Bamian. The surface is diversified by vast snowy mountains, hills, extensive plains, and woods. Noble rivers traverse the province, of which Cabul, called also in some parts of its course Attacka, and Cow or Cowmull, are the principal. The leading ridge of high mountains, usually covered with snow, runs from west to east from the neighbourhood of Ghizni to that of Deerukote on the Indus, below Attock, and divides the country into two parts. The tract lying to the north of this is named Lumghanat, and to the south Bungishat; each having one or more considerable streams that finally fall into the Indus. From the neighbourhood of this river to the city of Caubul there is so great deficiency of wood, that all classes of the people suffer at times from want of fuel. Near Baramow is a sandy, uninhabited valley, twenty miles in length; and around Gundamouck the exposed part of the body is frequently covered with a nitrous, scaly, and white substance, which excoriates the skin, and tastes very salt. The chief towns are Cabul and Peshawer.

The soil and productions are very various. The plains of Peshawer and Candahar are fertile, and produce two crops annually of wheat and barley, which are here preferred to Indian corn and rice. The mountain chains are, many of them, condemned to perpetual sterility, and on the south, the moving sand being blown over the fertile tracts, often covers them and converts them into deserts. From Peshawer the central districts receive sugar and cotton cloths in exchange for leather, iron, and tobacco; and the same commodities, with lamp-oil, are exported to Candahar, for which the returns are made in European and Persian manufactures. Horses, furs, and hides, are brought to Caubul from Bocharia.

The regal government of Caubul has been compared to that which was exercised by the ancient Scottish monarchs. Over the great towns and their vicinity, and in regard to foreign dependencies, his authority is supreme and direct. The rest of the country is divided into clans, called Oolooss, who act nearly independently of the sovereign, furnishing contingents of troops or money in war. These are governed by a khaun; who is appointed by the king, out of the oldest family of the oolooss, and who always acts in concert with the jeerga, or representative assembly of the people. Much of the ordinary judicial power is also in this body. The Afghauns of this district are rude in their manners,and the country affords abundant shelt to banditti; but the improvements that follow every portion of political liberty are seen very distinctly here, according to Mr. Elphistone, and their hospitality is unbounded. See AFGHAUNISTAUN.

The British government, in 1809, sent an embassy to the sovereign of this country, and an alliance was entered into, in which it was agreed that the armies of Caubul should oppose the progress of the French and Persians, in case they should attempt a passage to the British territories. Mr. Elphinstone's account of this mission is the only description of the territory worth referring to.

CAUBUL, the capital of the foregoing province, stands in a spacious plain, which is well watered by the river of that name, and interspersed with other small walled towns. The capital is surrounded by a wall, about a mile and a half in circumference, and the houses are built of stone, clay, and bricks unburnt. The vicinity is adorned by excellent fruit gardens, and the great bazaar, or market-place, is much crowded. The city is frequented by the Usbec Tartars, and Hindoo merchants, who are protected by the government. It is 839 miles distant from Delhi, and 1815 from Calcutta.

CAUCA, an ancient town in Old Castile, Spain, taken by the Romans under Lucullus, A. U. C. 601. when a dreadful massacre of the inhabitants took place. It is eighteen miles north of Segovia.

Cauca, a large river of South America, which has its rise in the province of Popayan, between the great western and middle ridges of the Andes. After a course of about 500 miles, it falls into the Rio Magdalena, in lat. 4° 30′ S. Also a river in the province of Venezuela.

CAUCALIS, in botany, bastard parsley, a genus of the digynia order and pentandria class of plants; natural order forty-fifth, umbellatæ: Involucres undivided: flowers radiate: florets of the centre male; fruit subovate, striate, muricate with stiff bristles. Species thirteen; many of them natives of the hedges or corn fields of our own country, the rest chiefly of the south of Europe.

CAUCASUS, a general name for a high ridge of mountains in Asia. Sir John Chardin describes one mountain under this name as the highest of the ridge, and the most difficult to pass. It has frightful precipices, and in many places the roads are cut out of the solid rock. This mountain is thirty-six leagues over, and the summit eight leagues broad. The top is perpetually covered with snow. Other parts, however, are extremely fruitful.

The ridge extends between the Caspian and the Black Seas, and makes a curve near Astrakhan, directing its course towards the eastern shore of the Caspian, where they become secondary mountains, being disposed in strata. As they are an inexhaustible magazine of combustible substances, they contain an astonishing quantity of metals. Along the foot of the chain we sometimes meet with warm springs of naphtha of different qualities, &c. see Caspian; sometimes we find native sulphur, mines of vitriol, or lakes heated by internal fires. These mountains, excepting the tops, which are always covered with snow, are very fertile; abounding in corn, wine, honey, gum, fruits, hogs, and large cattle. The vines twine about the trees, and rise so high, that the inhabitants cannot gather the fruit from the uppermost branches. They are inhabited by various nations; as the Abkhas, Circassians, Georgians, Tartars, &c. who all speak different languages. See these articles. They have many streams of excellent water, and a vast number of towns and villages. The inhabitants are for the most part Christians of the Georgian church. They have fine complexions, and the women are very beautiful. In winter they wear snow shoes in the form of rackets, which prevent them from sinking in the snow, and enable them to run upon it with great swiftness.

CA'UDAL, *adj.*
Ca'udate, *adj.*
Ca'udated, *adj.*
} Lat. *cauda*. That which relates to the tail of an animal; having a tail.

How comete, *caudate*, crinite stars are framed
I know. *Fairfax. Tasso.*

The tail, instead of scuta is furnished with sub*caudal*, squama. *Russel.*

CA'UDEBECK, *n.* A sort of light hat, so called from a town in France where they were first made.

CAUDEX, by Malpighi and others, is used for the stem or trunk of a tree: by Linnæus for the body of the root, part of which ascends, part descends See Botany.

CAUDINÆ Furcæ, or Caudinæ Furculæ, spears disposed in the form of a gallows, under which prisoners of war were made to pass. They gave name to a narrow pass near Caudium, where the Samnites obliged the Roman army and the two consuls to lay down their arms and pass under the gallows, or yoke, as a token of subjection.

CA'UDLE, *v.* & *n.* Fr. *chaudeau*, says Dr. Johnson; but the old Fr. *caudelée*, comes still nearer. Those who are fond of etymological travelling, may proceed to the Lat. *calidus*, and Gr. καυδαυλος, as Junius and Skinner have done before them. The thing itself is a mixture of gruel, wine, or beer, sugar, and spices; which is given to women in childbed, to those who visit them, and to sick people. To caudle is to make caudle; to mix as caudle.

He had good broths, *caudle*, and such like; and I believe he did drink some wine. *Wiseman.*

Ye shall have a hempen *caudle* then, and the help of a hatchet. *Shakspeare.*

Will the cold brook,
Candied with ice, *caudle* thy morning toast,
To cure thy o'ernight's surfeit. *Id.*

CA'VE, *v.* & *n.*
Ca'vern, *n.*
Ca'vernous, *adj.*
Ca'vity, *n.*
} Fr. *cave*, *caver*, *cavité*; Ital. *cavar*, *cavare*, *caverna*; Lat. *cavea*, *caveus*, hollow. from χάος. Eol. dial. χαFος

In the Goth. *kaf* means *profundum*, and may thence have been borrowed to signify any thing deep or hollow. A cave, or cavern, is a den; a habitation in the earth; it formerly meant also any hollow place. To cave, is to dwell in a cave. Cavernous, and caverned, indicate anything full of caverns, hollow, excavated; and the latter word has likewise the sense of dwelling in a cavern. Cavity is hollowness; hollow; a hollow place.

Two little windows ever open lie,
The sound unto the *cave's* third part conveying;
And slender pipe, whose narrow *cavity*.
Doth purge the inborn air, that idly staying,
Would else corrupt, and still supplies the spending;
The *cave's* third part in twenty by-ways bending,
Is called the labyrinth, in hundred crooks ascending.
Fletcher's Purple Island.

Such as we,
Cave here, haunt here as outlaws. *Shakspeare.*

The wrathful skies
Gallow the very wanderers of the dark
And make them keep their *caves*. *Id.*

Bid him bring his power
Before sun-rising, lest his son George fall
Into the blind *cave* of eternal night. *Id.*

Where wilt thou find a *cavern* dark enough
To mask thy monstrous visage? *Id.*

The object of sight doth strike upon the pupil of the eye directly; whereas the *cave* of the ear doth hold off the sound a little. *Bacon's Nat. Hist.*

Clorinda pastures, *caves*, and springs,
These once had been enticing things. *Marvell.*

Through this a *cave* was dug with vast expence;
The work it seemed of some suspicious prince.
Dryden.

There is nothing to be left void in a firm building; even the *cavities* ought not to be filled with rubbish, which is of a perishing kind. *Id.*

High at his head from out the *caverned* rock,
In living rills, a gushing fountain broke.
Pope's Odyssey.

AUDINÆ FURCÆ, or CAUDINÆ FURCULÆ,
rs disposed in the form of a gallows, under
:h prisoners of war were made to pass.
/ gave name to a narrow pass near Caudium,
re the Samnites obliged the Roman army and
wo consuls to lay down their arms and pass
er the gallows, or yoke, as a token of subjec-

To cure thy o'ernight's surfeit. *Id.*

A'VE, *v.* & *n.*
A'VERN, *n.*
A'VERNOUS, *adj.*
A'VITY, *n.*
Fr. *cave*, *caver*, *cavité*; Ital. *cavar*, *cavare*, *caverna*; Lat. *cavea*, *cavus*, hollow from χάος. Eol. dial. χαϝος and may
ıe Goth. *kaf* means *profundum*, and may
e have been borrowed to signify any thing
or hollow. A cave, or cavern, is a den;
ɔitation in the earth; it formerly meant also
hollow place. To cave, is to dwell in a cave.
rnous, and caverned, indicate anything full
averns, hollow, excavated; and the latter
has likewise the sense of dwelling in a ca-
Cavity is hollowness; hollow; a hollow
e.

Two little windows ever open lie,
e sound unto the *cave's* third part conveying;
And slender pipe, whose narrow *cavity*,
th purge the inborn air, that idly staying,
ɔuld else corrupt, and still supplies the spending;
e *cave's* third part in twenty by-ways bending,
called the labyrinth, in hundred crooks ascending.
Fletcher's Purple Island.

Such as we,
Cave here, haunt here as outlaws. *Shakspeare.*

The wrathful skies
Gallow the very wanderers of the dark
And make them keep their *caves*. *Id.*

Bid him bring his power
Before sun-rising, lest his son George fall
Into the blind *cave* of eternal night. *Id.*

Where wilt thou find a *cavern* dark enough
mask thy monstrous visage? *Id.*

e object of sight doth strike upon the pupil of the
irectly; whereas the *cave* of the ear doth hold
e sound a little. *Bacon's Nat. Hist.*

Clorinda pastures, *caves*, and springs,
These once had been enticing things. *Marvell.*

rough this a *cave* was dug with vast expence;
vork it seemed of some suspicious prince. *Dryden.*

ere is nothing to be left void in a firm building;
the *cavities* ought not to be filled with rubbish,
is of a perishing kind. *Id.*

High at his head from out the *caverned* rock,
living rills, a gushing fountain broke.
Pope's Odyssey.

No bandit fierce, no tyrant mad with pride,
No *caverned* hermit, rests self-satisfied. *Pope.*

No great damages are done by earthquakes, except only in those countries which are mountainous, and consequently stony and *cavernous* underneath.
Woodward's Natural History.

Embattled troops, with flowing banners, pass
Through flowery meads, delighted; nor distrust
The smiling surface; whilst the *caverned* ground
Bursts fatal, and involves the hopes of war
In fiery whirles. *Philips.*

If the atmosphere was reduced into water, it would not make an orb above thirty-two feet deep, which would soon be swallowed up by the *cavity* of the sea, and the depressed parts of the earth. *Bentley.*

For as he spoke the rending glebe gave way,
And fires infernal from beneath broke forth,
Disclosing horrid *caves* unknown to day,
Deep in the bowels of the groaning earth. *Gay.*

Goltho he calls; his manly voice he rears
Oft to its pitch, which hill and dale rebound;
The much-loved name each grot and *cavern* hears,
And Goltho echoes through the sylvan bound. *Id.*

Monsters of the foaming deep,
From the deep ooze and gelid *cavern* roused,
They flounce and tremble in unweildy joy.
Thomson.

Who from the black and bloody *cavern* led
The savage stern, and soothed his boisterous breath,
Who spoke, and Science reared her radiant head
And brightened o'er the long benighted waste.
Beattie.

Yet lingering comfortless in lonesome wild,
Where Echo sleeps mid *caverned* vales profound,
The pride of Troy, Dominion's darling child,
Pines while the slow hour stalks its sullen round.
Beattie

Is there no forest,
Whose shades are dark enough to shelter us,
Or *cavern*, rifled by the perilous lightning,
Where we must grapple with the tenantry wolf
To earn our bloody lair? there let us bide,
Nor hear the voice of man, nor call of heaven.
Maturin.

CAVE (Dr. William), a learned English divine, born in 1637, educated in St. John's Colledge, Cambridge, and successively minister of Hasely in Oxfordshire, All-hallows in London, and Islington. He became chaplain to Charles II. and in 1684 was installed a canon of Windsor. He compiled the Lives of the Primitive Fathers in the Three First Centuries of the Church, esteemed a very useful work; and Historia Literaria, &c. in which he gives an exact account of all who had written for or against Christianity, from the time of Christ to the fourteenth century: which works produced a warm controversy between Dr. Cave and M. Le Clerc, who was then writing his Bibliotheque Universelle in Holland. Dr. Cave died in 1713.

CAVE (Edward), celebrated as the projector of the Gentleman's Magazine, the first publication of the kind in England, was born in 1691. After passing some time at the free school of Rugby, he became clerk to a collector of excise; but soon left that situation and came up to London in quest of more suitable employment. Here he bound himself apprentice to Mr. Collins, a printer of some reputation. Within two years he attained to such skill in his art, and gained so far the confidence of his master, that he was sent to conduct a printing-house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured Cave the reputation of a writer. He afterwards obtained by his wife's interest a place in the post-office; but still continued, at his intervals of attendance, to exercise his business. He corrected the Gradus ad Parnassum: for which he was liberally rewarded by the company of stationers. He was afterwards raised to the office of clerk of the franks, in which he acted with great spirit and firmness; and his opposition to the abuse of this privilege occasioned his ejectment from the office. He had now, however, collected a sum sufficient for the purchase of a small printing-office, and began the Gentleman's Magazine; to the success of which he owed the affluence in which he passed the last twenty years of his life, and the fame deservedly attached to the name of its projector. Mr. Cave continued to improve his Magazine, and had the satisfaction of seeing its success proportionate to his diligence, till, in 1753, he fell into a diarrhœa, and afterwards into a kind of lethargic insensibility; and died Jan. 10th, 1754, having just concluded the twenty-third volume of his Magazine.

CA'VEAT, *n. s.* Lat. *caveat*, let him beware. Intimation of caution.

A *caveat* is an intimation given to some ordinary or ecclesiastical judge by the act of man, notifying to him, that he ought to beware how he acts in such or such an affair. *Ayliffe.*

The chiefest *caveat* in reformation must be to keep out the Scots. *Spenser on Ireland.*

I am in danger of commencing poet, perhaps laureat; pray desire Mr. Rowe to enter a *caveat*.
Trumbull to Pope.

CAVEAT, in law, an intimation to an ecclesiastical judge, to beware how he acts in such an affair, is used to stop the proving of a will, the granting letters of administration, &c. to the prejudice of another.

CAVEATING, in fencing, is the shifting the sword from one side of that of the adversary to the other.

CAVENDISH (Sir William), descended of an ancient family, was born about 1503. Having had a liberal education, he was taken into the family of cardinal Wolsey, whom he served as gentleman usher of the chamber. In 1527 he attended his master on his splendid embassy to France, returned with him to England, and was one of the few who continued faithful to him in his disgrace. He was with him when he died, and delayed going to court till he had performed the last duty of a faithful servant, by seeing his body decently interred. The king was so far from disapproving of his fidelity, that he immediately took him into his household, made him treasurer of his chamber, a privy-counsellor, and a knight. In 1540 he was nominated one of the auditors of the court of augmentations, and soon after obtained a grant of several lordships in Hertfordshire. In the reign of Edward VI. his estates were much increased by royal grants in seven different counties: and he continued in favor during the reign of Mary I. He died in 1557. He was the founder of Chatsworth, and

, ~cestor of the dukes of Devonshire. He wrote The Life and Death of Cardinal Wolsey: London 1667; reprinted in 1706.

Cavendish (William), duke of Newcastle, grandson of Sir William, was born in 1592. In 1610 he was made knight of the bath; in 1620 created baron Ogle, and viscount Mansfield; and in 1628 earl of Newcastle, and baron Cavendish. He was after this made governor to the prince of Wales, afterwards Charles II. When the troubles broke out in Scotland, and the king's treasury was low, he contributed £10,000, and raised a troop of horse, consisting of about 200 knights and gentlemen, who served at their own charge, were commanded by the earl, and entitled the prince's troop. He afterwards raised a body of 8000 horse, foot, and dragoons; with which he took some towns, and gained several unimportant victories. On this he was created marquis of Newcastle; but the king's affairs being ruined by the rashness of prince Rupert, he went abroad, and staid for some time at Paris; where his circumstances were so bad, that he and his wife were obliged to pawn their clothes for a dinner. He afterwards removed to Antwerp, where, notwithstanding his distress, he was treated, during an exile of eighteen years, with extraordinary marks of distinction. On his return at the Restoration, he was created earl of Ogle and duke of Newcastle. He spent his time in a country retirement, was the patron of men of merit, and died in 1697, aged eighty-four. He wrote a treatise on Horsemanship, which is esteemed; also four comedies.

Cavendish (William). This nobleman, who was the first duke of Devonshire, was born in 1640; and, in his twenty-first year, was elected one of the representatives of the county of Derby. In 1665 he served as a volunteer in the fleet, under the duke of York. As a member of parliament he distinguished himself against the arbitrary measures of the court; he appeared as a witness in favor of Lord Russell; and he offered to exchange clothes with that nobleman, to enable him to escape. His country is lastingly indebted to him, for his having been a very active planner of the revolution of 1688.

Cavendish (Hon. Henry), was born in London, on the 10th of October, 1731. His father was lord Charles Cavendish, of the Devonshire family. During his father's lifetime he was kept rather in narrow circumstances, being only allowed an annuity of £500 a year. It was during this period that he acquired those habits of economy, and those oddities of character, which he ever afterwards exhibited. At his father's death he was left a very considerable fortune; and an aunt, who died at a later period, bequeathed him a very handsome addition. It appeared to be finally not in his power to spend the greater part of his income: so that at the period of his death he left behind him nearly £1,300,000, and was the greatest proprietor in the Bank of England. His private bankers, at one period thinking it improper to keep so large a balance as he had left in their hands, sent one of the partners to wait upon him, in order to learn how he wished to dispose of it. The banker was admitted, and, after employing the necessary precautions with a man of Mr. Cavendish's peculiar disposition, stated the circumstance, and begged to know whether it would not be proper to lay out the money. Mr. Cavendish dryly answered, 'You may lay it out if you please,' and left the room. Mr. Cavendish hardly ever went into any other society than that of his scientific friends. He never was absent from the weekly dinner of the Royal Society Club, at the Crown and Anchor Tavern. At these dinners, when he happened to be seated near those he liked, he often conversed a great deal; though at other times he was very silent. He was, likewise, a constant attendant at Sir Joseph Banks's Sunday evening meetings. He had a house in London, which he only visited once or twice a week at stated times, and without ever speaking to the servants. It contained an excellent library, to which he gave all literary men the freest and most unrestrained access. But he lived in a house on Clapham Common, where he scarcely ever received any visitors. His relation, lord George Cavendish, to whom he left by will the greatest part of his fortune, visited him only once a year; and the visit hardly ever exceeded ten or twelve minutes. He was shy and bashful, to a degree bordering upon disease. He could not bear any person to be introduced to him, or to be pointed out, in any way, as a remarkable man. One Sunday evening, he was standing at Sir Joseph Banks's, in a crowded room, conversing with Mr Hatchett, when Dr. Ingenhousz, who had a good deal of pomposity of manner, came up, with an Austrian gentleman in his hand, and introduced him formally to Mr. Cavendish. He mentioned the titles and qualifications of his friend at great length, and said that he had been peculiarly anxious to be introduced to a philosopher so profound, and so universally known and celebrated, as Mr. Cavendish. As soon as Dr. Ingenhousz had finished, the Austrian gentleman began, and assured Mr. Cavendish that his principal reason for coming to London was to see and converse with one of the greatest ornaments of the age, and one of the most illustrious philosophers that ever existed. To all these high-flown speeches Mr. Cavendish answered not a word; but stood with his eyes cast down, quite abashed and confounded. At last, spying an opening in the crowd, he darted through it with all the speed he was master of; nor did he stop till he reached his carriage, which drove him directly home. Mr. Cavendish died on February the 4th, 1810, aged seventy-eight years, four months, and six days. His appearance did not much prepossess strangers in his favor; and in his speech he had an impediment. His education seems to have been very complete; for he was an excellent mathematical scholar, a profound electrician, and a most acute and ingenious chemist. He never ventured to give an opinion upon any subject, unless he had studied it to the bottom. The whole of his literary labors consist of seventeen papers, published in the Philosophical Transactions, and occupying each only a few pages; but full of the most important discoveries, and the most profound investigations. Ten of them treat of chemical subjects, two of electricity, two of meteorology, and three relate to asronomy.

CAVE'SSON, *n.* Fr. *cavesson, caveçon*; Ital. and Span. *cabesson*; Lat. *capistrum*. In horsemanship, a sort of noseband, sometimes made of iron, and sometimes of leather or wood; sometimes flat, and sometimes hollow or twisted; which is put upon the nose of a horse, to forward the suppling and breaking of him.

> An iron *cavesson* saves and spares the mouths of young horses when they are broken; for, by the help of it, they are accustomed to obey the hand, and to bend the neck and shoulders, without hurting their mouths, or spoiling their bars with the bit.
>
> *Farrier's Dict.*

CAUF, Goth. *kaf, kafa*. A chest with holes in the top, to keep fish alive in the water.

CAUHQ-ROY, in natural history, a fossil which the natives of the East Indies calcine, and give in large doses in the hiccough, and pulmonary complaints. It is also used in dyeing. It is a kind of ochre, or clayey iron ore, found in great abundance in the hills. Iron is sometimes extracted from it.

CAVIA, the cavy, in zoology, a genus of quadrupeds, belonging to the order of glires. They have two wedge-like cutting teeth in each jaw; eight grinders in both. The fore feet have four or five toes; the hind three, four, or five each. The tail is very short or entirely wanting; and the collar bones are wanting. They seem to hold a middle place between the marine quadrupeds and the rabbit genus; and have a slow and mostly kind of leaping pace. They never climb trees, but dwell in hollow trees or in burrows which they dig in the earth; and live on vegetables. There are seven species, viz. 1. C. acuachy, the akouchy of Buffon, and olive cavy of Pennant, has a short tail; is olive colored above and whitish below. It inhabits Guiana, Cayenne, and Brasil; is about the size of a half grown rabbit; is easily tamed, and is esteemed delicate food. The female brings one or two at a litter. It inhabits woods, and lives on fruits. They are natives of Brasil. 2. C. aguti, the agouty, has a very short tail, the upper parts are brown, mixed with red and black; the rump a bright orange, and the belly yellowish. They inhabit South America and the West India Islands. They search for their food through the day, and carry it home to their dwellings, where they hoard what they cannot eat. They feed sitting on their hind legs, and carry their food with their fore paws to their mouth. Their flesh is savoury like that of a rabbit. They grunt like pigs, and are very voracious. When angry they beat the ground with their feet. 3. C. aperea, the aperea, or Brasilian coney, has no tail; is reddish above, and white below; has short ears; four toes before and three behind, the middle one longest; the upper lip divided; the fore feet black and naked. It lives in holes of rocks, from which it is hunted by small dogs. It is about a foot long, and runs like a hare. The flesh resembles that of a rabbit, but excels it in flavor. 4. C. capybara, the sus hydrochæris of Linnæus, or river hog of Dampier, has five webbed toes guarded by hoofs, on the hind feet, but no tail; is above two feet and a half long; the head and nose are large and thick; the eyes black; the ears small, erect, rounded and naked; the upper jaw long; and the upper lip divided. The neck and legs are short, and the hair is harsh like bristles. These animals inhabit the east of South America, from the isthmus to Brasil and Paraguay; live in fenny woods near rivers; swim, dive, and keep under water; catch fish at night, but bring them on shore and eat them sitting on their hind legs, like apes. They feed also on vegetables. They keep together in large herds, and make a noise, like the braying of asses. 5. C. cobaya, the mus porcellus, guinea pig, or pig-like mouse of Linnæus, and the restless cavy of Pennant, has four toes on the fore, and three on the hind feet, but no tail: the color is white, variegated with irregular orange and black blotches. The body is thick, and seldom exceeds seven inches in length. They have short broad ears, and large prominent brownish eyes; are very restless, and grunt continually like young pigs. They feed on bread, grain, fruits, &c.; are very delicate, and cannot bear cold or moisture. The female breeds at three months old; goes with young three weeks, and brings from four to twelve at a birth, though she has only two teats. 6. C. magellanica, the Patagonian hare or cavy, is so large as to weigh sometimes twenty-six pounds. It has long legs, with four toes before, and three behind, armed with long black claws; hardly any tail; the nose has tufts of curly hair, and long numerous whiskers; the ears are long and dilated; the upper lip divided; the face and back ash-colored; breast and sides tawny; the belly a dirty white. It inhabits the country about Port Desire in Patagonia. The flesh is white and well flavored. It feeds on vegetables, and burrows in the ground. 8. C. paca, the mus paca of Linnæus, or spotted cavy of Pennant, has five toes on all the feet; and the sides are marked with rows of gray or pale yellow spots. The body and head measure about two feet in length; the tail is like a small button, and so extremely short as to be hardly apparent; the mouth is very small; the upper lip divided; the nostrils are very large, and the muzzle is garnished with long whiskers; the ears are short and roundish; the eyes are large, prominent, and brownish; the two cutting teeth in each jaw are very long and of great strength; the hind legs are longer than the fore. This species inhabits Brasil, Guiana and probably all the warmer parts of America. It lives in fenny places near rivers, burrowing in the ground, and keeping its hole exceedingly clean, to which it has always three distinct outlets. It grows very fat, and is esteemed a great delicacy. The female has two teats situate between the hind thighs, and has only a single young one at a litter.

CAVIA'RE, *n.* }
CA'VIER. } 'The etymology is uncertain,' says Johnson, 'unless it come from Lat. *garum*, sauce or pickle, made of fish salted.' Its Russian name is *ikari*. Todd is of opinion that it is adopted from the barb. Greek *καβιαρι* or *καυιάρι*.

> The eggs of a sturgeon, being salted and made up into a mass, were first brought from Constantinople by the Italians, and called *caviare*. *Grew's Museum.*

CAVIARE, the hard roes of the sturgeon, are formed into small cakes, about an inch thick

S 2

and three or four inches broad, by taking out all the nerves or strings; then washing the spawn in white wine or vinegar, and spreading it on a table. It is then salted and pressed in a fine bag; after which it is cased up in a vessel with a hole at the bottom, that if any moisture is left it may run out. Caviare is in great request among the Muscovites, on account of their three Lents, which they keep with a superstitious exactness. The Italians settled at Moscow carry on a very great trade in it throughout that empire, there being a prodigious quantity of sturgeon taken at the mouth of the Wolga and other rivers which fall into the Caspian sea. A pretty large quantity of caviare is also consumed in Italy and France. They get it from Archangel, but commonly buy it of the English and Dutch. According to Savary, the best caviare brought from Muscovy is prepared from the belluga, which is much preferable to that made of the spawn of sturgeon. A kind of caviare, or rather sausage, is also made from the spawn of some other fishes; particularly a sort of mullet caught in the Mediterranean.

CA'VIL, *v.* & *n.*
CAVILLA'TION, *n.*
CA'VILLER, *s.*
CA'VILLINGLY, *adv.*
CA'VILLINGNESS, *n.*
CA'VILLOUS, *adj.*
CA'VILLOUSLY, *adj.*

Fr. *caviller;* Ital. *cavillare;* Span. *cavilar;* Lat *cavillor*. To cavil is to carp; to raise captious, frivolous, verbal objections; to contest about trifles; to wrangle without a solid reason; to receive with objections. It was once used in the sense of to mock, to scoff. The caviller is a character who has a strong relationship with the captious man; the former, however, is less disposed perhaps to quarrel than the latter, less snappish, but equally teazing. Cavillation formerly meant a merry taunt, a subtle forged tale, but is now confined to the practice of making captious objections.

I'll give thrice so much land
To any well-deserving friend;
But, in the way of bargain, mark ye me,
I'll *cavil* on the ninth part of a hair. *Shakspeare.*

My lord, you do not well in obstinacy
To *cavil* in the course of this contract. *Id.*

I might add so much concerning the large odds between the case of the eldest churches in regard of heathens, and ours in respect of the church of Rome, that very *cavillation* itself should be satisfied. *Hooker.*

Wiser men consider how subject the best things have been unto *cavil*, when wits, possessed with disdain, have set them up as their mark to shoot at. *Id.*

Socrates held all philosophers *cavillers* and madmen. *Burton's Anat. Mel.*

Thou didst accept them: wilt thou enjoy the good,
Then *cavil* the conditions? *Paradise Lost.*

Since that so *cavillously* is urged against us.
Milton. Art. of Peace.

Several divines, in order to answer the *cavils* of those adversaries to truth and morality, began to find out fárther explanations. *Swift.*

He *cavils* first at the poet's insisting so much upon the effects of Achilles's rage. *Pope's Notes on the Iliad.*

The candour which Horace shews, is that which distinguishes a critic from a *caviller*. *Addison.*

Those persons are said to be *cavillous* and unfaithful advocates, by whose fraud and iniquity justice is destroyed. *Ayliffe.*

Let *cavillers* deny
That brutes have reason: sure 'tis something more;
'Tis Heaven directs, and stratagems inspires,
Beyond the short extent of human thought. *Somervile.*

CA'VIN, *n.*, in the military art, a natural hollow, fit to cover a body of troops, and consequently facilitate their approach to a place.

CAUK, *n.*
CAU'KY, *adj.*

A coarse talky spar.

A white, opaque, *cauky* spar, shot or pointed.
Woodward.

CAUL, *n.* Isl. *koll;* Per. *kulah;* Goth. *kulle*. A net for women's hair; the hind part of a woman's cap; any kind of small net; the omentum; vulgarly, the membrane which sometimes envelopes the head of a child at the birth, and is superstitiously believed to be a preservative from being drowned.

Let see which is the proudest of hem alle,
That wereth or a kerchef or a *calle*,
That dare say nay of what I shall you teche.
Chaucer. Cant Tales.

A solemn silence was proclaimed, the judges sat and heard,
What truth could tell, or craft could fain, and who should be preferred:
Then beauty stept before the bar, whose breast and neck was bare,
With hair trust up, and on her head a *caul* of gold she ware. *Surrey.*

Ne spared they to strip her naked all,
Then when they hed despoiled her tire and *caul*,
Such as she was, their eyes might her behold.
Spenser.

Her head with ringlets of her hair is crowned,
And in a golden *caul* the curls are bound.
Dryden Æneid.

An Indian mantle of feathers, and the feathers wrought into a *caul* of packthread. *Grew.*

The *caul* serves for the warming the lower belly, like an apron or piece of woollen cloth. Hence a certain gladiatour, whose *caul* Galen cut out, was so liable to suffer cold, that he kept his belly constantly covered with wool. *Ray.*

The beast they then divide, and disunite
The ribs and limbs, observant of the rite:
On these, in double *cauls* involv'd with art,
The choicest morsels lay. *Pope's Odyssey.*

CAUL, in midwifery, a small part of the placenta sometimes found on the head of the new born child, and formerly applied to several superstitious uses. To this day we sometimes see advertisements of this substance in the public papers; sailors considering it a protection against drowning.

CAULABAGH, a town of Caubul, in the province of Paishawur, on the west side of the river Indus. Near this place are large rocks of pure salt, and a considerable alum manufacture. All the houses are built on terraces cut out of the hill, and the river here is confined to a channel only about 400 yards wide. The town is sometimes called Khara Bagh, or the Garden of Salt.

CAULI'FEROUS. Lat. *caulis* and *fero*, a term in botany for such plants as have a true stalk.

CAULKING, or CAUKING, OF A SHIP, is driving very close a quantity of oakum, or old ropes untwisted and drawn asunder, into the seams of the planks, or into the intervals where the planks are

Let cavillers deny

ch as she was, their eyes might her behold. *Spenser.*

Her head with ringlets of her hair is crowned,
nd in a golden *caul* the curls are bound. *Dryden. Æneid.*

An Indian mantle of feathers, and the feathers
rought into a *caul* of packthread. *Grew.*

The *caul* serves for the warming the lower belly,
ce an apron or piece of woollen cloth. Hence a cer-
in gladiatour, whose *caul* Galen cut out, was so
ble to suffer cold, that he kept his belly constantly
vered with wool. *Ray.*

The beast they then divide, and disunite
e ribs and limbs, observant of the rite:
these, in double *cauls* involv'd with art,
e choicest morsels lay. *Pope's Odyssey.*

CAUL, in midwifery, a small part of the pla-
nta sometimes found on the head of the new
rn child, and formerly applied to several su-
rstitious uses. To this day we sometimes see
vertisements of this substance in the public
pers; sailors considering it a protection against
owning.

CAULABAGH, a town of Caubul, in the
ovince of Paishawur, on the west side of the
er Indus. Near this place are large rocks of
re salt, and a considerable alum manufacture.
l the houses are built on terraces cut out of
e hill, and the river here is confined to a chan-
l only about 400 yards wide. The town is some-
nes called Khara Bagh, or the Garden of Salt.

CAULI'FEROUS. Lat. *caulis* and *fero*, a
m in botany for such plants as have a true
lk.

CAULKING, or CAUKING, OF A SHIP, is driving
y close a quantity of oakum, or old ropes un-
and drawn asunder, into the seams of the
to the intervals where the planks are

joined together, in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven very hard into these seams, it is covered with hot melted pitch or resin, to keep the water from rotting it. Among the ancients, the first who made use of caulking, were the inhabitants of Phœacia, now Corfu. Wax and resin appear to have been commonly used previously to that period. The Poles use a sort of unctuous clay for the same purpose, on their navigable rivers.

CAULKING IRONS, iron chissels formed for caulking. Some of these are broad, some round, and others grooved.

CAU'PONATE. } Lat. *caupono*; to keep a
CA'UPONISE. } victualling-house; to sell

wine or victuals; to act as a sutler.

CAURSINES, CAURSINI, Italians who came into England about 1235, terming themselves the pope's merchants, but driving no other trade but letting out money; and having great banks in England, they differed little from Jews, except that they were more merciless to their debtors.

CAUSALTY, among miners, denotes the lighter, sulphureous, earthy part of ores, carried off in the operation of washing. This, in the mines, they throw in heaps upon banks, which in six or seven years they find it worth their while to work over again.

CAUSA MATRIMONII PRÆLOCUTI, in common law, a writ that lies where a woman gives land to a man in fee to the intent he shall marry her, and he refuses to do it in a reasonable time, being required by the woman; and in such case, for not performing thc condition, the entry of the woman into the lands again has been adjudged lawful. The husband and wife may sue this writ against the person who ought to have married her.

CAUSE, *v.* & *n.*
CA'USAL, *adj.*
CAUSA'LITY, *n.*
CAU'SALLY, *adv.*
CAUSA'TION, *n.*
CA'USATIVE, *adj.*
CAUSA'TOR, *n.*
CA'USELESS, *adj.*
CA'USELESSLY, *adv.*
CA'USER, *n.*

Lat. *causa*. Etymologists have been woefully at fault, with respect to the origin of this word. It has been seriously traced to chaos, because all things sprung from chaos; to *καρειν*; a cavendo; a casu; and to caiso; but nothing satisfactory has been written on the subject. A cause signifies that which produces or effects any thing; the reason, the agent, the inducing, or motive, power; reason of debate; subject of litigation; side, party, ground or principle of action or opposition. To cause, is to effect, to bring about; to produce. There is an obsolete usage of the verb, meaning to give a cause or reason which is trivial, not valid. Causable is that which may be caused; causal, is relating to, implying, or containing causes; causality, is the agency of a cause; causally, according to the order, or series of causes; causation, the act or capability of causing. In grammar, causative denotes that which expresses a cause or reason.

When he withstandeth our temptation,
It is a *cause* of his salvation.
Chaucer's Canterbury Tales.

Yet is my truth yplight
And love avowed to other lady late,
That, to remove the same, I have no might
To change love *causeless*, is reproach to warlike
knight. *Spenser's Faerie Queene.*

His whole oration stood upon a short narration, which was the *cause* of this metamorphosis. *Sidney.*

Never was man whose apprehensions are sober, and by a pensive inspection advised, but hath found by an irresistible necessity one everlasting being, all for ever *causing*, and all for ever sustaining. *Raleigh.*

The rest shall bear some other sight,
As *cause* will be obeyed. *Shakspeare.*

O madness of discourse!
That *cause* sets up with and against thyself. *Id.*

Is not the *causer* of these timeless deaths
As blameful as the executioner. *Id.*

The wise and learned, amongst the very heathens themselves, have all acknowledged some first *cause*, whereupon originally the being of all things dependeth: neither have they otherwise spoken of that *cause*, than as an agent, which, knowing what and why it worketh, observeth, in working, a most exact order or law. *Hooker.*

Human laws are not to be broken with scandal, nor at all without reason; for he that does it *causelessly*, is a despiser of the law, and undervalues its authority. *Taylor's Holy Living.*

Spices *cause* hot and head melancholy, and are for that *cause* forbidden by our physicians, to such men as are inclined to this malady, as pepper, ginger, cinnamon, cloves, mace, dates, &c., honey and sugar. *Burton. Anat. Mel.*

Well hast thou fought
The better fight, who single hast maintained,
Against revolted multitudes, the *cause*
Of truth, mightier than they in arms. *Milton.*

That may be miraculously effected in one, which is naturally *causable* in another. *Browne's Vulgar Errours.*

As he created all things, so is he beyond and in them all, in his very essence, as being the soul of their *causalities*, and the essential *cause* of their existence. *Id.*

Thus may it more be *causally* made out, what Hippocrates affirmeth. *Id.*

Demonstratively understanding the simplicity of perfection, and the invisible condition of the first *causator*, it was out of the power of earth, or the areopagy of hell, to work them from it. *Id.*

Thus doth he sometimes delude us in the conceits of stars and meteors, besides their allowable actions, ascribing effects thereunto of independent *causation*. *Id.*

As women yet who apprehend
Some sudden *cause* of *causeless* fear,
Although that seeming *cause* take end,
A shaking through their limbs they find. *Waller*

Yet he does himself excuse,
Nor indeed without a *cause*,
For, according to the laws,
Why did Chloe once refuse. *Marvell,*

So great, so constant, and so general a practice, must needs have not only a *cause*, but also a great, a constant, and a general *cause*, every way commensurate to such an effect. *South.*

Cause is a substance exerting its power into act, to make one thing begin to be. *Locke*

Things that move so swift as not to affect the senses distinctly, and so *cause* not any train of ideas in the mind, are not perceived to move. *Id.*

Reach the Almighty's sacred throne,
And make [illegible] power, the *cause* of all things known
Blackmore's Creation.

Ere to thy *cause*, and thee, my heart inclined,
Or love to party had seduced my mind. *Tickell.*

Says my uncle, I pray you discover,
What hath been the *cause* of your woes,
That you pine and you whine like a lover,
I have seen Molly Mog of the Rose. *Gay.*

Causal propositions are, where two propositions are joined by *causal* particles; as, houses were not built, that they might be destroyed; Rehoboam was unhappy, because he followed evil counsel. *Watts' Logic.*

Yet soon the dance will *cause* the cheeks to glow,
And melt the waxen lips, and neck of snow. *Bishop.*

Now, virtue, now thy powerful succour lend,
Shield them for liberty who dare to die!
Ah! Liberty! will none thy *cause* befriend?
Are these thy sons, thy generous sons that fly.
Beattie.

Not to understand a treasure's worth,
Till time has stolen away the slighted good,
Is *cause* of half the poverty we feel,
And makes the world the wilderness it is. *Cowper.*

Cause stands opposed to effect. We obtain the idea of cause and effect from observing the vicissitudes of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. Thus, fluidity in wax or metals, is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat; which we therefore style the cause.

Aristotle, and the schoolmen after him, distinguished four kinds of causes; the efficient, the material, the formal, and the final. This, like many of Aristotle's distinctions, is only a distinction of the various meanings of an ambiguous word; for the efficient, the matter, the form, and the end, have nothing common in their nature, by which they may be accounted a species of the same genus; but the Greek word, which we translate cause, had these four different meanings in Aristotle's days, and we have added other meanings. We do not indeed call the matter or the form of a thing its cause; but we have final causes, instrumental causes, occasional causes, and many others. Thus the word cause has been so hackneyed, and made to have so many different meanings in the writings of philosophers, and in the discourse of the vulgar, that its original and proper meaning is lost. With regard to the phenomena of nature, the important end of knowing their causes, is, that we may know when to expect them, or how to bring them about. This is very often of real importance in life; and this purpose is served, by knowing what, by the course of nature, goes before them and is connected with them; and this, therefore, we call the cause of such a phenomenon. If a magnet be brought near to a mariner's compass, the needle, which was before at rest, immediately begins to move, and bends its course towards the magnet, or perhaps the contrary way. If an unlearned sailor is asked the cause of this motion of the needle, he is at no loss for an answer. He tells you it is the magnet; and the proof is clear; for, remove the magnet, and the effect ceases; bring it near, and the effect is again produced. It is, therefore, evident to sense, that the magnet is the cause of this effect. A Cartesian philosopher enters deeper into the cause of this phenomenon. He observes, that the magnet does not touch the needle, and therefore can give it no impulse. He pities the ignorance of the sailor. The effect is produced, says he, by magnetic effluvia, or subtile matter, which passes from the magnet to the needle, and forces it from its place. He can even show you, in a figure, where these magnetic effluvia issue from the magnet, what round they take, and what way they return home again. And thus he thinks he comprehends perfectly how, and by what cause, the motion of the needle is produced. A Newtonian philosopher enquires what proof can be offered for the existence of magnetic effluvia, and can find none. He therefore holds it as a fiction, an hypothesis; and he has learned that hypotheses ought to have no place in the philosophy of nature. He confesses his ignorance of the real cause of this motion, and thinks that his business as a philosopher is only to find from experiment the laws by which it is regulated in all cases. These three persons differ much in their sentiments with regard to the real cause of this phenomenon; and the man who knows most is he who is sensible that he knows nothing of the matter. Yet all the three speak the same language, and acknowledge that the cause of this motion is the attractive or repulsive power of the magnet. What has been said of this, may be applied to every phenomenon that falls within the compass of natural philosophy. We deceive ourselves, if we conceive that we can point out the real efficient cause of any one of them. The grandest discovery ever made in natural philosophy, was that of the law of gravitation, which opens such a view of our planetary system, that it looks like something divine. But the author of this discovery was aware that he discovered no real cause, but only the law or rule according to which the unknown cause operates. Natural philosophers, who think accurately, have a precise meaning to the terms they use in the science; and when they pretend to show the cause of any phenomenon of nature, they mean by the cause a law of nature of which that phenomenon is a necessary consequence. The whole object of natural philosophy, as Newton teaches, is reducible to these two heads: first, by just induction from experiment and observation, to discover the laws of nature; and then to apply those laws to the solution of the phenomena of nature. This was all that this great philosopher attempted, and all that he thought attainable. And this indeed he attained in a great measure, with regard to the motions of our planetary system, and with regard to the rays of light. But supposing that all the phenomena, which fall within the reach of our senses, were accounted for from general laws of nature, justly deduced from experience; that is, supposing natural philosophy brought to its utmost perfection, it does not discover the efficient cause of any one phenomenon in nature. The laws of nature are the rules according to which the effects are produced; but there must be a the effect ceases; bring it near, and the effect is again produced. It is, therefore, evident to sense, that the magnet is the cause of this effect. A Cartesian philosopher enters deeper into the cause of this phenomenon. He observes, that the magnet does not touch the needle, and therefore can give it no impulse. He pities the ignorance of the sailor. The effect is produced, says he, by magnetic effluvia, or subtile matter, which passes from the magnet to the needle, and forces it from its place. He can even show you, in a figure, where these magnetic effluvia issue from the magnet, what round they take, and what way they return home again. And thus he thinks he comprehends perfectly how, and by what cause, the motion of the needle is pro- duced. A Newtonian philosopher enquires what proof can be offered for the existence of magne- ic effluvia, and can find none. He therefore olds it as a fiction, an hypothesis; and he has earned that hypotheses ought to have no place n the philosophy of nature. He confesses his gnorance of the real cause of this motion, and hinks that his business as a philosopher is only o find from experiment the laws by which it is egulated in all cases. These three persons iffer much in their sentiments with regard to e real cause of this phenomenon; and the man ho knows most is he who is sensible that he nows nothing of the matter. Yet all the three peak the same language, and acknowledge that e cause of this motion is the attractive or re- ulsive power of the magnet. What has been id of this, may be applied to every phenome- on that falls within the compass of natural phi- sophy. We deceive ourselves, if we conceive at we can point out the real efficient cause of ny one of them. The grandest discovery ever ade in natural philosophy, was that of the law f gravitation, which opens such a view of our lanetary system, that it looks like something ivine. But the author of this discovery was ware that he discovered no real cause, but only e law or rule according to which the unknown use operates. Natural philosophers, who think curately, have a precise meaning to the terms ey use in the science; and when they pretend show the cause of any phenomenon of nature, ey mean by the cause a law of nature of which at phenomenon is a necessary consequence. e whole object of natural philosophy, as New- n teaches, is reducible to these two heads: st, by just induction from experiment and ob- rvation, to discover the laws of nature; and en to apply those laws to the solution of the enomena of nature. This was all that the at philosopher attempted, and all that he ought attainable. And this indeed he attained a great measure, with regard to the motions our planetary system, and with regard to the s of light. But supposing that all the phe- mena, which fall within the reach of our senses, re accounted for from general laws of nature, tly deduced from experience; that is, sup- sing natural philosophy brought to its utmost rfection, it does not discover the efficient se of any one phenomenon in nature. The s of nature are the rules according to which effects are produced; but there must be a

cause which operates according to these rules. The rules of navigation never navigated a ship. The rules of architecture never built a house. Natural philosophers, by great attention to the course of nature, have discovered many of her laws, and have very happily applied them to account for many phenomena: but they have never discovered the efficientcause of any one phenomenon; nor do those who have distinct notions of the principles of the science make any such pretence. Upon the theatre of nature we see innumerable effects, which require an agent endowed with active power; but the agent is behind the scene. Whether it be the Supreme Cause alone, or a subordinate cause or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, and their different offices may be, are things hid, doubtless for wise reasons, from the human eye.

Cause, in medical language. The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed the disorders immediately cease. The doctrine of the causes of diseases is called etiology. Physicians divide causes into procatarctic, proximate, and remote.

Cause, procatarctic, *αιτια προκαταρκτικα*, or primitive incipient, is either an occasion which of its own nature does not beget a disease, but happening on a body inclined to diseases occasions a fever, gout, &c. (such as watching, fasting, and the like), or an evident and manifest cause which immediately produces the disease, as being sufficient thereto; such as a sword in respect of a wound.

Cause, proximate, that principle in the body, which being present, the disease is also present; or, which being removed, the disease is taken away; such as the stone in a nephritic patient, the virus of the small pox, syphilis, &c.

Cause, remote, predisponent, or antecedent, *αιτια προηγουμενη*, a latent disposition of the body, from whence some disease may arise; such as a plethora in respect of a fever, or cacochymia in respect of a scurvy.

Causeway, Devil's, a famous road of stones and rubbish, which ranges through the county of Northumberland, commonly supposed to be Roman.

Causeway, Giant's, a huge pile of Basaltic columns in Antrim, Ireland. See Basaltes, and Giant's Causeway.

CA'USEY, or } Fr. *chaussée*; Ital. *calzata*;
Ca'useway, *n.* } Scot. *calsey*; Mid. Lat. *calceata*. A raised, paved path; a path elevated above the rest of the ground. Causeway is an incorrect spelling.

To Shuppim the lot came forth westward by the *causey*. 1 *Chron.* xxvi. 16.

The other way Satan went down,
The *causeway* to hell-gate. *Milton.*

But that broad *causey* will direct your way.
And you may reach the town by break of day.
Dryden.

Whose *causeway* parts the vale with shady rows?
Whose seats the weary traveller repose? *Pope.*

CAUSTIC Curve, in the higher geometry, a curve formed by the concourse or coincidence of the rays of light reflected from some other curve.

CA'USTICAL, *adj.* } Fr. *caustique*; Lat.
Causti'city, *n.* } *causticus*; καυστικος. That
Ca'ustick, *n.* & *adj.* } which can burn. A
Ca'ustickness, *n.* } burning application. It usually designates a chemical preparation intended to destroy some part of the flesh; figuratively, a bitter, sarcastic speaker.

If extirpation be safe, the best way will be by *caustical* medicines, or escaroticks. *Wiseman's Surg.*

I proposed eradicating by escaroticks, and began with a *caustic* stone. *Id.*

Air too hot, cold, and moist, abounding perhaps with *caustic*, astringent, and coagulating particles.
Arbuthnot.

It was a tenderness to mankind, that introduced corrosives and *caustics*, which are indeed but artificial fires. *Temple.*

The piercing *caustics* ply their spiteful power,
Emetics ranch, and keen cathartics scour. *Garth.*

Causticity, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is proscribed by most physicians. Several others, as nitrous acid, lapis infernalis or lunar caustic, common caustic, and butter of antimony, are daily and successfully used to consume fungous flesh, to open issues, &c. They succeed very well when properly employed and skilfully managed.

Caustics are generally divided into four sorts; the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See Causticity, Chemistry, and Pharmacy.

CA'UTEL, *n.* } Old Fr. *cautelle*, *cau-*
Ca'utelous, *adj.* } *teleux*, *cauteller*; Lat.
Ca'utelously, *adv.* } *cautus*. 'Cautelle,' says
Ca'utelousness, *n.* } Sherwood, 'a wile, cau-
Ca'utelty, *n.* } telle, sleight; a crafty reach or fetch; guileful devise or endeavour; also craft, subtiltie, trumperie, deceit, cousenage. Cauteller, to deceive, beguile, cousen, overreach.' These definitions are so full, that it is unnecessary to say more in addition, than that cautel sometimes was used in the sense of a caution. Cautelous and cautelously had, also, in former times, an innocent as well as a sinister meaning; they stood for cautious, wary, provident.

Of themselves, for the most part, they are so *cautelous* and wily-headed, especially being men of so small experience and practice in law matters, that you would wonder whence they borrow such subtilties and sly shifts. *Spenser on Ireland.*

Perhaps he loves you now,
And now no soil of *cautel* doth besmirch
The virtue of his will. *Shakspeare.*

Your son
Will or exceed the common, or be caught
With *cautelous* baits and practice. *Id.*

Palladio doth wish, like a *cautelous* artisan, that the inward walls might bear some good share in the burden. *Wotton.*

All pretorian courts, if any of the parties be laid asleep, under pretence of a retirement, and the other

party doth cautelously get the start and advantage; yet they will set back all things in statu quo prius.
Bacon.

The Jews, not resolved of the sciatica side of Jacob, do *cautelously*, in their diet, abstain from both.
Browne.

CA'UTERIZE, *v.*
CAUTERIZA'TION, *n.*
CA'UTERIZING, *n.*
CA'UTERISM, *n.*
CA'UTERY, *n.*

Fr. *cauteriser*; Lat. *cauterium*; *καυτηριον*. To cauterise is to burn the flesh with a hot iron, which is called the actual cautery, or with some chemical caustic, which is denominated the potential cautery. Cauterising signifies burning with a cautery. Cauterism is the application of cautery.

For each word a blister, and each false
Be as a *cauterizing* to the root o' th' tongue,
Consuming it with speaking. *Shakspeare.*

No marvel though cantharides have such a corrosive and *cauterizing* quality; for there is not one other of the insecta but is bred of a duller matter.
Bacon's Natural History.

In heat of fight it will be necessary to have your actual *cautery* always ready; for that will secure the bleeding arteries in a moment. *Wiseman's Surgery.*

The design of the *cautery* is to prevent the canal from closing; but the operators confess that, in persons *cauterized*, the tears trickle down ever after.
Sharp's Surgery.

CAUTERISATION, in medicine, the art of burning flesh. In some places they cauterise with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver; Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron. Cauterising irons are of various figures: some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied through a capsula, to prevent any terror from the sight of it. This method was invented by Placentinus, and described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaster, or lint moistened in oxycrate. Sometimes the hot iron is transmitted through a copper canula, for the greater safety of the adjoining parts. The degrees and manners of cauterising are varied according to the nature of the disease and the part affected.

CAUTERY, in surgery, a medicine for burning, eating, or corroding any solid part of the body. See PHARMACY.

CA'UTION, *v.* & *n.*
CA'UTIONAL, *adj.*
CA'UTIONARY, *adj.*
CA'UTIOUS, *adj.*
CA'UTIOUSLY, *adv.*
CA'UTIOUSNESS, *n.*

Fr. *caution*; It. *cauto*; Span. *caucion*; Lat. *cautio*. The verb signifies to warn; to apprise of a danger. The noun bears the various meanings of wariness; provident care to avert danger or evil; security for and against; a provisionary precept; warning. Cautionary is a pledge given as a security; and, also, a hint of something to be avoided.

Such conditions, and *cautions* of the condition, as might assure with as much assurance as worldly matters bear. *Sidney.*

The Cedar, upon this new acquest, gave him part of Baccharia for *caution* for his disbursements.
Howell.

I could not but approve their generous constancy and *cautiousness*. *King Charles.*

The parliament would yet give his majesty sufficient *caution* that the war should be prosecuted.
Clarendon.

I am made the *cautionary* pledge,
The gage and hostage of your keeping it.
Southerne.

They know how fickle common lovers are;
Their oaths and vows are *cautiously* believed;
For few there are but have been once deceived.
Dryden.

In despite of all the rules and *cautions* of government, the most dangerous and mortal of vices will come off. *L'Estrange.*

How shall our thought avoid the various snare:
Or wisdom to our *cautioned* soul declare
The different shapes thou pleasest to employ,
When bent to hurt, and certain to destroy? *Prior.*

Attention to the forementioned symptoms affords the best *cautions* and rules of diet, by way of prevention. *Arbuthnot.*

We should always act with great *cautiousness* and circumspection, in points, where it is not impossible that we may be deceived. *Addison.*

Is there no security for the island of Britain? Has the enemy no *cautionary* towns and sea-ports to give us for securing trade? *Swift.*

Be *cautious* of him; for he is sometimes an inconstant lover, because he hath a great advantage. *Id.*

To flutter here, to flutter there, on wing;
To talk, to tease, to simper or to sing.
To prude it, to coquette it,—him to trust,
Whose vain, loose life should *caution*, or disgust. *Id.*

This shall direct thy *cautious* tread aright,
Though not one glaring lamp enliven night. *Gay.*

For youth alas, nor *cautious* age,
Nor strength, nor speed, eludes their rage.
Beattie.

There is a courageous wisdom: there is also a false reptile prudence, the result not of *caution* but of fear.
Burke.

'Life's a poor player.'—Then, 'play out the play,
Ye villains!' and above all keep a sharp eye,
Much less on what you do than what you say;
Be hypocritical, be *cautious*, be
Not what you seem, but always what you see.
Byron's Don Juan.

CAUVERY, or CAVERY, a noble river of Hindostan, in the province of Tanjore, which rises near the coast of Malabar, among the Coory hills, and passing through the Mysore, near Seringapatam, below the Ghauts, falls into the sea by several mouths, after a course of nearly 400 miles. The island of Seringham is opposite to Trichinopoly, formed by it.

To CAW, *v. n.* A word imitative of the sound. To cry as the raven, or crow: a term of reproach.

Russet-pated choughs, many in sort,
Rising and *cawing* at the gun's report.
Shakspeare.

A walk of aged elms, so very high, that the rooks and crows upon the tops seem to be *cawing* in another region. *Addison.*

The rook, who high amid the boughs,
In early spring, his airy city builds,
And ceaseless *caws*. *Thomson's Spring.*
Cawing rooks, and kites that swim sublime
In still repeated circles, screaming loud,

ae.

f Peru, as being the residence of
emperor Atahualpa, the last of

the Peruvian incas, when the celebrated Pizarro landed at Tumpai, near the mouth of the Guayaquil. Here are still shown a large room, part of the old palace, and the residence of the cacique Astopilco, where this ill-fated monarch was kept a prisoner for the space of three months, or from the first day of his meeting Pizarro to the day on which he was murdered by order of that general; and in this room is the mark which he made on the wall, promising to fill it to that height with silver and gold as a ransom. In the chapel belonging to the common gaol, which was formerly part of the palace, the altar stands on the stone on which Atahualpa was placed by the Spaniards and strangled, and under which he was buried. Near the fountain in the plasa are also visible the foundation stones of the small battery erected by Pizarro, in the front of which Valverde delivered his famous harangue to the inca, and whence he commanded the Spanish soldiers to massacre the Indians. About a league from the city are the baths where the inca was living when Pizarro arrived; the one on the right hand is called the bath of the inca. The present population of this city is about 12,000. See *Mr. Stephenson's Twenty Years' Residence in South America*, vol. ii.

CAXAMARQUILLA, PATAZ, or PATA, a town and province of Peru, bounded on the east by the mountainous Indian country, on the north-east and north by the province of Chachapoyas, on the west and north-west by the river Amazons, here called the Tunguragua, which separates it from the provinces of Caxamarca, Guamachuco, and Conchucos; and on the south by that of Huamalies. It is seventy-eight miles long from north to south, and eighteen wide. From the east boundary of this province flow the principal tributary streams of the Amazons. It is of very diversified temperature, but, in the warm and temperate regions, very productive in wheat, maize, bark, potatoes and sugar. There are also some gold and silver mines in the province. Population about 8,000. This is likewise the name of several small settlements of Peru. The capital is in latitude 7° 36′ S.

CAXATAMBO, a mountainous and cold province of Peru, bounded on the north by the province of Huailas, or Guailas, on the north-east by that of Conchuios, on the east by that of Huamalies, or Guamalies, on the south-east by that of Tarma, on the south by that of Chancay, and on the north-west by that of Santa. It is 100 miles from north-east to south-west, and about the same extent from north-west to south-east. It produces grain and cochineal, and abounds in cattle, seeds, and fruits, and still more in sheep, from the fleece of which its inhabitants manufacture a cloth peculiar to the province. Caxatambo, the chief town, is in lat. 10° 27′ S.

CA'XON, *n.* A burlesque appellation of a wig.

> The nuptials to grace, came from every quarter
> The worthies of Rag Fair, old *caxons* who barter;
> Who the coverings of judges and counsellors' nobs,
> Cut down into majors, queus, scratches, and bobs.
> *Huddesford.*

CAXON, in metallurgy, a chest of ores of silver, or any other metal that has been burnt, ground, and washed, and is ready to be refined.

CAXTON (William), commonly known as the first English printer, as, although Corsellis brought wooden types from Haerlem, yet Caxton was the first who used fusile types in England. He was born in Kent about the year 1412, and was apprenticed to a mercer of London. On his master's death, he was appointed agent for that company in the Low Countries, and was also employed, together with R. Whitehall, Esq. by Edward IV. to conclude a commercial treaty with the duke of Burgundy. During his residence in Flanders he acquired a knowledge of the new invention of printing, and the first book he executed was the Recuyell of the History of Troy, translated by himself from the French, 1471. On his return to England, he set up a press near Westminster Abbey, and the first book there printed was, as far as can be ascertained, the Game of Chesse. In the Bodleian library there is a copy of Æsop's Fables, printed by Caxton, which is believed to be the first book which has its leaves numbered. After living to upwards of eighty, he died in 1494.

CAYANG, in botany, a leguminous plant, cultivated in the Mogul dominions for food. It is a kind of coarse pulse; of which the Europeans use great quantities on ship-board in the East Indies. It is a species of the cytisus.

CAYENNE, an island of French Guiana, South America, about eighteen miles in length from north to south, and ten miles broad. It is separated from the main land of Guiana by the river Cayenne, and the Ouya. The soil towards the north is fertile and pleasant, but southward the country is flat, and abounds in marshy meadows, which are inundated periodically. Horses, cattle, goats, and sheep, abound every where. This island is well known to have given name to the pepper capsicum minimum which is now obtained, however, both in the East and West Indies. This island was first settled by the French in 1625, and abandoned by them in 1654, when the English took possession of it, and were in their turn, compelled to leave it in 1664. The Dutch seized it in 1676, but it was recovered by France in the following year, and, though it capitulated to the British in 1809, was confirmed to its old masters at the peace of Paris in 1814. The north point is in 5° 0 N. lat., and long. 52° 15' W.

CAYENNE, the capital, stands on the north shores of the island, and is defended by the fort San Louis. The harbour is convenient, though small, and the town, built in the form of a regular hexagon, contains about 200 houses.

CAYLLAC, a sweet scented wood which grows in Siam; the Siamese and Chinese burn it in their temples.

CAYLUS (Count de), Marquis de Sternay, baron de Bransac, was born at Paris 1692. He entered into the corps of the mousquetaires; and in his first campaign, in 1709, he distinguished himself by his valor in such a manner, that Louis XIV. commended him before all the court. Upon the peace of Rastadt he travelled into Italy, and after a year's absence returned to Paris, and quitted the army. He then set out for the Levant, arrived at Smyrna, visited the ruins of Ephesus, and travelled through a great part of Europe and Asia. The Academy of Painting and Sculpture adopted him an honorary member in 1731; the academy of Belles Lettres conferred on him a similar honor in 1742. A fortunate accident soon after furnished him with the means of showing the composition and the coloring of the pictures of ancient Rome. The colored drawings which the famous Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the French king's cabinet with them, he gave a beautiful edition of them at his own expense. Amidst his researches, nothing afforded him so much pleasure as his discovery of encaustic painting. A description of Pliny's, but too concise to give a clear view of the matter, suggested the first idea of it. He availed himself of the skill of Dr. Magault, a celebrated chemist of Paris, and by repeated experiments found out the secret of incorporating wax with divers tints and colors, and of making it obedient to the pencil. Pliny mentions two kinds of encaustic painting practised by the ancients; one performed with wax, and the other upon ivory, with hot punches of iron. It was the former that count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection. In the hands of count Caylus, literature and the arts lent each other mutual aid. He published about forty dissertations in the Memoirs of the Academy of Belles Lettres, and founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. That he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 plates. To him the world is also indebted for that magnificent work, the Description of the Gems in the Royal Cabinet He died in September 1765. His monument, in the chapel of St. Germain l'Auxerrois, is perfectly the tomb of an antiquary. It was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had destined it to grace the place of his interment.

CAYMAN, in zoology, a species of alligator, found in the southern parts of America, and on the coast of Guinea. This animal is the scourge and terror of all the large rivers of South America. Their boldness is such that a cayman has been known to come into the centre of an assembly of people in a public walk, seize a full grown man and drag him into the bed of the river for food. This happened once at Angustura in the presence of the governor and several other persons. The following account of catching the cayman we quote from the Travels of Mr. Waterton in 1824. Having baited a large book with meat, they waited till one of these animals swallowed the bait, and they then had to pull him up and secure him. 'If you pull him up,' say the Indians, 'as soon as he sees you on the brink of the river, he will run at you and destroy you.' 'Never mind,' says our traveller, 'pull away, and leave the rest to me.'

or the Levant, arrived at Smyrna, visited the
uins of Ephesus, and travelled through a great
art of Europe and Asia. The Academy of
'ainting and Sculpture adopted him an honorary
nember in 1731; the academy of Belles Lettres
onferred on him a similar honor in 1742. A
ortunate accident soon after furnished him with
he means of showing the composition and the
oloring of the pictures of ancient Rome. The
olored drawings which the famous Bartoli had
aken there from antique pictures, fell into his
ands. He had them engraved; and, before he
nriched the French king's cabinet with them, he
ave a beautiful edition of them at his own ex-
ense. Amidst his researches, nothing afforded
im so much pleasure as his discovery of en-
austic painting. A description of Pliny's, he
o concise to give a clear view of the matter,
uggested the first idea of it. He availed him-
lf of the skill of Dr. Magault, a celebrated
hemist of Paris, and by repeated experiments
und out the secret of incorporating wax with
vers tints and colors, and of making it obe-
ent to the pencil. Pliny mentions two kinds
encaustic painting practised by the ancients;
e performed with wax, and the other upon
ory, with hot punches of iron. It was the for-
er that count Caylus had the merit of reviving;
d M. Muntz afterwards made many experi-
ents to carry it to perfection. In the hands of
unt Caylus, literature and the arts lent each
er mutual aid. He published about forty dis-
rtations in the Memoirs of the Academy of
lles Lettres, and founded a prize of 500 livres
e object of which is to explain, by means of
thors and monuments, the usages of ancient
tions. That he might enjoy with the whole
rld the treasures he had collected, he caused
em to be engraved, and gave a learned des-
ption of them in a work which he embellished
th 800 plates. To him the world is also
lebted for that magnificent work, the De-
iption of the Gems in the Royal Cabinet.
died in September 1765. His monu-
nt, in the chapel of St. Germain l'Auxerrois,
perfectly the tomb of an antiquary. It was
ancient sepulchral antique, of the most beau-
l porphyry, with ornaments in the Egyptian
te. From the moment he procured it, he had
tined it to grace the place of his interment.

CAYMAN, in zoology, a species of alligator,
nd in the southern parts of America, and on
coast of Guinea. This animal is the scourge
l terror of all the large rivers of South Am
. Their boldness is such that a cayman
been known to come into the centre of
assembly of people in a public walk,
e a full grown man and drag him into the
l of the river for food. This happened once
Angustura in the presence of the governor
several other persons. The following ac-
nt of catching the cayman we quote from the
vels of Mr. Waterton in 1824. Having baited
rge hook with meat, they waited till one of
e animals swallowed the bait, and they then
to pull him up and secure him. 'If you
him up,' say the Indians, 'as soon as he
on the brink of the river, he will run at
roy you.' 'Never mind,' says our
ay, and leave the rest to me.'

And accordingly he placed himself upon the shore, with the mast of the canoe in his hand, ready to force it down the throat of the crocodile as soon as soon as he made his appearance.

'By the time the cayman was within two yards of me, I saw, says Mr. Waterton, he was in a state of fear and perturbation. I instantly dropped the mast, sprung up and jumped upon his back, turning half round as I vaulted, so that I gained my seat with my face in a right position. I immediately seized his fore legs, and, by main force, twisted them on his back; thus they served me for a bridle.

'He now seemed to have recovered from his surprise, and probably fancying himself in hostile company, he began to plunge furiously, and lashed the sand with his long and powerful tail. I was out of reach of the strokes of it, by being near his head. He continued to plunge and strike, and made my seat very uncomfortable. It must have been a fine sight for an unoccupied spectator.

'The people roared out in triumph, and were so vociferous, that it was some time before they heard me tell them to pull me and my beast of burden farther inland. I was apprehensive the rope might break, and then there would have been every chance of going down to the regions under water with the cayman. That would have been more perilous than Arion's marine morning ride:—

> Delphini insidens, vada cœrula sulcat Arion.

'The people now dragged us above forty yards on the sand, it was the first and last time I was ever on a cayman's back. Should it be asked how I managed to keep my seat, I would answer, I hunted some years with Lord Darlington's fox hounds.'

CAYSTER, or Caystrus, in ancient geography, a river of Ionia, whose mouth Ptolemy places between Colophon and Ephesus; commended by the poets for the number of its swans. Its source was in the Montes Cilbiani.

CAYUGA, a river of North America, which falls into the Lake Erie on the south shore, about forty miles east of the mouth of Huron. Its mouth is capable of being navigated by sloops from the lake.

Cayuga Lake is in the state of New York and county of Onondaga. It extends north and south to the length of thirty-eight miles, its breadth varies from one to four miles, and its shore is very irregular. The north point is twenty-five miles south of lake Ontario. This lake freezes in winter about six or eight miles above the outlet; remaining open in the deeper parts. Lat. of the North Point 42° 28′ N. long. 76° 42′ W.

Cayuga is also in the state of New York, and was erected into a separate county in 1799. Its form is irregular. On the north, where it is narrow, it is bounded by Lake Ontario, east by Onondaga and Cortlandt counties, south by Tioga county, west by Seneca county. Its greatest length north and south is seventy miles; its greatest width is twenty miles. The whole area, which is broken and hilly, is computed at 845 square miles, or 540,800 acres. Calcareous petrifactions are frequent here, and salt springs are found, and wrought to a considerable exte also good limestone. The manufactures are woollen, linen, and cotton cloths. The county has also several flourishing iron works, distilleries and tanning establishments; it sends three members to Congress.

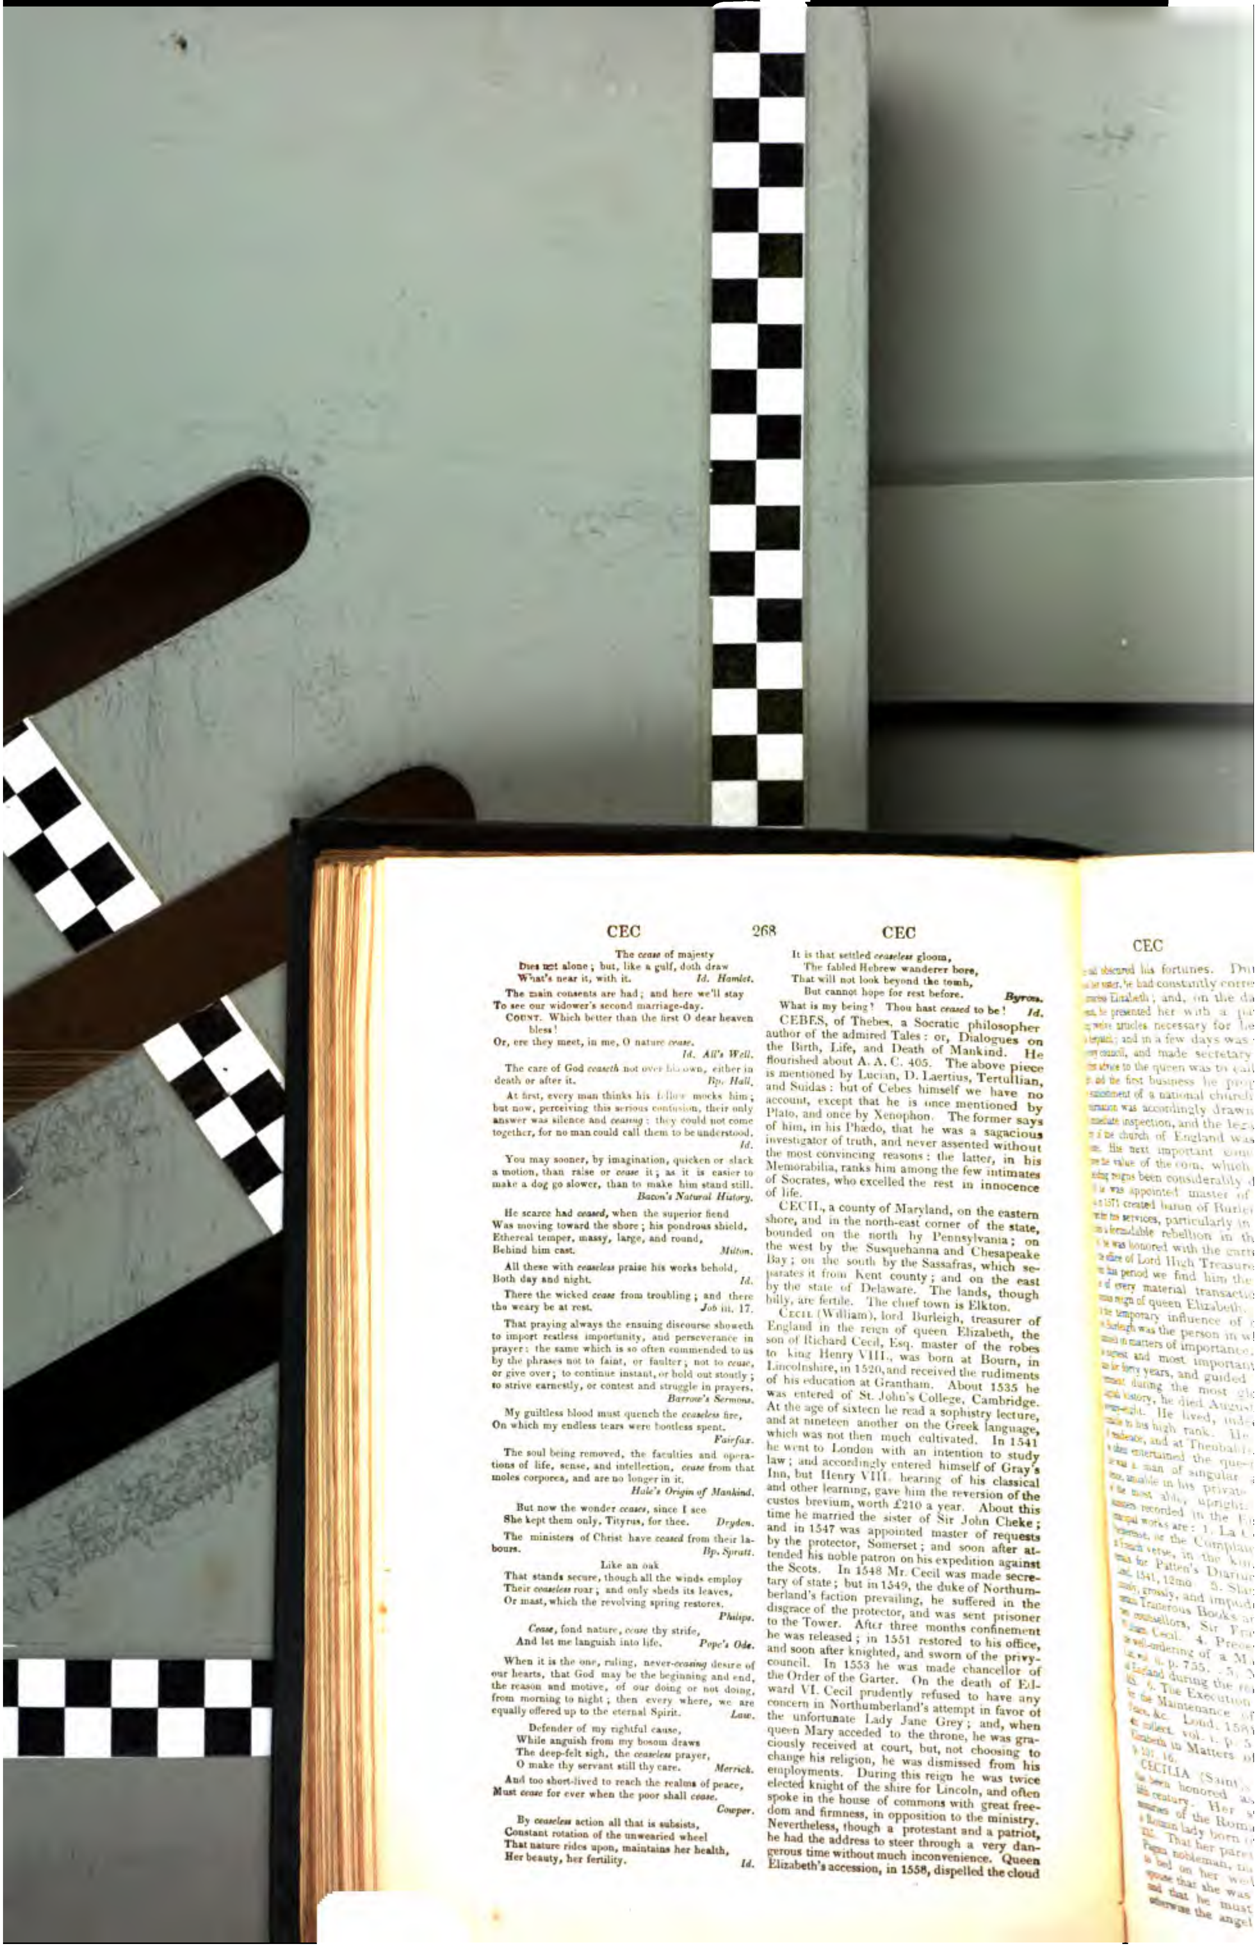
CAZIQUE, Cacique. See Cacique.

CEANOTHUS, New Jersey Tea, in botany, a genus of the monogynia order, and pentandria class of plants; natural order forty-third, dumosæ: cal. quinquepartite; petals five, pouched and arched: fruit a dry, trilocular, and trispermous berry. There are ten species, of which the most remarkable is the C. Americanus, a native of most parts of North America, from whence the seeds have been imported into Europe. In England this plant seldom rises more than three feet high. The stem, which is of a pale brown color, sends out branches from the bottom. These are thin, flexible, and of a reddish color, which has occasioned this tree to be called red twig. The leaves stand on reddish pedicles, about half an inch in length. They are oval, serrated, pointed, about two inches and a half long, are proportionably broad, and have three nerves running lengthwise. The flowers grow at the ends of the twigs in clusters: they are of a white color, and when in blow give the shrub a most beautiful appearance. Indeed, it seems to be almost covered with them, as there is usually a cluster at the end of nearly every twig: and the leaves which appear among them serve as ornaments only. This tree blows in July; and the flowers are succeeded by small brownish fruit, in which the seeds sometimes ripen in England. It is propagated by layers; or from seeds sown in pots of compost, consisting of two parts of virgin earth well tempered and one part sand, about a quarter of an inch deep. The young seedlings must be defended from extreme cold in winter, as well as from the parching drought in summer. The best time of layering is in summer, just before they begin to flower: At that time lay the tender twigs of the spring shoots in the earth, and nip off the end which would produce the flowers. Within fifteen months some of them will be rooted.

CEASE, *n.*, *v. n.* & *a.* Ce'aseing, *n.* Ce'aseless, Ce'aselessly.	Fr. *cesser*; Lat. & Ital. *cessare*; from *cedo*, to give place, give ground, retreat.

To stop, to quit, to leave, to depart from, to desist from being or doing; to put an end to; to discontinue; to decease, to die. It is followed by *from* before a noun.

> Therefore for Christ suffride in fleisch, be ye also aarmed bi the same thenking. for he that suffride in fleische *ceesside* fro synnes.
>
> *Wicklif's New Test.* 2 Pet. iv.
>
> Evermore joie ghe, withoute *ceesyng* preie ghe.
>
> *Id.* 1 Thess. v.
>
> Wash you, make you cleane: take away the euill of your workes from before mine eyes: *cease* to do euill. *Breeches Bible.* Isai. i.
>
> Get on your cloak, and haste you to lord Timon
> Importune him for my monies; be not *ceased*
> With slight denial. *Shakspeare. Timon of Athens.*
>
> *Cease* to persuade, my loving Proteus;
> Home-keeping youth have ever homely wits.
> *Id. Two Gentlemen of Verona.*



The *cease* of majesty
Dies not alone; but, like a gulf, doth draw
What's near it, with it. *Id. Hamlet.*

The main consents are had; and here we'll stay
To see our widower's second marriage-day.
COUNT. Which better than the first O dear heaven
bless!
Or, ere they meet, in me, O nature *cease*.
Id. All's Well.

The care of God *ceaseth* not over his own, either in death or after it. *Bp. Hall.*

At first, every man thinks his fellow mocks him; but now, perceiving this serious confusion, their only answer was silence and *ceasing*: they could not come together, for no man could call them to be understood. *Id.*

You may sooner, by imagination, quicken or slack a motion, than raise or *cease* it; as it is easier to make a dog go slower, than to make him stand still. *Bacon's Natural History.*

He scarce had *ceased*, when the superior fiend
Was moving toward the shore; his pondrous shield,
Ethereal temper, massy, large, and round,
Behind him cast. *Milton.*

All these with *ceaseless* praise his works behold,
Both day and night. *Id.*

There the wicked *cease* from troubling; and there the weary be at rest. *Job* iii. 17.

That praying always the ensuing discourse showeth to import restless importunity, and perseverance in prayer: the same which is so often commended to us by the phrases not to faint, or faulter; not to *cease*, or give over; to continue instant, or hold out stoutly; to strive earnestly, or contest and struggle in prayers. *Barrow's Sermons.*

My guiltless blood must quench the *ceaseless* fire,
On which my endless tears were bootless spent.
Fairfax.

The soul being removed, the faculties and operations of life, sense, and intellection, *cease* from that moles corporea, and are no longer in it. *Hale's Origin of Mankind.*

But now the wonder *ceases*, since I see
She kept them only, Tityrus, for thee. *Dryden.*

The ministers of Christ have *ceased* from their labours. *Bp. Spratt.*

Like an oak
That stands secure, though all the winds employ
Their *ceaseless* roar; and only sheds its leaves,
Or mast, which the revolving spring restores.
Philips.

Cease, fond nature, *cease* thy strife,
And let me languish into life. *Pope's Ode.*

When it is the one, ruling, never-*ceasing* desire of our hearts, that God may be the beginning and end, the reason and motive, of our doing or not doing, from morning to night; then every where, we are equally offered up to the eternal Spirit. *Law.*

Defender of my rightful cause,
While anguish from my bosom draws
The deep-felt sigh, the *ceaseless* prayer,
O make thy servant still thy care. *Merrick.*

And too short-lived to reach the realms of peace,
Must *cease* for ever when the poor shall *cease*.
Cowper.

By *ceaseless* action all that is subsists,
Constant rotation of the unwearied wheel
That nature rides upon, maintains her health,
Her beauty, her fertility. *Id.*

It is that settled *ceaseless* gloom,
The fabled Hebrew wanderer bore,
That will not look beyond the tomb,
But cannot hope for rest before. *Byron.*
What is my being? Thou hast *ceased* to be! *Id.*

CEBES, of Thebes, a Socratic philosopher author of the admired Tales: or, Dialogues on the Birth, Life, and Death of Mankind. He flourished about A. A. C. 405. The above piece is mentioned by Lucian, D. Laertius, Tertullian, and Suidas: but of Cebes himself we have no account, except that he is once mentioned by Plato, and once by Xenophon. The former says of him, in his Phædo, that he was a sagacious investigator of truth, and never assented without the most convincing reasons: the latter, in his Memorabilia, ranks him among the few intimates of Socrates, who excelled the rest in innocence of life.

CECIL, a county of Maryland, on the eastern shore, and in the north-east corner of the state, bounded on the north by Pennsylvania; on the west by the Susquehanna and Chesapeake Bay; on the south by the Sassafras, which separates it from Kent county; and on the east by the state of Delaware. The lands, though hilly, are fertile. The chief town is Elkton.

CECIL (William), lord Burleigh, treasurer of England in the reign of queen Elizabeth, the son of Richard Cecil, Esq. master of the robes to king Henry VIII., was born at Bourn, in Lincolnshire, in 1520, and received the rudiments of his education at Grantham. About 1535 he was entered of St. John's College, Cambridge. At the age of sixteen he read a sophistry lecture, and at nineteen another on the Greek language, which was not then much cultivated. In 1541 he went to London with an intention to study law; and accordingly entered himself of Gray's Inn, but Henry VIII. hearing of his classical and other learning, gave him the reversion of the custos brevium, worth £210 a year. About this time he married the sister of Sir John Cheke; and in 1547 was appointed master of requests by the protector, Somerset; and soon after attended his noble patron on his expedition against the Scots. In 1548 Mr. Cecil was made secretary of state; but in 1549, the duke of Northumberland's faction prevailing, he suffered in the disgrace of the protector, and was sent prisoner to the Tower. After three months confinement he was released; in 1551 restored to his office, and soon after knighted, and sworn of the privy-council. In 1553 he was made chancellor of the Order of the Garter. On the death of Edward VI. Cecil prudently refused to have any concern in Northumberland's attempt in favor of the unfortunate Lady Jane Grey; and, when queen Mary acceded to the throne, he was graciously received at court, but, not choosing to change his religion, he was dismissed from his employments. During this reign he was twice elected knight of the shire for Lincoln, and often spoke in the house of commons with great freedom and firmness, in opposition to the ministry. Nevertheless, though a protestant and a patriot, he had the address to steer through a very dangerous time without much inconvenience. Queen Elizabeth's accession, in 1558, dispelled the cloud

It is that settled *ceaseless* gloom,
The fabled Hebrew wanderer bore,
That will not look beyond the tomb,
But cannot hope for rest before. Byr

What is my being? Thou hast ceased to be!

CEBES, of Thebes, a Socratic philosophe
author of the admired Tales: or, Dialogues o
the Birth, Life, and Death of Mankind. H
flourished about A. A. C. 405. The above per
is mentioned by Lucian, D. Laertius, Tertullian
and Suidas: but of Cebes himself we have n
account, except that he is once mentioned by
Plato, and once by Xenophon. The former says
of him, in his Phædo, that he was a sagacious
investigator of truth, and never assented with
the most convincing reasons: the latter, in his
Memorabilia, ranks him among the few intimates
f Socrates, who excelled the rest in innocence
f life.

CECIL, a county of Maryland, on the eastern
hore, and in the north-east corner of the state,
ounded on the north by Pennsylvania; o
he west by the Susquehanna and Chesapeake
Bay; on the south by the Sassafras, which se-
arates it from Kent county; and on the east
y the state of Delaware. The lands, though
illy, are fertile. The chief town is Elkton.

Cecil (William), lord Burleigh, treasurer of
England in the reign of queen Elizabeth, the
on of Richard Cecil, Esq. master of the robes
king Henry VIII., was born at Bourn, in
incolnshire, in 1520, and received the rudiments
f his education at Grantham. About 1535 he
as entered of St. John's College, Cambridge
t the age of sixteen he read a sophistry lecture,
d at nineteen another on the Greek language,
hich was not then much cultivated. In 1541
e went to London with an intention to study
w; and accordingly entered himself of Gray's
n, but Henry VIII. hearing of his classical
d other learning, gave him the reversion of the
stos brevium, worth £210 a year. About this
me he married the sister of Sir John Cheke;
d in 1547 was appointed master of requests
the protector, Somerset; and soon after at-
nded his noble patron on his expedition against
e Scots. In 1548 Mr. Cecil was made secre-
y of state; but in 1549, the duke of Northum-
rland's faction prevailing, he suffered in the
grace of the protector, and was sent prisoner
the Tower. After three months confinement
was released; in 1551 restored to his office,
d soon after knighted, and sworn of the privy
uncil. In 1553 he was made chancellor of
Order of the Garter. On the death of Ed-
rd VI. Cecil prudently refused to have any
cern in Northumberland's attempt in favor of
unfortunate Lady Jane Grey; and, when
en Mary acceded to the throne, he was gra-
usly received at court, but, not choosing to
nge his religion, he was dismissed from his
ployments. During this reign he was twice
ted knight of the shire for Lincoln, and often
ke in the house of commons with great free-
n and firmness, in opposition to the ministry.
ertheless, though a protestant and a patriot,
had the address to steer through a very dan-
us time without much inconvenience. Queen
abeth's accession, in 1558, dispelled the cloud

which had obscured his fortunes. During the reign of her sister, he had constantly corresponded with princess Elizabeth; and, on the day of her accession, he presented her with a paper containing twelve articles necessary for her immediate despatch; and in a few days was sworn of the privy council, and made secretary of state. His first advice to the queen was to call a parliament; and the first business he proposed was the establishment of a national church. A plan of reformation was accordingly drawn up under his immediate inspection, and the legal establishment of the church of England was the consequence. His next important concern was to restore the value of the coin, which had in the preceding reigns been considerably debased. In 1561 he was appointed master of the wards; and in 1571 created baron of Burleigh as a reward for his services, particularly in having lately stifled a formidable rebellion in the north. In 1501 he was honored with the garter, and raised to the office of Lord High Treasurer of England. From this period we find him the primum mobile of every material transaction during the glorious reign of queen Elizabeth. Notwithstanding the temporary influence of other favorites, lord Burleigh was the person in whom she chiefly confided in matters of importance. Having filled the highest and most important offices of the state for forty years, and guided the helm of government during the most glorious period of English history, he died August 4th, 1598, aged seventy-eight. He lived, indeed, in a manner suitable to his high rank. He had four places of residence, and at Theobalds, his favorite seat, he often entertained the queen at vast expense. He was a man of singular abilities and prudence, amiable in his private character, and one of the most able, upright, and indefatigable ministers recorded in the English annals. His principal works are: 1. La Complainte de l'ame Pecheresse, or the Complaint of a Sinful Soul, in French verse, in the king's library. 2. Materials for Patten's Diarium, exped. Scoticæ. Lond. 1541, 12mo. 3. Slanders and Lies maliciously, grossly, and impudently vomited out, in certain Traiterous Books and Pamphlets, against two counsellors, Sir Francis Bacon, and Sir William Cecil. 4. Precepts or Directions for the well-ordering of a Man's Life, 1634. Harl. Cat. vol. ii. p. 755. . 5. Meditations on the State of England during the reign of Queen Elizabeth, MS. 6. The Execution of Justice in England for the Maintenance of Public and Christian Peace, &c. Lond. 1581, 1583, Somer's Tracts, 4th collect. vol. i. p. 5. 7. Advice to Queen Elizabeth in Matters of Religion and State, ib. p. 101. 16.

CECILIA (Saint), the patroness of music, has been honored as a martyr ever since the fifth century. Her story, as delivered by the notaries of the Roman church, is, that she was a Roman lady born of noble parents about A. D. 235. That her parents married her to a young Pagan nobleman, named Valerianus, who, going to bed on her wedding night, was told by his spouse that she was nightly visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus desired that he might see his rival the angel, but his spouse told him that was impossible, unless he would consent to become a Christian. This he consented to, and was baptised by Pope Urban I.; after which, returning to his wife, he found her in her closet at prayer, and by her side, the angel in the shape of a beautiful young man, clothed with brightness. After some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he wished to partake of the grace which he himself had received. The angel told him that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and his prophecy was soon fulfilled. Tiburtius was converted, and he and his brother were beheaded. Cecilia was offered her life if she would sacrifice to the Roman idols, but she refused; upon which she was thrown into a caldron of boiling water; others say that she was stifled in a dry bath, i.e. an enclosure, from whence the air was excluded, having a slow fire underneath. There is a tradition of St. Cecilia, that she excelled in music; and that the angel was drawn from the celestial regions by the charms of her melody. This has been deemed authority sufficient for making her the patroness of music. The above legend has given occasion to painters and sculptors to exercise their genius in representations of her playing on the organ or harp.

CE'CITY *n.* } *Cæcitas*, Lat. blindness;
Cecu'tiency. } or tendency to blindness; privation or cloudiness of sight.

> They are not blind, nor yet distinctly see; there is in them no *cecity*, yet more than a *cecutiency*; they have sight enough to discern the light, though not perhaps to distinguish objects or colors.
>
> *Browne's Vulgar Errours.*

CECROPIA, in botany, a genus of the diandra order and diœcia class of plants, natural order fifty-third, scabridæ. Male, spathe caducous, cunent imbricated with pear-shaped scales: cor. none. Female, germs imbricated: style one: stig. lacerated: seed, a one seeded berry. Species one only, C. pellala, snake wood or trumpet tree, a native of the West Indies and South America.

CECROPS I. and II., kings of Athens. See Attica.

CE'DAR. } Ang.-Sax. *ceder*; Fr. *cedre*;
Ce'darlike. } Lat. *cedrus*; κεδρος, a tree, of
Ce'darn. } which there are various spe-
Ce'drine. } cies. The description will be
Ce'dry. } found under the botanical names. Cedarn and cedrine, the former of which epithets is used in Milton's Comus, signify that which is of, or belonging to, the cedar tree. Evelyn uses the adjective cedry, to express cedar-colored.

> Wherever the bright sun of heaven shall shine,
> His honor, and the greatness of his name
> Shall be, and make new nations: He shall flourish,
> And, like a mountain *cedar*, reach his branches
> To all the plains about him.
>
> *Shakspeare. Henry VIII.*

> Growing gravity, so *cedar-like*. *Ben Jonson.*

He spake of trees, from the *cedar* tree, that is in Lebanon, euen unto the hyssope that springeth out of the wall.—[From the hiest to the lowest note.]
Breeches' Bible, 1 Kings, iv. 33.

There was nothing but white marble without; nothing but *cedar* and gold within. Upon the hill of Sion stands that glittering snowy pile, which both inviteth and dazzleth the eyes of passengers afar off: so much more precious within, as *cedar* is better than stone; gold than *cedar*. *Bp. Hall.*

Hark! his voice in thunder breaks;
Hushed to silence, while he speaks,
* * * * *
See, as louder yet they rise,
Echoing through the vaulted skies,
Loftiest *cedars* lie o'erthrown,
Cedars of steep Lebanon. *Merrick.*

Cedar, in botany. See Juniperus.

Cedar, Bastard. See Theobroma.

Cedar of Busaco. See Cupressus.

Cedar of Lebanon, called by the ancients cedrus magna, or the great cedar; also cedrelate, κεδρελατη. See Pinus.

Cedar, White. See Cupressus.

CEDE, Lat. *cedo, cedere.* To give place; to yield. In modern time applied to the yielding, giving up, or resigning by treaty, some object or place that has been contested. See Cession.

This fertile glebe, this fair domain,
Had well nigh *ceded* to the slothful hands
Of monks libidinous. *Shenstone.*

On the 10th of February (1697) Callieres, in the name of his master, agreed to the following preliminaries:—

'That Dinant should be *ceded* to the Bishop of Liege, and all reunion since the treaty of Nimeguen be made void: that the French king should make restitution of Lorraine, and, upon conclusion of the peace, acknowledge the prince of Orange as king of Great Britain without condition or reserve.' *Smollett.*

Much of the navigation of 1763 was also owing to the war; this is manifest from the large part of it employed in the carriage for the *ceded* islands, with which the communication still continued open.
Burke.

CEDRELA, in botany, a genus of the monogynia order, in the pentandria class of plants, natural order fifty-fourth, miscellaneæ: cal. withering: cor. quinquepetallous, funnel-shaped, and adhering to the receptaculum, a third of its length: caps. five-celled and five-valved: seed, winged and imbricated downward: species one only, C. novata, a tall tree growing in South America and the West Indies.

CEDRUS, the cedar-tree, mahogany, &c. See Juniperus, and Pinus.

CEFALU, a small city of Sicily, in the vale Demona, anciently called Cephaloedis. It is a bishop's see, and has a strong fort. This town has a considerable fishery, but the harbour will not contain above thirty or forty vessels. Long. 13° 13′ E., lat. 38° 5′ N.

CEIL, *v. a.* } Lat. *cælo*, Fr. *ciel*; *(heaven).*
Ceil'ing, *n.* } This word was written formerly (see below) siel; and is at the present time spelt both ciel, after the French word, (although Cotgrave contends it cannot come from that quarter, the plurals of ciel, heaven, and ciel, a canopy, being different) and ceil. To form the inner covering of a room or building, or to ornament it. 'A ceiled house,' la queatis, Vulg. in the Bible, Haggai i. 4, clearly means a superior and respectable house. The ceiling is the inner covering made.

He sayth I wil build me wide house, and large chambers: so he will make himselfe large windowes, and *sieling* with cedars, and paint them with vermillion. *Breeches' Bible. Jer.* xxii. 14.

Is it time for yourselves to dwell in your *sieled* houses, and this house lie waste. [Shewing that they sought not only their own necessities but their very pleasures before God's honour. Note].
Id. Hag. i. 4.

And he built the walls of the house within with boards of cedar, both the floor of the house, and the walls of the *ceiling*. 1 *Kings* vi. 15.

And now the thickened sky,
Like a dark *ceiling* stood, down rushed the rain
Impetuous. *Milton's Paradise Lost.*

Varnish makes *ceilings* not only shine, but last.
Bacon.

How will he, from his house *ceiled* with cedar, be content with his Saviour's lot, not to have where to lay his head? *Decay of Piety.*

So when the sun by day, or moon by night,
Strike on the polished brass their trembling light,
The glittering species here and there divide,
And cast their dubious beams from side to side:
Now on the walls, now on the pavement play,
And to the *ceiling* flash the glaring day. *Dryden.*

A rude hand may build walls, form roofs, and lay floors, and provide all that warmth and security require, we only call the nicer artificers to carve the cornice, or to paint the *ceilings*. *Johnson's Idler.*

Ceiling, in architecture, the top or roof of a lower room, or a covering of plaster over laths nailed on the bottom of the joists that bear the floor of the upper room; or, where there is no upper room, on joists for the purpose; hence called ceiling joists. Plastered ceilings are almost universal in Britain, more so than in any other country.

CEIMELIA; from κειμαι, to be laid up; in antiquity, precious pieces of furniture or ornaments, reserved for extraordinary occasions and uses. Sacred garments, vessels, &c. are reputed of the ceimelia of a church. Medals, antique stones, figures, MSS. records, &c. are the ceimelia of men of letters.

CELÆNÆ, in ancient geography, the capital of Phrygia Magna, situated on a mountain, at the common sources of the Meander and Marsyas. The king of Persia had a strong palace beneath the citadel, by the springs of the Marsyas, which rose in the market place, and flowed through the city. Cyrus the younger had also a palace there, but by the springs of the Meander which river passed likewise through the city. He had also an extensive park, full of wild beasts, and watered by the Meander, which ran through the middle. Xerxes is said to have built these palaces and the citadel after his return from Greece. Antiochus Soter removed the inhabitants of Celænæ into a city named, from his mother, Apamea; which became afterwards a mart inferior only to Ephesus.

CELANDINE, in botany. See Chelidonium.

Celandine, Lesser. See Ranunculus.

form the inner covering of a room or building, or to ornament it. ‘A ceiled house,’ laqueata Vulg. in the Bible, Haggai i. 4, clearly means a superior and respectable house. The ceiling is the inner covering made.

> He sayth I wil build me wide house, and large chambers: so he will make himselfe large windows and *sieling* with cedars, and paint them with vermilion. *Breeches' Bible. Jer.* xxii. 14.

> Is it time for yourselves to dwell in your sieled houses, and this house lie waste. [Shewing that they sought not only their own necessities but their very pleasures before God's honour. Note]. *Id. Hag.* i. 4.

Celandine Tree. See Bocconia.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor a universal affirmative: e. g.

cE None whose understanding is limited can be omniscient.
LA Every man's understanding is limited,
RENT Therefore no man is omniscient.

CELASTRUS, in botany, the staff tree, a genus of the monogynia order and pentandria class of plants, natural order forty-third, dumosæ: cor. pentapetalous and patent: caps. quinquangular and trilocular: seed, veiled. There are thirty known species, two of which are inured to our climate: viz. 1. C. bullatus, an uncertain deciduous shrub, a native of Virginia, about four feet high, rising from the ground with several stalks, which divide into many branches, and are covered with a brownish bark. 2. C. scandens, or bastard euonymus, with woody, twining stalks, rising by the help of neighbouring trees to twelve feet. In Senegal the negroes use the powder of the root as a specific against gonorrhœas, which it is said to cure in eight, or sometimes in three days. An infusion of the bark of a species of staff tree, which grows in the Isle of France, is said to possess the same virtues.

CELEBES, or Macassar. See Macassar.

CEL'EBRATE, *v.*
Celebra'tion, *n.*
Cele'brious,
Celeb'rity.
} Lat. *celebro*, Fr. *celebrer*, Ital. *celebrare*. To speak of; to praise; to commend; to make famous. That is celebrated which is much spoken of, or distinguished by solemn rites.

> Besides the times which God himself in the law of Moses particularly specified, there were, through the wisdom of the church, certain others devised by occasion of like occurrence to those whereupon the former had arisen; as namely that which Mordecai and Esther did first *celebrate* in memory of the Lord's most wonderful protection, when Haman had laid his inevitable plot, to man's thinking, for the utter extirpation of the Jews, even in one day. *Hooker.*

> The law of God, which appointed them days of solemnity, taught them likewise in what manner the same should be *celebrated*. *Id.*

> He shall conceal it,
> While you are willing it shall come to note;
> What time we will our *celebration* keep,
> According to my birth. *Shakspeare.*

> For (as that worthy man St. Ambrose saith) he is unworthy of the Lord, that otherwise doth *celebrate* that mystery, than it was delivered by him. *Homilies of the Church.*

> On the feast day, the father cometh forth, after divine service, into a large room, where the feast is *celebrated*. *Bacon.*

> The manner of her receiving, and the *celebrity* of the marriage, were performed with great magnificence. *Id.*

> For the grave cannot praise thee; death cannot *celebrate* thee; they that go down into the pit cannot hope for thy truth. *Isaiah* xxxviii. 18.

> This boldness, together with my eminent ignorance, makes him admire the scarcity of learned men in our country, that could find no better Doctors to send to Dort-Conference than Master Hall. To your grief, Sir, it was a synod; and that noble and *celebrious*. *Bishop Hall.*

> It is evident by this, that the custom of the church was not only in *celebration* of the holy communion, but in all her other offices to say this prayer, not only for Christ's Catholic church, but for all the world. *Bishop Taylor.*

> No more shall be added in this place, his memory deserving a particular *celebration*, than that his learning, piety, and virtue, have been attained by few. *Clarendon.*

> By not joining at stated times in *celebration* of divine worship, we may be well conceived wholly to disclaim God, or greatly to disesteem him. *Barrow's Sermons.*

> The Jews, Jerusalem, and the temple, having been always so *celebrious*; yet when, after their captivities, they were despoiled of their glory, even then Assyrians, Greeks, and Romans, honoured with sacrifices the Most High God, whom that nation worshipped. *Grew.*

> This pause of power 'tis Ireland's hour to mourn;
> While England *celebrates* your safe return. *Dryden.*

> The songs of Sion were psalms and pieces of poetry, that adored or *celebrated* the Supreme Being. *Addison.*

> I would have him read over the *celebrated* works of antiquity, which have stood the test of so many different ages. *Id.*

> It has lately been a *celebrated* question in the schools of philosophy, ‘whether the soul always thinks.’ *Johnson's Idler.*

CELERES; from celer, quick; in Roman antiquity, a regiment of body guards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curiæ of the people, each of which furnished ten. The celeres always attended near the king's person, to guard him and to execute his orders. In war they made the van-guard in the engagement, which they always began first; in retreats they made the rear guard. Though they were a body of horse, yet they usually dismounted and fought on foot; their commander was called tribune, or prefect of the celeres. They were divided into three troops of 100 each, commanded by a centurion; their tribune was the second person in the kingdom. Brutus, who overturned the monarchy, was tribune of the celeres.

CELERIACK, in botany, a variety of the apium. See Apium.

CELE'RITY, *n.* קלה, κελλω, to run swiftly. Hence the the Latin celero, to hasten; and celerity, accelerate, acceleration, Eng. speed, swiftness, quickness.

> Forasmuch as that motion is circular whereby we make our divisions of time, and the compass of that circuit such that the heavens, which are therein continually moved and keep in their motions *celerity*, must needs touch often the same points, they cannot choose but bring unto us by equal distances frequent returns of the same times. *Hooker.*

> Cleo. *Celerity* is never more admired
> Than by the negligent.
> Ant. A good rebuke
> Which might have well becomed the best of men
> To taunt at slackness.
> *Shakspeare. Ant. and Cleop.*

> Hence hath offence its quick *celerity*,
> When it is borne in high authority.
> *Id. Measure for Measure*

In desire *celerity* itself is delay. *Bacon.*

Three things concur to make a percussion great; the bigness, the density, and the *celerity* of the body moved. *Digby.*

Whatever encreaseth the density of the blood, even without encreasing its *celerity*, heats, because a denser body is hotter than a rarer.

Arbuthnot on Aliments.

I wondered by what malignant power my peace was blasted, till I discovered at last that I had nothing to do. Time, with all its *celerity*, moves slowly to him whose whole employment is to watch its flight. I am forced upon a thousand shifts to enable me to endure the tediousness of a day.

Johnson.

CELERITY, in mechanics, the swiftness of any body in motion. It is also defined to be an affection of motion, by which any moveable body runs through a given space in a given time.

CELERY, in botany, the English name of a variety of the apium graveolens. See APIUM.

CELE'STIFY, *v.* } Gr. *κοιλον*, *cavern*, hollow; whence *cælum*, *celestes*, Lat. heavens, heavenly. Celestify is to make heavenly; celestial, that which is heavenly, or tending toward heaven, excellent, superior.
CELE'STIAL, *n.*
CELE'STICAL, *adj.*

We should affirm, that all things were in all things, that heaven were but earth terrestrified, and earth but heaven *celestified*, or that each part above had influence upon its affinity below. *Browne's Vulgar Errours.*

There stay until the twelve *celestial* signs
Have brought about their annual reckoning.
Shakspeare.

Play that sad note
I named my knell, whilst I sit meditating
On that *celestial* harmony I go to. *Id.*

You have heard with what constant faith, we should clothe and deck ourselves, that we might be fit and decent partakers of that *celestial* food.

Homilies of the Church.

There are also *celestial* bodies, and bodies terrestrial: but the glory of the *celestial* is one, and the glory of the terrestrial is another. 1 *Cor.* xv. 40.

HOST. Peace, I say; hear mine host of the garter. Am I politic? Am I subtle? Am I a machiavel? Shall I lose my doctor? No; he gives me the potions and the motions. Shall I lose my parson? my priest? my Sir Hugh? No; he gives me the proverbs, and the noverbs. Give me thy hand terrestrial, so: Give me thy hand, *celestial*; so.

Shakspeare's Merry Wives.

If onions and garlic had grown as ripely in tha wilderness, and manna had rained down no where but in Egypt, how would ye have hated those rude and strong sallads, and have run mad for these *celestial* delicates. *Bishop. Hall.*

My warbling lute, the lute I whilom strung,
When to king John of Portugal I sang,
Was but the prelude of that glorious day,
When thou on silver Thames didst cut thy way,
With well-timed oars before the royal barge,
Swelled with the pride of thy *celestial* charge. *Dryden.*

Thus affable and mild the prince precedes,
And to the dome the unknown *celestial* leads. *Pope.*

Celestial powers thy servants are,
Then what can earth to thee compare. *Watts.*

Celestial maid, receive this prayer!
If e'er thy beam divine
Should gild the brow of toiling care,
And bless a hut like mine. *Carter.*

And didst thou not, thy breast to his replying,
Blend a *celestial* with a human heart,
And love, which dies as it was born in sighing,
Share with immortal transports? *Byron.*

CELESTIN, the name of five popes of Rome: of whom the most remarkable was,

CELESTIN V. whose original name was Peter de Meuron. He was born at Ifernia, in Naples, in 1215, of mean parents. He retired, while very young, to a solitary mountain, to dedicate himself to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom, charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community in 1254; which was approved by pope Urban IV. in 1264, and erected into a distinct order, called the hermits of St. Damien. Peter governed this order till 1286, when his love of solitude and retirement induced him to quit the charge. In July, 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of Celestins from him. By his bull he approved their constitution, and confirmed all their monasteries, to the number of twenty. But he sat too short a time in the chair of St. Peter to do much for his order; for having governed the church five months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a consistory held at Naples; and died in 1269.

CELESTINS, a religious order so called from their founder pope Celestin V. After his death his order made great progress in Italy and France; whither the then general Peter of Tivoli sent twelve religious, at the request of Philip the Fair, who gave them two monasteries; one in the forest of Orleans, and the other in that of Compiegne. This order likewise passed into several provinces of Germany. They had about ninety-six convents in Italy, and twenty-one in France, under the title of priories, before the revolution. The Celestins rise two hours after midnight, to say matins. They eat no flesh except when sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from the feast to Easter, every day. Their habit consists of a white gown, a capuche, and a black scapulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELEUMA, or CELEUSMA, from κελευειν, to call; in antiquity, 1. The shout or cry of the seamen, whereby they animated each other in their work of rowing. 2. A kind of song or formula, rehearsed or played by the master or others, to direct the strokes and movement of the mariners, as well as to encourage them to labor.

CELEUSTES, in ancient navigation, the boatswain or officer appointed to give the rowers the signal, when they were to pull, and when to stop.

CE'LIACK, *adj.* Κοιλια, the belly. Relating to the lower belly.

The blood moving slowly through the *celiack* and mesenterick arteries, produces complaints.

he ancient Romans very wisely
maginable to discourage celibacy.
ore usual than for the censors to
on bachelors. Dionysius Hali-
mentions an ancient constitution
persons of full age were obliged to
first law of that kind, of which we
certainty, is that under Augustus,
Julia de maritandis ordinibus. It
ards denominated Papin, Poppæa, and
ally Julia Papia, in regard of some
nts made to it under the consuls Papius
pæus. By this law, divers prerogatives
ven to persons who had many children;
s imposed on those who lived a single
that they should be incapable of receiving
s, and not exceeding a certain proportion.
LIBATE is a term chiefly used in speaking
e single life of the popish clergy, or the ob-
tion they are under to abstain from marriage.
this sense we say the law of celibate. Monks
d religious take a vow of celibate; and, what
sometimes very distinct, of chastity. The

church of Rome imposes a universal celibacy on its clergy, from the pope to the lowest subdeacon. The advocates for this usage pretend, that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. It is generally agreed, however, that most of the apostles were married: some say all of them, except St Paul and St. John. Be this as it may, in the next age after the apostles, we have accounts of many married bishops, presbyters, and deacons. Novatus was a married presbyter of Carthage, as we learn from Cyprian; who himself was also a married man; and so was Cæcilius the presbyter who converted him; and Numidius, another presbyter of Carthage. The Romanists reply to this, that all married persons, when ordained, promised to live separate from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. There seems early indeed to have been a tendency towards the introduction of such a law, by one or two zealots; but the motion was no sooner made than it was quashed by the authority of wise men. Thus Eusebius observes, that Pinytus, bishop of Gnossus in Crete, was for imposing the law of celibacy upon his brethren; but Dionysius, bishop of Corinth, wrote to him, that he should consider the weakness of men. In the council of Nice, A. D. 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, whom they had married before ordination; but Paphnutius, a famous Egyptian bishop, and one who himself was never married, vigorously declaimed against it, upon which it was unanimously rejected. The council in Trullo, held in 692, made a difference in this respect between bishops and presbyters; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination; and giving the Romish church a rebuke for the prohibition: but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a celibate established in the Greek church, but only as to bishops. In the Latin church, the like establishment was also made, but by slow steps in many places. For in Africa, even bishops cohabited with their wives at the time of the council of Trullo.

CELL, *n.*
CE'LLAR,
CE'LLARAGE,
CE'LLULAR, *ad.*
} כלא, *confinement*; whence celo; Lat. *to hide*. A cave or hollow place where things are hidden or concealed: hence a place of retirement or seclusion; and a cellar or storehouse under the ground.

The lyf is more than mete, and the body more than clothing. Behold the crowis: for thei sowen not, neither repen, to which is no *celer*, no berne, and God fedith them, how myche more ye ben of more prys than thei? *Wiclif's New Test. Luke*, xii

Besides, she did intend confession,
At Patrick's *cell* this even; and there she was not
Shakspeare.

HAM. Ha, ha, boy! sayest thou so? art thou there, come on, true-penny?—you hear this fellow in the *cellerage*—consent to swear. *Id. Hamlet*

Mine eyes he closed, but open left the *cell*
Of fancy, my internal sight. *Milton. Par. Lost.*

Then did religion in a lazy *cell*,
In empty, airy contemplations dwell. *Denham.*

The brain contains ten thousand *cells*,
In each some active fancy dwells. *Prior.*

In cottages and lowly cells
True piety neglected dwells;
Till called to heaven, its native seat,
Where the good man alone is great.
Somerville.

How bees for ever, though a monarch reign,
Their separate *cells* and properties maintain. *Pope.*

Let these, by thy inflictions won
The example of his deeds to shun,
(While as from morn to eve they roam,
Some ruined *cell* their casual home,
Each night affords), by hunger led,
Seek at the rich man's gate their bread.
Merrick.

How soft the music of those village bells,
Falling at intervals upon the ear
In cadence sweet, now dying all away,
Now pealing loud again, and louder still,
Clear and sonorous as the gale comes on!
With easy force it opens all the *cells*
Where memory slept. *Cowper.*

Adieu, thou dreary pile, where never dies
The sullen echo of repentant sighs!
Ye sister mourners of each lonely *cell*
Inured to hymns and sorrow, fare ye well!
For happier scenes I fly this darksome grove;
To saints a prison, but a tomb to love. *Sheridan.*

This cave was surely shaped out for the greeting
Of an enamoured goddess, and the *cell*
Haunted by holy love—the earliest oracle! *Byron.*

The urine, insinuating itself amongst the neighbouring muscles, and *cellular* membranes, destroyed four. *Sharp's Surgery.*

The interstices of the *cellular* substance are lubricated and moistened by a serous or watery fluid, poured out from the exhalent arteries, and again taken in by the absorbents. It thus acquires a pliancy and softness, which adapt it particularly to serve as a connecting medium for parts, which have motion on each other. The importance of this property will be best understood by observing the effects of its loss. *Dr. A. Rees.*

Cell is also used for a lesser or subordinate sort of monastery dependent on a great one, by which it was erected, and continues to be governed. The great abbeys in England had most of them cells in places distant from the mother abbey, to which they were accountable, and from which they received their superiors. The alien priories in England were cells to abbeys in Normandy, France, Italy, &c. The name was also given to rich monasteries, not dependent on any other. It signifies also a little apartment, wherein the ancient monks, solitaries, and hermits, lived in retirement. The name is still retained in various monasteries. The dormitory is frequently divided into cells or lodges. The Carthusians have each a separate cell. The hall wherein the Roman conclave is held, is divided, by partitions, into cells, for the cardinals to lodge in.

Cellar differs from vault, as the latter is supposed to be deeper, the former being frequently little below the surface of the ground. Cellars, in modern buildings, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built; or they are situated under the pavement before the house, especially in streets and squares.

CELLARER, or Cellerer, Cellerarius, or Cellarius, an officer in monasteries, to whom belong the care and procurement of provisions for the convent. The cellerarius was one of the four obedientiarii, or great officers of monasteries: under his ordering was the pistrinum or bakehouse, and the bracinum, or brew-house. In the richer houses there were particular lands set apart for the maintenance of his office, called in ancient writings ad cibum monachorum. His whole office in ancient times had a respect to that origin: he was to see his lord's corn got in, and laid up in granaries; and his appointment consisted in a certain proportion thereof, usually fixed at a thirteenth part of the whole, together with a furred gown. The office of cellarer then only differed in name from those of bailiff and minstrel; excepting that the cellarer had the receipt of his lord's rents through the whole extent of his jurisdiction. The cellarer was also an officer in chapters, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money, to canons for their attendance in the choir. In some places he was called burser.

CELLARIUM, in antiquity, an allowance of provisions furnished out of the cella, to the governor of the province and his officers, &c. Cellarium differed from penus, as the former was only a store-house for several days, the latter for a long time. Thus the Bactroperatæ are said by St. Jerome to carry cellar about with them.

CELLARIUS (Christopher), was born in 1638, at Smalcalde, in Franconia, where his father was minister. He was successively rector of the colleges at Weymar, Zeits, and Mersebourg; and the king of Prussia having founded an university at Hall, in 1693, he was prevailed on to be professor of eloquence and history there, where he composed the greatest part of his works. His great application to study hastened the infirmities of old age. His works relate to grammar, geography, history, and the oriental languages, and the number of them is amazing. He died in 1707.

CELLEPORÆ, a genus of marine plants, or rather animals; a class of worms in the Linnæan system. They are of the genus of the lythophyta. See Coral.

CELLINI (Benvenuto), an eminent statuary, contemporary with Michael Angelo, and Julio Romano, and was employed by popes, kings, and other patrons of arts and sciences. Some of his productions are much esteemed. He lived to a very considerable old age; and his life, almost to the last, was a continued scene of alternate adventure, patronage, persecution, and misfortune. He wrote his own history, which was not, however, published till 1730, probably on account of the freedom with which he therein treated many distinguished personages of Italy and other countries. It was translated into English by Dr. Nugent, in 1771, to which the reader is referred, as it will not admit of a proper abridgment. He also wrote treatises on goldsmiths' work and on casting statues.

Cellular Interstices, or Cellular Membrane. See Anatomy.

CELOSIA, cocks-comb: a genus of the monogynia order, pentandria class of plants; natural order fifty-fourth, miscellaneæ: cal. triphyllous: cor. five-petalled in appearance: stam. conjoined at the base to the plaited nectarium: caps. gaping horizontally. There are eighteen species, of which the most worthy of notice is the C. cristata, or common cocks-comb, so called on account of its crested head of flowers, resembling a cock's comb; of which there are many varieties. The principal colors of their flowers are red, purple, yellow, and white; but there are some whose heads are variegated with two or three colors. The heads are sometimes divided like a plume of feathers, and are of a beautiful scarlet color. These plants are very tender exotics, and require a great deal of care to cultivate them in this country.

CELSIA, in botany: a genus of the angiospermia order, and tridynamia class of plants; natural order twenty-eighth, luridæ: cal. quinquepartite: cor. wheel-shaped; the filaments bearded or woolly: caps. bilocular. Species, five; two being natives of Candia and the East Indies, two of Armenia, and one of the plains of Algiers.

CE'LSITUDE, *n. s.* Lat. *celsitudo.* Height.

CELSUS (Aurelius Cornelius). It is commonly supposed, that this esteemed ancient author was a Roman, of the Cornelian family, born towards the end of the reign of Augustus, and still living in the time of Caligula. But these points are not established upon certain testimony, and it is even disputed whether he practised medicine; though his perfect acquaintance with the doctrines of his predecessors, his accurate descriptions of diseases, and his judicious rules of treatment, appear to leave little room for doubt on that head. At any rate, his eight books, De Medicina, have gained him deserved celebrity in modern times, containing a large fund of valuable information; detailed in remarkably elegant and concise language. In surgery particularly he has been greatly admired, for the methods of practice laid down, and for describing several operations as they are still performed. He was the Hippocrates of the Latins, and, without him, the writings of that father in physic would be often unintelligible, and often misunderstood by us. He shows us also how the ancients cured distempers by friction, bathing, &c. The Elzevir edition of Celsus, in 1650, by Vander Linden, is the best, being entirely corrected from his MSS.

Celsus, an Epicurean philosopher, in the second century. He wrote a work against the Christians, entitled, The True Discourse; to which Origen, at the desire of Ambrose his friend, wrote a learned answer. To this philosopher Lucian dedicated his Pseudomanies.

CELTÆ, or Celtes, an ancient nation, by which most of the countries of Europe are thought to have been peopled. The general opinion is that they are descended from Gomer, the eldest son of Japhet: that Gomer settled in Phrygia; his sons Ashkenaz and Togarmah in Armenia, and Riphath in Cappadocia: that the Celtæ, took the left hand, spreading westward towards Poland, Hungary, Germany, France, and Spain; while the descendants of Magog, Gomer's brother, moving eastward, peopled Tartary. In this large European tract, the Celtes began to appear a powerful nation under several considerable kingdoms. Mention is made of them indeed in so many parts of Europe, by ancient geographers and historians, that Ortelius took Celtica to be a general name for the continent of Europe, and made a map of it bearing this title. In those parts of Asia which they possessed, as well as in the different parts of Europe, the Celtes went by various names. In Lesser Asia they were known by the names of Titans and Sacks; in the northern parts of Europe by those of Cimmerians, Cimbrians, &c. and in the southern parts they were called Celtes, Gauls, or Galatians. As to the government of the Celtes, all we know is, that the curetes, and afterwards druids and bards, were the interpreters of their laws; judged all causes criminal and civil; and their sentence was reckoned so sacred, that whoever refused to abide by it was excluded from assisting at their sacred rites; after which no man dared to converse with him; so that this punishment was reckoned even severer than death itself. They neither reared temples nor statues to the Deity, but destroyed them wherever they could find them, planting in their stead large spacious groves; which, being open on the top and sides, were, in their opinion, more acceptable to the divine Being, who is absolutely unconfined. The Celtes accounted the oak the emblem of the Deity, and preferred that tree above all others to plant their groves with, attributing several supernatural virtues both to its wood, leaves, fruit, and misletoe; all which were made use of in their sacrifices and other parts of their worship. But after they had adopted the idolatrous superstition of the Romans and other nations, and the apotheosis of their heroes and princes, they came to worship them much in the same manner: as Jupiter under the name of Taran, which in the Celtic signifies thunder; Mercury, whom some authors call Heus, or Hesus, probably from the Celtic huadh, which signifies a dog, and might be the Anubis latrans of the Egyptians. But Mars was held in the greatest veneration by the warlike, and Mercury by the trading part of the nation. The care of religion was immediately under their curetes, druids, and bards. See Bards, Druids, and Gaul.

Celtes, certain ancient instruments of a wedge-like form, of which several have been discovered in different parts of Great Britain. Antiquarians have generally attributed them to the Celtæ; but, not agreeing as to their use, distinguished them by the above appellation. Whitaker makes it probable that they were British battle-axes. See Battle-axe.

CELTIBERI, or Celtiberians (i. e. the Celtæ seated on the Iberus), the inhabitants of Celtiberia. They were very brave and warlike, their cavalry in particular was excellent. They wore a black rough cloak, the shag of which was like goats' hair. Some of them had light bucklers like the Gauls; others, hollow and round ones like those of other nations. They all wore boots made of hair, and iron helmets adorned with crests of a purple color. They used swords which cut on both sides, and poniards of a foot long. Their arms were of an admirable temper, and are said to have been prepared in the following manner: they buried plates of iron under ground, where they let them remain till the rust had eaten the weakest part of the metal, and the rest was consequently hard and firm. Of this excellent iron they made their swords, which were so strong and well tempered, that there was neither buckler nor helmet that could resist their edge. The Celtiberians were very cruel towards their enemies and malefactors, but showed the greatest humanity to their guests. They not only cheerfully granted their hospitality to strangers who travelled in their country, but were desirous that they should seek protection under their roof.

CELTIBERIA, in ancient geography, a territory south-west of Spain, along the side of the river Iberus. Sometimes the greatest part of Spain was called by this name.

CELTIS, in botany, the lote, or nettle-tree; a genus of the monœcia order, and polygamia class of plants; natural order fifty-third, scabridæ. It is a hermaphrodite plant: female CAL. quinquepartite: COR. none: there are five stamina, and two styles: FRUIT a monospermous plum. Male CAL. hexapetalous: COR. none: there are six stamina, and an embryo of a pistillum. There are twelve known species, all of them deciduous. The principal are: 1. C. occidentalis, the western celtis, a native of Virginia, growing with large, fair, straight stems; the branches are numerous and diffuse; the bark is of a darkish gray color; the leaves are of a pleasant green, three or four inches long, deeply serrated, and in a narrow point, nearly resemble the leaves of the common stinging nettle, and continue on the trees till late in the autumn. 'The wood of the lote tree is extremely durable. In Italy they make their flutes, pipes, and other wind instruments of it. With us the coach-makers use it for the frames of their vehicles.' 2. C. orientalis, the eastern celtis, a native of Armenia. It grows to about twelve feet; and the branches are numerous, smooth, and of a greenish color. The leaves are smaller than those of the others, though they are of a thicker texture, and a lighter green. The flowers come out from the wings of the leaves, on slender foot-stalks: they are yellowish, appear early in spring, and are succeeded by large yellow fruit.

CE'MENT, *v. a.*
CEME'NT, *n.*
CEME'NTER, *n.*
} Lat. *cæmentum*, from *cædo*, to break by beating; because ancient cements were made of small, broken stones: to join, or make to cohere; to come into union or cohesion; anything that binds or unites.

> MEN. What's the news?—
> COM. Your temples burned in their *cement*; and
> Your franchises, whereon you stood, confined
> Into an augur's bore. *Shaks. Coriolanus.*

> But how the fear of us
> May *cement* their divisions, and bind up
> The petty difference, we yet not know. *Id.*

There is a *cement* compounded of flour, whites of eggs, and stones powdered, that becometh hard as marble.—You may see divers pebbles, and a crust of *cement* or stone between them, as hard as the pebbles themselves. *Bacon.*

Look over the whole creation, and you shall see, that the band or *cement*, that holds together all the parts of this great and glorious fabrick, is gratitude. *South.*

It is very observable that Arrianus, saith L. VII., the temple of Belus, in the midst of the city of Babylon, of a vast bigness, was made of bricks *cemented* with asphaltus. *Whitby's Commentary, Gen. xi. 3.*

Madam, religion is the foundation and *cement* of
human societies: and when they that serve at God's
altar shall be exposed to poverty, then religion itself
will be confined to them.
Hooker's Speech to Q. Elizabeth.

God having designed man for a sociable creature,
furnished him with language, which was to be the
great instrument and *cementer* of society. *Locke*

Liquid bodies have nothing to *cement* them; they
are all loose and incoherent, and in a perpetual flux
even an heap of sand or fine powder, will suffer n
hollowness within them, though they be dry substan
ces. *Burnet's Theory of the Earth*

> Love with white lead *cements* his wings;
> White lead was sent us to repair
> Two brightest, brittlest, earthly things,
> A lady's face, and china ware. *Swif*

The foundation was made of rough stone, joine
together with a most firm *cement*; upon this was la

When a wound is recent, and the parts of it a
divided by a sharp instrument, they will, if held
close contact for some time, reunite by inosculatio
and *cement* like one branch of a tree ingrafted
another. *Sharp's Surge*

These walls were drawn round the city in the fo
of an exact square, each side of which was 120 f
longs, or fifteen miles in length, and all built of la
bricks, *cemented* together with bitumen, a glutin
slime arising out of the earth in that country, wh
binds in building much stronger and firmer than li
and soon grows much harder than the brick or sto
themselves which it *cements* together.
Prideaux's Connect

> On the side altar *censed* with sacred smoke,
> And bright with flaming fires. *Dry*

The foundation was made of rough stones, joi
together with a most firm *cement*; upon this was
another layer, consisting of small stones and *ceme*
Arbuthnot on C

An advantageous peace was at last conclu
where he had given the law. The allies were so
raged against each other, that they were not likel
cement soon in any new confederacy. *H*

CEMENT comprehends mortar, solder, p
&c.; but has been sometimes restrained to c
positions used for holding together broken gla
china, and earthenware. For this purpose
juice of garlic is recommended as exceedi
proper, being both very strong, and, if the op
tion is performed with care, leaving little o
mark. Quicklime and the white of an
mixed together, and expeditiously used, are
very proper for this purpose. Dr. Lewis re
mends a mixture of quicklime and cheese, i
following manner:—'Sweet cheese shaved

, changes into
not mingle with
quantities of hot
. hot stone with a
me, into the con-
strong and durable
henware, and glass.
it will be in two or
least acted upon by
n with quick lime, as
mists for luting cracked
acious.' A composition
seed and white lead is
. purposes, but is greatly

g, is used to denote any
tronger kind than ordinary.
ly used is of two kinds; hot,
t cement is made of resin,
st, and chalk, boiled together.
mented are heated, and rubbed
r, with cement between them.
t is that above described for ce-
&c., which is sometimes, though
d in building. The ruins of the
n buildings are found to cohere so
most people have imagined the
e acquainted with some kind of
ch, in comparison of ours, might
lled cement; and that to our want of
. of the materials they used, is owing
inferiority of modern buildings in their
y. Dr. Anderson, in his Essays on
ture, has discussed this subject at con-
le length, and seemingly with great judg-
He is the only person who has given
onal theory of the uses of lime in building,
why it comes to be the proper basis of all
ents. It is in substance as follows: Lime
ich has been slacked and mixed with sand,
ecomes hard and consistent when dry, by a
process similar to that which produces the natu-
ral stalactites in caverns. These are always
formed by water dropping from the roof. By some unknown and inexplicable process of nature, this water has dissolved in it a small portion of calcareous matter in a caustic state. As long as the water continues covered from the air, it keeps the earth dissolved in it; it being the natural property of calcareous earths, when deprived of their fixed air, to dissolve in water. But when the small drop of water comes to be exposed to the air, the calcareous matter contained in it begins to attract the fixable part of the atmosphere. In proportion as it does so, it also begins to separate from the water, and to resume its native form, the limestone of marble. This process Dr. Anderson calls a crystallisation; and when the calcareous matter is perfectly crystallised in this manner, he affirms that it is to all intents and purposes limestone or marble of the same consistence as before: and 'in this manner,' says he, 'within the memory of man, have huge rocks of marble been formed near Matlock in Derbyshire.' If lime in a caustic state is mixed with water, part of the lime will be dissolved, and will also begin to crystallise. The water which parted with the crystallised lime, will then begin to act upon the remainder, which it could not dissolve before; and thus the process will continue, either till the lime be all reduced to an effete, or crystalline state, or something hinders the action of the water upon it. It is this crystallisation which is observed by the workmen when a heap of lime is mixed with water, and left for some time to macerate. A hard crust is formed upon the surface, which is ignorantly called frosting, though it takes place in summer as well as in winter. If therefore the hardness of the lime, or its becoming a cement, depends entirely on the formation of its crystals, it is evident that the perfection of the cement must depend on the perfection of the crystals, and the hardness of the matters which are entangled among them. The additional substances used in making of mortar, such as sand, brick-dust, or the like, according to Dr. Anderson, serve only for a purpose similar to what is answered by sticks put into a vessel full of any saline solution, namely, to afford the crystals an opportunity of fastening themselves upon it. If therefore the matter interposed between the crystals of the lime is of a friable, brittle nature, such as brick-dust or chalk, the mortar will be of a weak and imperfect kind; but when the particles are hard, angular, and very difficult to be broken, such as those of river or pit-sand, the mortar turns out exceedingly good and strong. Sea-sand is found to be an improper material for mortar, which Dr. Anderson ascribes to its being less angular than the other kinds. That the crystallisation may be more perfect, he also recommends a large quantity of water, that the ingredients be perfectly mixed together, and that the drying be as slow as possible. An attention to these circumstances, he thinks, would make the buildings of the moderns equally durable with those of the ancients; and from what remains of the ancient Roman works, he thinks a very strong proof of his hypothesis might be adduced. The great thickness of their walls necessarily required a vast length of time to dry. The middle of them was composed of pebbles thrown in at random, and which have evidently had mortar so thin as to be poured in among them. Thus a great quantity of lime would be dissolved, and the crystallisation performed in the most perfect manner; and the indefatigable pains and perseverance for which the Romans were so remarkable in all their undertakings, leaving no room to doubt that they would take care to have the ingredients mixed together as well as possible. The consequence of all this is, that the buildings formed in this manner are all as firm as if cut out of a solid rock; the mortar being equally hard, if not more so, than the stones themselves. Nowithstanding the bad success of those who have attempted to repeat M. Loriot's experiments, however, Dr. Black informs us that a cement of this kind is certainly practicable. It is done, he says, by powdering the lime while hot from the kiln, and throwing it into a thin paste of sand and water; which not slaking immediately, absorbs the water from the mortar by degrees, and forms a very hard mass. 'It is plain,' he adds, 'that the strength of this mortar depends on using the lime hot or fresh from the kiln.' By mixing together gypsum and quick lime, and then adding water, we may form a ce-

hasta or spear was taken from him, and consequently his wages and hopes of preferment stopped.

CE'NSOR, *n.*
CENSO'RIAL.
CENSO'RIAN.
CENSO'RIOUS.
CENSO'RIOUSNESS.
CE'NSORSHIP.

Lat. *censor*; 'He who executed the census at Rome, and was empowered, as a magistrate, to censure and punish evil generally, even to the degrading the senators, &c. See the extract from Lempriere. Hence applied to a critic, or any severe judge of others; to the disposition to judge harshly; and the office of determining authoritatively what may or may not be printed. As, after a thirty years' struggle for liberty, we have a modern censorship of the press in France. Sometimes it has *of* before the object of reproach, and sometimes *on* or *upon*.

After the office of the *censors* had remained for some time unaltered, the Romans, jealous of their power, abridged the duration of their office, and a law was made A. U. C. 420, by Mamercus Æmilius, to limit the time of the *censorship* to eighteen months. Their office was more honorable, though less powerful, than that of the consuls; the badges of their office were the same, but the *censors* were not allowed to have lictors to walk before them as the consuls. When one of the *censors* died, no one was elected in his room till five years were expired, and his colleague immediately resigned. This circumstance originated from the death of a *censor* before the sacking of Rome by Brennus, and was ever after deemed an unfortunate event to the republic. The emperors abolished the *censors*, and took upon themselves to execute their office. *Lempriere's Class. Dict.*

It was brought to Rome in the *censorship* of Claudius. *Browne's Vulgar Errours.*

As the chancery had the pretorian power for equity, so the star-chamber had the *censorian* power for offences under the degree of capital. *Bacon.*

Troublesome, *censorious*, dividing, spirits occasioned more thoughts of those unhappy controversies about forms and ceremonies, church government, &c. and I was still more satisfied, even when most serious, that the bitter extremes of dissenters, as well as of rigid conformists, were highly displeasing to God.
French's Diary, 1677.

Ill-natured *censors* of the present age,
And fond of all the follies of the past.
Roscommon.

Do not too many believe no religion to be pure, but what is intemperately rigid; no zeal to be spiritual, but what is *censorious*, or vindictive? *Spratt.*

Sourness of disposition, and rudeness of behaviour, *censoriousness* and sinister interpretation of things, all cross and distasteful humours, render the conversation of men grievous and uneasy to one another.
Tillotson.

The most severe *censor* cannot but be pleased with the prodigality of his wit, though at the same time, he could have wished that the master of it had been a better manager. *Dryden.*

He treated all his inferiors of the clergy with a most sanctified pride; was rigorously and universally *censorious upon* all his brethren of the gown. *Swift.*

My God, if truth their *censure* guide,
If guilt be in my facts descried,
If e'er from my dissembling heart
My friend has found the hostile part

* * * *

Now in the dust my life be laid,
And earth's dark womb my glory shade.
Merrick.

A statesman, who is possessed of real merit, should look upon his political *censurers* with the same neglect that a good writer regards his critics. *Addison.*

You, my disciples, live in a very *censorious* age, and the scribes and pharisees, who are in the highest esteem for the strictness of their lives, place a great part of their own religion in condemning others; but see to it, that you do not judge those about you, in this rigorous and severe manner.
Doddridge's Expositor, Matt. vii.

Whatever references is due to his diligence, or his attainments, it can be no criminal degree of *censoriousness* to charge that etymologist with want of judgment, who can seriously derive dream from drama, because life is a drama, and drama is dream.
Johnson.

Those who raise envy will easily incur *censure*.
Id. Idler.

It commonly happens to him who endeavours to obtain distinction by ridicule or *censure*, that he teaches others to practise his own arts against himself.
Id.

I therefore dismiss it with frigid tranquillity, having little to fear or hope from *censure* or from praise.
Id.

I am sorry to find the *censure* I have passed upon Occiduus is even better founded than I supposed.
Cowper.

In youth, the seed-time of our days,
Full many a crop is spoiled by praise;
And all the spring-tide fields of Hope
Smiles that should ripen, wither up.
While *censure*, rigid and unkind,
Nips the young buds and starves the mind.
Smith's Album.

CENSORS, from censere, to see; two prime magistrates in ancient Rome. Their business was to register the effects of the Roman citizens, to impose taxes, and to take cognizance of the manners of the citizens. They had a power to censure immorality, by inflicting some mark of ignominy on the offender. They had even a power to create the princeps senatus, and to expel from the senate such as they deemed unworthy of that office. This power they sometimes exercised arbitrarily, and therefore a law was passed, that no senator should be degraded, until he had been formally accused and found guilty by both the censors. They also filled up the vacancies in the senate, upon any remarkable deficiency in their numbers; they let out to farm all the lands and revenues of the republic; and contracted with artificers, for building and repairing all the public works, both in Rome and the colonies of Italy. In all parts of their office, however, an appeal always lay from the sentence of the censors, to that of an assembly of the people. The first two censors were created A. U. C. 311, upon the senate observing that the consuls were so much taken up with war, as not to have time to look into other matters. The office continued till the time of the emperors, who assumed the censorial power, calling themselves morum præfecti; though Vespasian and his sons resumed the title of censors. Decius attempted to restore the dignity to a particular magistrate. After this we hear no more of the censors, till Constantine's time, who made his brother censor, and he seems to have been the last that enjoyed

A statesman, who is possessed of real merit, should ook upon his political *censurers* with the same respect hat a good writer regards his critics. *Addison.*

You, my disciples, live in a very *censorious* age, nd the scribes and pharisees, who are in the highest steem for the strictness of their lives, place a great art of their own religion in condemning others; but ee to it, that you do not judge those about you, in his rigorous and severe manner.
Doddridge's Expositor, Mat. vii.

Whatever references is due to his diligence, or his ttainments, it can be no criminal degree of *censoriousness* to charge that etymologist with want of udgment, who can seriously derive dream from rama, because life is a drama, and drama is dream.
Johnson.

Those who raise envy will easily incur *censure*.
Id. Idler.

It commonly happens to him who endeavours to btain distinction by ridicule or *censure*, that he eaches others to practise his own arts against himself.
Id.

I therefore dismiss it with frigid tranquillity, having ittle to fear or hope from *censure* or from praise.
Id.

I am sorry to find the *censure* I have passed upon eciduus is even better founded than I supposed.
Cowper.

Full many a crop is spoiled by praise;
And all the spring-tide fields of Hope
Smiles that should ripen, wither up.
While *censure*, rigid and unkind,
Nips the young buds and starves the mind.
Smith's Album.

Censors, from censere, to see; two prime magistrates in ancient Rome. Their business was to register the effects of the Roman citizens, to impose taxes, and to take cognizance of the manners of the citizens. They had a power to censure immorality, by inflicting some mark of ignominy on the offender. They had even a power to create the princeps senatus, and to expel from the senate such as they deemed unworthy of that office. This power they sometimes exercised arbitrarily, and therefore a law was passed, that no senator should be degraded, until he had been formally accused and found guilty by both the censors. They also filled up the vacancies in the senate, upon any remarkable deficiency in their numbers; they let out to farm all the lands and revenues of the republic; and contracted with artificers, for building and repairing all the public works, both in Rome and the colonies of Italy. In all parts of their office, however, an appeal always lay from the sentence of the censors, to that of an assembly of the people. The first two censors were created A. U. C. 311, upon the senate observing that the consuls were so much taken up with war, as not to have time to look into other matters. The office continued till the time of the emperors, who assumed the censorial power, calling themselves morum præfecti; though Vespasian and his sons resumed the title of censors. Decius attempted to restore the dignity to a particular magistrate, all this we hear no more of the censors, till ne's time, who made his brother censor, have been the last that enjoyed

the office. The office was so considerable, that for a long time none aspired to it till they had passed all the rest; so that it was thought surprising that Crassus should have been admitted censor, without having been either consul or prætor. At first the censors enjoyed their dignity for five years, but in A. U. C. 420, the dictator Mamertinus made a law restraining it to a year and an half, which was afterwards observed very strictly. At first one of the censors was elected out of a patrician, and the other out of a plebeian family; and, upon the death of either, the other was discharged from his office and two new ones elected, but not till the next lustrum. In 622 both censors were chosen from among the plebeians; and after that time the office was shared between the senate and people. After their election in the Comitia Centurialia, the censors proceeded to the capitol, where they took an oath to act equitably and impartially throughout the whole course of their administration. The late aristocratical government of Venice had a censor of the manners of the people, whose office lasted six months.

Ce'nsurable,
Ce'nsuring, *n.*
} Lat. *censura*, of the same etymology as censor. To give sentence judicially, or otherwise; to express an unfavorable opinion; a judicial sentence; an opinion of any kind. See the passages from Shakspeare; reprimand; blame; a condemnatory sentence or opinion.

Power of *censure* and ordination appeareth even by Scripture marvellous probable, to have been derived from Christ to his church, without this surmised equality in them to whom he hath committed the same.
Hooker.

Scripture hath said, 'For this very cause left I thee in Crete, that thou shouldst redress the things that remain; and shouldst ordain presbyters in every city, as I appointed thee.' In the former place the power of *censure* is spoken of, and the power of ordination in the latter.
Id.

Most honored madam,
My lord of York—out of his noble nature,
Zeal and obedience he still bore your grace;
Forgetting, like a good man, your late *censure*,
Both of his truth and him (which was too far),
Offers, as I do, in a sign of peace,
His service and his counsel.
Shakspeare. Henry VIII.

Glos. Madam, the king is old enough himself,
To give his *censure*; these are no women's matters.
Q. Mar. If he be old enough, what needs your grace
To be protector of his excellence?
Id. Henry VI.

Madam, and you, my sister, will you go
To give your *censures* in this weighty business?
Id. Richard III.

We must not stint
Our necessary actions with the fear
To cope malicious *censures*. *Id. Hen. VIII.*

They that can inflict *censures* upon presbyters, have certainly superiority of jurisdiction over presbyters, for æqualis æqualem coercere non potest, saith the law.
Jer. Taylor.

In St. Paul's time, though the *censure* of heresy were not so loose and forward as afterwards; and all that were called heretics were clearly such, and highly criminal; yet as their crime was, so was their *censure*, that is spiritual. *Taylor on Prophecy.*

But if I have answered every challenge, vindicated every authority; *censured* nothing unjustly; satisfied all his malicious objections, and warranted every sentence of my poor epistle; let my apology live and pass, and let my refuter go as he is. *Bishop Hall.*

What need we care for the *censures* of men, if our hearts can tell us that we are in favour with God. *Id.*

There is a deep corruption of mind and manners, which engageth men in their own defence to *censure* others, diverting the blame from home, and shrouding their own under the covert of other men's faults.
Barrow.

All mankind in a lump is severely *censured*, as void of any real goodness or true virtue; so fatally depraved as not to be corrigible by any good discipline; not to be recoverable even by the grace of God. Yea God himself is hardly spared, his providence coming under the bold obliquy of those, who, as the Psalmist speaketh of some in his time, whose race doth yet survive, speak loftily, and set their mouth against the heavens.
Id.

The like *censurings* and despisings have embittered the spirits, and whetted both the tongues and pens of learned men one against another. *Sanderson.*

It cannot reasonably be thought that Christ doth here forbid church governors to judge, condemn, and pass the *censures* of the church upon notorious and scandalous offenders, because he hath himself enjoined the execution of her *censures* upon those who will not hear the church when she requires them to repent of, and satisfy their Christian brothers for, any trespass done against him. *Whitby on Matt.* vii. 1.

CENSUS, in Roman antiquity, an authentic declaration made before the censors, by the people, of their respective names and places of abode. This was registered by the censors; and contained an enumeration, in writing, of all the estates, lands, and inheritances they possessed; their quantity, quality, place, wives, children, domestics, tenants, and slaves. In the provinces the census served not only to discover the substance of each person, but where, and in what manner and proportion, taxes might be best imposed. The census at Rome is commonly thought to have been held every five years: but Middleton has snown, that both census and lustrum were held at various irregular and uncertain intervals. The census was an excellent expedient for discovering the strength of the state; the number of the citizens, how many were fit for war, and how many for offices of other kinds, how much each was able to pay of taxes, &c. It went through all ranks of people, though under different names: that of the common people was called census; that of the knights, census, recensio, recognitio; that of the senators, lectio, relectio.—Hence it came to be used personally.

Census was also used for a person worth 100,000 sesterces, or who was entered as such in the censual tables, on his own declaration. In this sense, it amounts to the same with classicus, or a man of the first class; though Gellius limits the estate of such to 125,000 asses. By the Voconian law, no census was allowed to give by his will above a fourth part of what he was worth to a woman. Census was likewise used in other senses: as, 1. For the book or register wherein the professions of the people were entered; and which was frequently cited and appealed to, as evidence in the courts of justice. 2. A man's whole substance or estate. 3. A tax on persons, or a capitation tax. See Capite.

Census Duplicatus, a double rent, paid by vassals to their lords on extraordinary occasions; as expeditions to the Holy Land, &c.

Census Ecclesiæ Romanæ, an annual contribution voluntarily paid to the see of Rome by the several princes of Europe.

Census Equester, in Roman antiquity, the estate of a knight, rated at 400,000 sesterces, which was required to qualify a person for that order, and without which no virtue or merit was available.

Census Senatorius, the patrimony of a senator, was limited to a certain value; being at first rated at 800,000 sesterces, but afterwards, under Augustus, enlarged to 1,200,000.

CENT. Lat. *centum*, a hundred. Five per cent; that is so much by, or for, the hundred.

CE'NTAUR, *n.* }
Ce'ntaur-like, *adj.* } A poetical being, supposed to be compounded of the upper part of
Ce'ntaury, *n.* }
a man, and the lower part of a horse; the sign Sagittarius in the zodiac. For the plant centaury, see Centaurea.

Down from the waist they are *centaurs*, though women all above. *Shakspeare.*

He, as if, *centaur-like*, he had been one piece with his horse. *Sidney.*

The idea of a *centaur* has no more falsehood in it than the name *centaur*. *Locke.*

Add pounded galls, and roses dry,
And with Cecropian thyme strong scented *centaury*.
Dryden.

The chearless empire of the sky
To Capricorn the *Centaur* archer yields.
Thomson.

Centaur, in astronomy, a part of a southern constellation, usually joined with the wolf. See Astronomy.

Centaurs, in mythology, from κεντεω, to gall, and ταυρος, a bull; fabulous monsters, half men and half horses. The poets pretend that the centaurs were the sons of Ixion and a cloud: the reason of which fancy is, that the people so named retired to a castle, called νεφελη, which signifies a cloud. Some will have the centaurs to have been a body of shepherds and herdsmen, rich in cattle, who inhabited the mountains of Arcadia, and to whom is attributed the invention of bucolic poetry. Palæphætus, in his book of Incredibles, relates that, in the reign of Ixion, king of Thessaly, a herd of bulls on mount Thessalus ran mad, and ravaged the whole country, rendering the mountains inaccessible; that some young men who had found out the art of taming and mounting horses, undertook to clear the mountains of these animals, which they pursued on horseback, and thence obtained the appellation of centaurs. This success rendering them insolent, they insulted the Lapithæ, a people of Thessaly: and because when attacked they fled with great rapidity, it was supposed they were half horses and half men. The centaurs in reality were a tribe of Lapithæ, who inhabited the city Pelethronium, adjoining to mount Pelion, and first invented the art of breaking horses, as is intimated by Virgil.

CENTAUREA, greater centaury: a genus of the polygamia frustanea order, and syngenesia class of plants; natural order, forty-ninth; compositæ. The receptacle is bristly, the pappus simple, the cor. of the radius funnel-shaped, longer than those of the disk, and irregular. There are upwards of 131 species; of which we shall only mention two: viz. 1. C. cyanus, the blue bottle, grows commonly among corn. The expressed juice of this flower stains linen of a beautiful blue color, but is not permanent. Boyle says, that the juice of the inner petals, with a little alum, makes a beautiful permanent color, equal to ultramarine. 2. C. glastifolia. The root of this species is an article in the materia medica. It has a rough, somewhat acrid taste, and abounds with a red viscid juice. Its rough taste has gained it some esteem as an astringent; its acrimony as an aperient; and its glutinous quality as a vulnerary: but the present practice takes very little notice of it.

CENTENARIO, or Centenarius, in the middle age; 1. an officer who had the command, with the administration of justice, in a village. The centenarii were under the jurisdiction and command of the court. We find them among the Franks, Germans, Lombards, Goths, &c. 2. An officer who had the command of 100 men; more frequently called a centurion. 3. An officer, in monasteries, who had the command of 100 monks.

CE'NTENARY, *n.* }
Centen'nial, *adj.* } Lat. *centenarius*. The number of a hundred. Mason uses the word
Centi'loquy, *n.* }
centennial to denote the hundredth anniversary. Centiloquy is a collection of a hundred sayings. See Centiloquium.

In every *centenary* of years from the creation, some small abatement should have been made. *Hakewill.*

CENTININUM Ovum, i. e. the 100dth egg, among naturalists, a sort of hen's egg much smaller than ordinary, vulgarly called a cock's egg; from which it has been fabulously held that the cockatrice is produced. The name is taken from an opinion, that these are the last eggs which hens lay, having laid 100 before. They have no yolks, but in other respects differ not from common ones; having the albumen, chalazes, membranes, &c. in common with others. In the place of the yolk is found a little body like a serpent coiled up, which doubtless gave rise to the fable of the basilisk's origin from thence. Their origin is with probability ascribed by Hervey to this, that the yolks in the vitellary of the hen are exhausted before the albumina.

CENTE'SIMAL, *n.* Lat. *centesimus*. Hundredth; the next step of progression after decimal in the arithmetic of fractions.

The neglect of a few *centesimals* in the side of the cube, would bring it to an equality with the cube of a foot. *Arbuthnot on Coins.*

CENTESIMATION, a milder kind of military punishment, in cases of desertion, mutiny, and the like, when only every 100dth man is executed.

the city Pelethronium, adjoining to mount Pelion, and first invented the art of breaking horses, as is intimated by Virgil.

Their origin is with probability ascribed by Hervey to this, that the yolks in the vitellary of the hen are exhausted before the albumen.

CENTE'SIMAL, *n.* Lat. *centesimus.* Hundredth; the next step of progression after decimal in the arithmetic of fractions.

The neglect of a few *centesimals* in the side of the cube, would bring it to an equality with the cube of a foot. *Arbuthnot on Coins.*

CENTESIMATION, a milder kind of military punishment, in cases of desertion, mutiny, and the like, when only every 100dth man is executed.

CENTESIMA USURA, that wherein the interest in 100 months became equal to the principal: i. e. where the money is laid out at one per cent. per month; answering to what in our style would be called twelve per cent.; for the Romans reckoned their interest not by the year, but by the month.

CENTIFO'LIOUS, *adj.* from Lat. *centum* and *folium.* Having an hundred leaves.

CENTILOQUIUM, a collection of 100 sentences, opinions, or sayings. The Centiloquium of Hermes, contains 100 aphorisms, or astrological sentences, supposed to have been written by some Arab, and falsely fathered on Hermes Trismegistus. It is only extant in Latin, in which it has several times been printed. The Centiloquium of Ptolemy is a famous astrological piece, frequently confounded with the former, consisting likewise of 100 sentences, divided into short aphorisms.

CE'NTINEL. See SENTINEL.

CE'NTIPEDE, *n.* Lat. from *centum* and *pes.* A poisonous insect in the West Indies, commonly called by the English *forty legs.*

CENTIPEDE WORMS, such as have a great many feet, though the number does not amount to 100, as the term imports.

CENTIPES. See SCOLOPENDRA.

CENTO, n. Lat. *cento.* A composition formed by joining scraps from other authors.

It is quilted, as it were, out of shreds of divers poets, such as scholars call a *cento.* *Camden's Rem.*

This hath made it to be suspected of too much compliance with that church, and her offices of devotion, and that it is a very *cento* composed out of the Mass book, Pontifical, Breviaries, Manuals, and Portuises of the Roman church. *Jer. Taylor.*

If any man think the poem a *cento,* our poet will but have done the same in jest which Boileau did in earnest. *Advertisement to Pope's Dunciad.*

CENTONARII, in antiquity, certain of the Roman army, who provided different sorts of stuff called centones, used to quench the fire which the enemies' engines threw into the camp.

CE'NTRE, *v.* & *n.*
CE'NTRAL, *adj.*
CENTRA'LITY, *n.*
CE'NTRALLY, *adv.*
CE'NTRICAL, or
CE'NTRICLE, *adj.*
CE'NTRICALLY, *adv.*
CE'NTRICALNESS, *n.*
CENTRI'FUGAL, *adj.*
CENTRI'PETAL, *adj.*

Lat. *centrum; κεντρον.* That point which is equidistant from every part of the circumference. The verb, and all its kindred words, partake of, or have reference to, this meaning. To centre is to fix on a centre; to collect, and be collected, to a point; to rest on; to be placed in the midst. Centrifugal signifies flying from a centre; centripetal, having a tendency towards it.

The heavens themselves, the planets, and this *centre,*
Observe degree, priority, and place. *Shakspeare.*

He that has light within his own clear breast,
May sit i' the *centre,* and enjoy bright day.
But he that hides a dark soul and foul thoughts,
Benighted walks under the mid-day sun;
Himself is his own dungeon. *Milton.*

As God in heaven
Is *centre,* yet extends to all; so thou
Centring receivest from all those orbs. *Id.*

One foot he *centred,* and the other turned
Round through the vast profundity obscure. *Id.*

Some that have deeper digged Love's mine than I,
Say where his *centrick* happiness doth lie. *Donne.*

Do not sigh, fair nymph, for fire
Hath no wings, yet doth as hire
Till it hit against the pole;
Heaven's the *centre* of the soul. *Marvell.*

O impudent and regardful of thy own,
Whose thoughts are *centred* on thyself alone.
Dryden.

What hopes you had in Diomed, lay down;
Our hopes must *center* in ourselves alone. *Id.*

Though one of the feet most commonly bears the weight, yet the whole weight rests *centrally* upon it. *Id.*

He may take a range all the world over, and draw in all that wide air and circumference of sin and vice, and *centre* it in his own breast. *South.*

Where there is no visible truth wherein to *centre,* errour is as wide as men's fancies, and may wander to eternity. *Decay of Piety.*

There is now, and was then, a space or cavity in the *central* parts of it; so large as to give reception to that mighty mass of water. *Woodward's Natural History.*

It was attested by the visible *centring* of all the old prophecies in the person of Christ, and by the completion of these prophecies since, which he himself uttered. *Atterbury.*

Umbriel, a dusky melancholy sprite,
Down to the *central* earth, his proper scene,
Repairs. *Pope's Rape of the Lock.*

They described an hyperbola, by changing the *centripetal* into a *centrifugal* force. *Cheyne.*

Might not, in ancient times, the near passing of some large comet of greater magnetic power than this globe of ours, have been a means of changing its poles, and thereby wracking and deranging its surface, placing in different regions the effect of *centrifugal* force, so as to raise the waters of the sea in some, while they were depressed in others? *Id.*

His wealth, fame, honors, all that I intend,
Subsist and *centre* in one point—a friend. *Cowper.*

Through constant dread of giving truth offence,
He ties up all his hearers in suspense;
Knows what he knows, as if he knew it not,
What he remembers seems to have forgot:
His sole opinion, whatsoe'er befall,
Centring at last in having none at a. . *Id.*

Thou chief star!
Centre of many stars! which makest our earth
Endurable, and temperest the hues
And hearts of all who walk within thy rays!
Byron.

CENTRE OF A SPHERE, a point in the middle, from which all lines drawn to the surface are equal.

CENTRE OF GRAVITY, in mechanics, that point about which all the parts of a body do in any situation exactly balance each other.

CENTRE OF MOTION, that point which remains at rest, while all the other parts of a body move about it.

CENTRIFUGAL FORCE. See MECHANICS.

CENTRIPETAL FORCE. See MECHANICS.

CENTRISCUS, in ichthyology, a genus of fishes belonging to the order of amphibia nantes. The head gradually ends in a narrow snout, the aperture is broad and flat; the belly is carinated; and the belly fins united. There are three species, viz. 1. C. scolopax, with a rough scabrous body, and a straight extended tail. It has two ventral fins, with four rays in each, but no teeth.

It is found in the Mediterranean. 2. C. scutatatus has its back covered with a smooth bony shell, which ends in a sharp spine, under which is the tail; but the back fins are between the tail and the spine. It is a native of the East Indies. 3. C. valitarus, body oblong, lanceolate and rough, with small recumbent bristles at the nostrils. A native of Amboyna.

CENTRY. See Sentinel.

CENTUMCELLÆ, in ancient geography, Trajan's villa in Tuscany, on the coast, three miles from Algæ; with an excellent port, called Trajanus Portus; and a factitious island at the mouth of the port, made with a huge block of stone, on which two turrets rose, with two entrances into the basin or harbor. It is now called Civita Vecchia. Long. 11° 51′ E., lat. 42° 5′ N.

CENTUMVIRI, in Roman antiquity, judges appointed to decide common causes among the people: they were chosen, three out of each tribe; and, though 105 in number, were called centumviri, from the round number centum, an hundred.

CENTUNCULUS, in botany, a genus of the monogynia order, and tetrandria class of plants; natural order twentieth, rotacea: cal. quadrifid: cor. quadrifid, and patent; the stamina are short: caps. is unilocular, cut round or parting horizontally.

CE'NTUPLE, *v.* & *adj.* } Lat. *centuplex*. A
Centu'plicate, *v.* } hundred fold; to multiply a hundred fold.

> Then would he *centuple* thy former store,
> And make thee far more happy than before.
> *Sandys.*

CENTU'RIATE, *v.* Lat. *centurio*. To divide into hundreds.

CENTURIA'TOR, *n.* From century. A name given to historians who distinguish times by centuries; which is generally the method of ecclesiastical history.

> The *centuriators* of Magdeburg were the first that discovered this grand imposture. *Ayliffe's Parergon.*

CENTU'RION, *n.* Lat. *centurio*. A Roman military officer, who had the command of a hundred men.

> And the *centurion* and thei that weren with him kepynge Jhesus whann thei sighen the erthe ochalyng, and the thinges that weren do so, thei dredden gretly and seiden, verily this was Goddis sone. *Wiclif's New Testament. Matt.* xxvii.

> And he commanded a *centurion* to keep Paul, and to let him have liberty, and that he should forbid none of his acquaintance to minister or come unto him. *Acts* xxiv. 23.

> Have an army ready, say you?—A most royal one. The *centurions* and their charges distinctly billetted in the entertainment, and to be on foot at an hour's warning. *Shakspeare.*

Centurions, in Roman antiquity. See Manipulus. Every one of the thirty manipuli in a legion was divided into two ordines, or centuries. Every manipulus was allowed two centurions, one to each century· and, to determine the point of priority between them, they were created at two different elections. The thirty who were made first always took the precedency of their fellows; and therefore commanded the right hand, as the others did the left. The triarii had their centurions elected first, next to them the principes, and afterwards the hastati. Primi ordines is sometimes used in historians for the centurions of these orders; and the centurions are sometimes styled principes ordinum, and principes centurionem. These distinctions afforded a wide field for promotion: first through all the orders of the hastati; then through the principes; and afterwards from the last order of the triarii to the primipilus, the most honorable of the centurions.

CENTURIPA, Centuripe, or Centoripa, in ancient geography, a town on the south-west of the territory of Ætna, on the river Cyamosorus: now call Centurippi. It was a democratical city, which, like Syracuse, received its liberty from Timoleon. Its inhabitants cultivated the fine arts, particularly sculpture and engraving. It was taken by the Romans, plundered and oppressed by Verres, destroyed by Pompey, and restored by Octavius, who made it the residence of a Roman colony. In digging for the remains of antiquities, cameos are no where found in such abundançe as at Centurippi and its environs. The situation of the place is romantic: it is built on the summit of a vast group of rocks, which was probably chosen as the most difficult of access, and consequently the safest in times of civil commotion. The remains still existing of its ancient bridge are a proof of its having been once a considerable city.

CE'NTURY. Lat. *centuria*. A hundred. The word is most frequently applied to specify time; but is also used to signify number merely; as in a 'century of inventions.'

> When with wood leaves and weeds I've strewed
> his grave,
> And on it said a *century* of prayers,
> Such as I can, twice o'er, I'll weep and sigh.
> *Shakspeare.*

> The nature of eternity is such, that though our joys after some *centuries* of years may seem to have grown older by having been enjoyed so many ages, yet will they really still continue new. *Boyle.*

> And now time's whiter series is begun,
> Which in soft *centuries* shall smoothly run.
> *Dryden.*

> Romulus, as you may read, did divide the Romans into tribes, and the tribes into *centuries* or hundreds. *Spencer.*

> The lists of bishops are filled with greater numbers than one would expect; but the succession was quick in the three first *centuries*, because the bishop often ended in the martyr. *Addison.*

> When we see men grow old, and die at a certain time from one another, from *century* to *century*, we laugh at the elixir that promises to prolong life a thousand years. *Johnson.*

Century, in antiquity. The Roman people, when assembled for electing magistrates, enacting laws, or deliberating upon any public affair, were always divided into centuries, and voted by centuries, that their votes might be the more easily collected, whence these assemblies were called comitia centuriata. The Roman cohorts were also divided into centuries. See Centurion, and Cohort.

CEODES, in botany, a genus of the diœcia order, belonging to the polygamia class of plants: CAL. none: COR. monopetalous, with a short terminated tube; the stamina are ten subulated filaments; the antheræ roundish.

CEOL, an initial in the names of men, which signifies a ship or vessel, such as those that the Saxons landed in.

CEORLES, one of the classes into which the people were distinguished among the Anglo-Saxons. The ceorles, who were persons completely free, and descended from a long race of freemen, constituted a middle class between the laborers and mechanics (who were generally slaves, or descended from slaves), on the one hand, and the nobility on the other. They might go where they pleased, and pursue any way of life that was most agreeable to their humor; but so many of them applied to agriculture, and farming the lands of the nobility, that a ceorl was the most common name for a husbandman or farmer in the Anglo-Saxon times. They seem in general to have been a kind of gentleman farmers; and if any one of them acquired the property of five hides of land, upon which he had a church, a kitchen, a bell-house, and a great gate, and obtained a seat and office in the king's court, he was esteemed a nobleman or thane. If a ceorl applied to learning, and attained to priest's orders, he was also considered as a thane; his weregild, or price of his life, was the same, and his testimony had the same weight in a court of justice. When he applied to trade, and made three voyages beyond sea, in a ship of his own, and with a cargo belonging to himself, he was also advanced to the dignity of a thane. But if a ceorl inclined to arms, he became the sithcundman, or military retainer, to some potent and warlike earl, and was called the huscarle of such an earl. If one of these huscarles acquitted himself so well as to obtain from his patron either five hides of land, or a gilt sword, helmet, and breastplate, as a reward of his valor, he was likewise considered as a thane. Thus the temple of honor stood open to these ceorles, whether they applied to agriculture, commerce, letters, or arms, which were then the only professions esteemed worthy of a freeman.

CEOS, CEA, CIA, or COS, in ancient geography, one of the Cyclades, opposite to Sunium, in Achaia. It is fifty miles in compass, and is commended by the ancients for its fertility and richness of its pasture. The first silk stuffs, according to Pliny and Solinus, were wrought here. Ceos was particularly famous for excellent figs. It was first peopled by Aristæus, the son of Apollo and Cyrene, who, being grieved for the death of his son, Actæon, retired from Thebes, at the persuasion of his mother, and went over with some Thebans to Ceos, at that time uninhabited. Diodorus Siculus tells us, that he retired to the island of Cos; but the ancients, as Servitus observes, called both these islands by the name of Cos. Ceos became so populous, that a law was made, commanding all persons upwards of sixty to be poisoned, that others might be able to subsist: so that none above sixty were seen to be in the island, being obliged, after they arrived at that age, either to submit to the law, or abandon the country, together with their effects. Ceos had, in former times, four famous cities, viz. Julis, Carthæa, Coressus, and Præessa. The two latter were, according to Pliny, swallowed up by an earthquake. The other two flourished in Strabo's time. Carthæa stood on a rising ground, at the end of a valley, about three miles from the sea. The situation of it agrees with that of the present town of Zia, which gives name to the whole island. The ruins both of Carthæa and Julis are still remaining; those of the latter take up the whole mountain, and are called by the modern inhabitants Polis, that is, the city. See POLIS. Ceos was, with the other Greek islands, subdued by the Romans, and bestowed upon the Athenians by Marc Antony the triumvir, together with Ægina, Tinos, and some other adjoining islands, which were all reduced to one Roman province by Vespasian. The island is now called Zia.

CE'PHALALGY, *n.* Κεφαλαλγία. The headache.

CEPHALANTHUS, button-wood, a genus of the monogynia order, and tetrandria class of plants; natural order forty-eighth, aggregatæ. No common calyx; the proper one is superior, and funnel-shaped; the receptacle globose and naked, with one downy seed. There are five species, natives of the East Indies, the principal is C. occidentalis, a deciduous shrub, native of North America. It grows to about five or six feet high; and is not a very bushy plant, as the branches are always placed thinly in proportion to the size of the leaves, which will grow more than three inches long, and one and a half broad, if the trees are planted in a proper soil. The leaves stand opposite by pairs on the twigs, and sometimes by threes, and are of a light-green color: their upper surface is smooth; they have a strong nerve running from that on each side to the borders. These, as well as the foot-stalk in autumn, dye a reddish color. The flowers, which are aggregate, are produced at the ends of the branches, in globular heads, in July. The florets which compose these heads are funnel-shaped, of a yellow color, and fastened to an axis on the middle.

CEPHALENIA, or CEPHALLENIA, an island of the Ionian sea, between Ithaca and Zacynthus, known in Homer's time by the names of Samos and Epirus Melæna. It is about eighty miles long, forty broad, and 130 in compass. It had anciently four cities. Strabo tells us, that in his time there were only two cities remaining; but Pliny speaks of three, adding, that the ruins of Same, the metropolis, which had been destroyed by the Romans, were still in being. The names of the four cities were, according to Thucydides, Same, Prone, Cranii, and Palæ. This island was subdued by the Thebans, under Amphitryo, who is said to have killed Pterelas, who then reigned in it. While Amphitryo was carrying on the war in Cephalenia, then called Samos, Cephalus, having accidentally killed his wife Procris, fled to Amphitryo, who received him, and made him governor of the island, which thenceforth was called Cephalenia. After it had been long subject to the Thebans, it fell under the dominion of the Macedonians, and was taken from them by the Ætolians, who held it till it

was reduced by M. Fulvius Nobilior; who, having gained the metropolis after a siege of four months, sold all the citizens for slaves, adding the whole island to the dominions of Rome. It is now called Cephalonia.

CEPHA'LICK, *adj.* Κεφαλή. That which is medicinal to the head.

> *Cephalick* are all such as attenuate the blood, so as to make it circulate easily through the capillary vessels of the brain. *Arbuthnot on Aliment.*
>
> I dressed him up with soft folded linen, dipped in a *cephalick* balsam. *Wiseman.*

Cephalic Medicines comprehend cordials, with whatever promotes a free circulation of the blood through the brain. Except when the disorder arises from excess of heat, of an inflammatory disposition in the head, moist topicals should never be used; but always dry ones. To rub the head after it is shaved proves an instantaneous cure for a cephalalgia, a stuffing of the head, and a weakness of the eyes, arising from a weak and relaxed state of the fibres.

Cephalic Vein, in anatomy, creeps along the arm between the skin and the muscles, and divides it into two branches; the external goes down to the wrist, where it joins the basilica, and turns up to the back of the hand; the internal branch, together with a small one of the basilica, makes the mediana. See Anatomy. The ancients used to open this vein for disorders of the head, for which reason it bears this name; but a better acquaintance with the circulation of the blood informs us, that there is no foundation for such a notion.

CEPHALONOMANTIA, from κεφαλα, ονος, an ass, and μαντεια. A method of divination, by an ass's head broiled on the coals. After muttering a few prayers, the names of several persons suspected of a theft, or the like, were repeated over; he at whose name the ass's jaws made any motion, was held convicted.

CEPHALUS, in fabulous history, an Athenian hero, who married Procris, the daughter of Pandion, king of Athens. Ovid represents him as having been so beautiful, that Aurora fell in love with him; but, at the same time, as so constant to his wife, that even the charms of the rosy goddess could not prevail on him to break his nuptial vow: whereupon Aurora changed his form to that of another man. His wife gave him a javelin, which had the peculiar property of never missing its aim;—a property which proved fatal to herself;—for, one day being out in a wood, where he was hunting, he, mistaking her among the rustling leaves, for a wild beast, killed her with it. Ovid narrates his adventures at large, with the metamorphosis of his dog into a stone, &c. *Metam. Lib.* vii. *Fab.* 25—28.

CEPHEUS, in fabulous history, a king of Arcadia, on whose head Minerva fastening one of Medusa's hairs, he was rendered invincible.

CERAM, an island of the eastern seas, between 160 and 180 miles in length, and about forty in breadth. A chain of mountains, from 6500 to 7000 feet high, intersects it longitudinally. The sago tree is found here in large forests. Wild hogs and deer are also numerous, and birds of paradise, together with a bird called the salangan. The natives, who are said to be a cruel and ferocious race, confine themselves to the interior; but the island is under the dominion of chiefs acknowledging the rule of the Dutch, who have destroyed most of the clove trees. Many singular stories are told of the natives. They are a stout and strong race, it is said, and so active, that they run down the wild hogs. Their clothing is only a bandage of cloth of the bark of a tree round the loins; their arms, a bamboo sword, and bow and arrows. The qualification for marriage in the men is the production of the head of a person whom they have treacherously murdered; nor can they build a new house until they have destroyed an enemy. The heads thus collected, after being triumphantly exposed in the villages, are conveyed to the inmost recesses of the woods, where their idolatrous rites are performed, and where, says Rumphius, 'the devil answers their questions, and often carries away some of them, especially children, for three or four months, when he brings them back, after having presented them with certain presents.' Valentyn informs us that parents deliver their children to the priests, to be instructed in the religion of the demon they worship; and the priests receiving the children in the darkest recess of their leafy temples, the parents are made to believe that they are sacrificed by the dismal screams they hear, and by the bloody spears being thrust through the roof of the temple. In three or four months, however, they are returned to them with presents of some Chinese copper coins on strings. The principal food of these tribes is the wild animals of the woods, rats and snakes. They take but one wife, to whom they are constant. The island has several good ports, particularly Lahoo, near the south-west end, where the Dutch had formerly a resident; Sawa, on the north, and Wakoo on the north-east.

CERAMBYX, in zoology, a genus of insects of the beetle kind, belonging to the order of insecta coleoptera. The antennæ are long and small; the breast is spinous or gibbous; and the elytra are linear. Linnæus enumerates eighty-three species, chiefly distinguished by the figure of the breast.

CERA'STES, *n.* Κεραστης. A serpent having horns, or supposed to have them.

> Scorpion, and asp, and amphisbena dire,
> *Cerastes* horned, hydrus, and elops drear. *Milton.*

Cerastes, in zoology, the trivial name of a species of anguis and coluber.

CERASTIUM, mouse-ear: a genus of the pentagynia order and decandria class of plants; natural order twenty-second, carophylleæ: cal. pentaphyllous; the petals are bifid: caps. is unilocular, and opening at the top. There are twenty-two known species, but none of them possessed of any remarkable property, growing wild in all parts of the world.

CE'RATE, *n. s.* Lat. *cera*, wax. A medicine made of wax, which, with oil, or some softer substance, makes a consistence softer than a plaster. *Quincy.* See Pharmacy.

Ce'rated, *adj.* Lat. *ceratus*. Waxed; covered with wax.

Ceration, the name given by the ancients to the small seeds of ceratonia used by the Arabian physicians as a weight to adjust the doses of ith us took its

IA, CERAUNIAS, or CERAUNIUS
atural history, from κεραυνος, a thun-
sort of flinty stone, of no certain
of a pyramidal or wedge-like figure ;
supposed to fall from the clouds in the
under-storms, and to be possessed of
table virtues, as promoting sleep, pre-
rom lightning, &c. The ceraunia is the
th the thunder-stone, or arrow's head.
re frequently confounded with the ombriæ
ontiæ, as being all supposed to have the
origin. Most naturalists take the ceraunia
native stone, formed among the pyrites, of
ne, concrete, mineral juice. Mercatus and
Woodward assert it to be artificial, and to
e been thus fashioned by tools. The ceraunia,
ording to these authors, are the heads of the
cient weapons of war, in use before the inven-
n of iron : which, upon the introduction of
at metal, growing into disuse, were dispersed
n the fields through different countries. Some
of them had possibly served in the early ages
for axes, others for wedges, others for chissels ;
but the greater part for arrow-heads, darts, and
lances. The ceraunia is also held by Pliny for
a white or crystal-colored gem, that attracted
lightning to itself. What this was, is hard to
say. Prudentius also speaks of a yellow ce-
raunia ; by which he is supposed to mean the
carbuncle or pyropus.

CERBERA, in botany, a genus of the monogynia order, and pentandria class of plants; natural order thirtieth, contortæ : COR. contorted. The fruit a monospermous plum. The most remarkable species is C. atrouai, a native of the warm parts of America. It rises with an irregular stem to eight or ten feet, sending out many crooked diffused branches, which towards their tops are garnished with thick succulent leaves of a lucid green, smooth and very full of a milky juice. The flowers come out in loose bunches at the end of the branches : they are of a cream color, having long narrow tubes, and at the top are cut into five obtuse segments, which seem twisted, so as to stand oblique to the tube. The wood of this tree smells very foully, and the kernels of the nuts are deadly poison, to which there is no antidote ; so that the Indians will not even use the wood for fuel.

CERBERUS, in mythology, a three-headed mastiff, the son of Typhon and Echidna, and placed to guard the gates of hell. He fawned upon those who entered, but devoured all who attempted to get back He was, however, mastered by Hercules, who dragged him up to the earth, when, in struggling, a foam dropped from his mouth, which produced the poisonous herb called aconite, or wolf's-bane. Some have supposed that Cerberus is the symbol of the earth, or of all-devouring time : and that its three mouths represent the present, past, and future. The victory obtained by Hercules over this monster, denotes the conquest which this hero acquired over his passions. Mr. Bryant supposes that Cerberus was the name of a place, and that it signified the temple of the sun ; deriving it from kir abor, the place of light. This temple was also called Tor Caph-El, which was changed to τρικηφαλος; and hence Cerberus was supposed to have had three heads. It was likewise called tor keren, turris regia; whence τρι καρηνος, from τρεις, three, and καρηνον, head.

CERCIS, the Judas tree, a genus of the monogynia order, and decandria class of plants; natural order thirty-third, lomentaceæ : CAL. is quinquedentated, and gibbous below : COR. papilionaceous, with a short vexillum or flag petal under the wings or side petals; a leguminous plant. There are only two species, both deciduous. 1. C. Canadensis, or Canadian cercis, will grow to the size of the first sort in some places. The branches are also irregular. The leaves are cordated downy, and alternate. The flowers are usually of a palish red, and show themselves in spring, before the leaves are grown to their size. These too are often eaten in sallads, and afford an excellent pickle. There is a variety of this with deep red, and another with purpl flowers. These trees not only exhibit their flowers in clusters, in different colors, early in spring, before the leaves are grown to such a size as to hide them ; but also afford a pleasing variety, from the difference of the upper and lower surface of the leaves, the one being of a fine green, the other of a hoary cast, which the waving winds present alternately to view. 2. C. siliquastrum, common Judas tree, or Italian cercis, a native of Italy and other parts of the south of Europe.

CERDON, a Syrian, who, being accused of Manicheism, came to Rome in the time of pope Hyginus, and abjured his errors about A. D. 56; but was afterwards convicted of persisting in them, and cast out of the church. Cerdon asserted two principles, the one good and the other evil. This last, according to him, was the creator of the world, and the god that appeared under the old law. The first, whom he called unknown, was the father of Jesus Christ; who, he taught, was incarnate only in appearance, and was not born of a virgin; nor did he suffer death but in appearance. He denied the resurrection; and rejected all the books of the Old Testament, as coming from an evil principle. Marcion was his disciple.

CERDONIANS, ancient heretics, who maintained most of the errors of Simon Magus, Saturninus, and the Manichees, so named from their leader Cerdon.

CERE, *v.*
CE'REOUS,
CE'RECLOTH, *n.*
CE'REMENT, *n.*

Ar. *kir*; Chald. *kera*; Κηρός; Lat. *cera*, wax. To wax; waxy; a cloth smeared with waxy or gummy substances, to be applied to wounds; cloths dipped in melted wax, in which dead bodies were wrapped, after having been embalmed.

The ancient Egyptian mummies were shrouded in a number of folds of linen, besmeared with gums, in manner of *cerecloth*. *Bacon.*

Let me not burst in ignorance, but tell
Why canonized bones, hearsed in earth,
Have burst their *cerements?* *Shakspeare.*

You ought to pierce the skin with a needle, and strong brown thread *cered*, about half an inch from the edges of the lips. *Wiseman.*

The tyranny of silence is not lasting,
And though events be hidden, just men's groans
Will burst all *cerement*, even a living grave!
Byron. The Two Foscari.
